## *Architecture at the Paris Salons.*

THE architectural drawings at the Old Salon are of more general interest than last year, as there is more variety and a greater proportion of drawings representing executed work; there seem at last to be some signs of a reaction against the hitherto almost exclusive attention to ideal *projets* and restorations of classical buildings. Not that these latter are not of interest, but one wants to have some representation also of the architecture of the present day, instead of living entirely in an ideal.

It must be admitted, nevertheless, that the monumental sets of drawings of an ancient temple restored, one of which has usually appeared in the architectural room, have in general formed the most attractive item in the show. This year the place is taken by M. Boutron, a pupil of MM. Guadet and Raulin, who exhibits a set of drawings of "État Actuel et Restauration des Thermes d'Augusta Trevirorum (IV^e^ siècle)." These are not such huge and striking drawings as one has sometimes seen in this class of exhibit, but they are a very fine set and highly creditable both to the industry and inventive faculty of the author, since they are built on a very small foundation of fact, the perspective of the actual state of the ruins showing indeed a nearly complete plan, but little remaining of the walls above the surface of the ground. Nevertheless, this performance has its value and interest; no one could have built up such a structure on the basis of these scanty remains without preparing for it by a most thorough study of Roman architecture, which is riveted in the memory by the application of it in the drawings. The perspective section of the restored building is, as usual with French architects, an admirable piece of draughtsmanship. The author also adds some very well executed water-colour sketches of capitals and fragments of sculpture found on the site. Another contributor to classic restoration is M. Chaussemiche, who sends some fine drawings of the details of the Temple of Mars Ultor, and some studies in Renaissance architecture, of which those of a house in Rome, and a large clean line drawing of a monument (name not given) are especially praiseworthy.

Among designs which are obviously for ideal and not for practical purposes there are some that are not without interest. M. Despeyroux, for instance, exhibits a perspective view and detail drawings of "Un Amphithéâtre pour les Oraisons Funèbres," a rather striking conception, and, considering how fond the French are of funeral orations over the graves of eminent men, not without its practical significance. The design is French neo-Greek, and shows an architectural wall or screen forming a segment of a circle, while facing its concave side is a stone amphitheatre for the "assistance." The bier is supposed to be placed on the chord of the arc formed by the screen wall, the speaker to stand probably behind it, the concave wall assisting to throw forward the sound of his voice. This is a rather new idea and, from the French point of view at all events, is really of some value, though it would be of little use in England, where we preach sermons or write articles on deceased persons, but do not make speeches over their graves. The drawback to the design is the same that meets us constantly in modern French design of the Classic type viz.: the peculiar style of detail which seems to have been evolved by academical training working on a basis of study of the antique. It is difficult to define exactly in what the objectionable character of this academical classic architecture consists; perhaps it may be said that the most prominent characteristics are a coarseness in the mouldings, and a peculiar manner in which details of various kinds seem to be affixed to the design, as if they were nailed on, rather than forming an integral portion of it. These characteristics are not seen at their worst in M. Despeyroux' design just mentioned; we find them rampant, however, in other and larger drawings, such as the design for "Un Casino," by M. Narjoux, or in M. Hulot's immense and visionary scheme for "Une Église Votive"—a stupendous façade on a mountain of a podium, with flights of steps in front and a sloping carriage road at each side; as for ecclesiastical character, according to English feeling, there is none. A more reasonable and interesting design among the class of *projets* is that of that able architect, M. Loviot, for "Une Grande Salle des Fêtes et Cérémonies et une Exposition de l'Agriculture et des Aliments," proposed to be formed within the Galerie des Machines for next year's Exhibition. This is a construction, elliptical on plan, proposed to be erected on the floor of the gallery in question, near its western extremity, to be built up of carpentry and "staff" and requiring no foundations. The design shows a great neo-Classic screen with an order and a colossal gilt statue in the centre, with the elliptical area in front of it defined by an enclosing arcade on each side, the "Exposition des Aliments" to be in the galleries over the arcade. The characteristic promise is added, "un nombre illimité de personnes peut assister aux cérémonies"; so like the French passion for functions on a great scale. There is probably no intention of carrying out the scheme; it is a bid on the part of the architect; but as a design for a temporary exhibition structure it is highly creditable to his talents, the only drawback being that same disagreeable type of neo-Classic detail which has been nourished by the École des Beaux-Arts.

Among other designs worth mention is that by M. Félix Debat for "Un Cercle de Jeunes Artistes et Littérateurs," which certainly must be a club on a remarkably extensive scale, to judge from the scale of the building. This is probably a design made for a Beaux-Arts competition, and if so, serves as an illustration of the mistaken policy on which the architectural school is conducted, by which students are encouraged to treat in an ideal and wholly impossible fashion subjects which ought to be limited to what would be likely to be practically required and carried out. Our own students' competitions at the Royal Academy, though the results look very tame and even feeble in comparison with the grandiose drawings of the French students, have this at all events to recommend them, that they are usually such buildings as could under practical conditions be actually built. M. Debat's design, however, deserves recognition as a fine conception and as showing greater refinement of detail than many of the Classic designs. We may contrast with this the drawings of what seems to be an actual club-house, of a special character, by M. Garin : "Société Nautique de T—— sur L——; Cercle et Pavillon des Régates." It is true that the suppression of the name of the site looks rather suspicious, as if this also were an imaginary design; but at all events it is one that could be carried out, and as a design for a regatta club-house it is an excellent example of the faculty which one frequently sees so well illustrated in French architecture, of giving a special character to a building as expressive of a special purpose. This is a picturesque erection consisting of a centre square pavilion and a smaller one at each end, connected by long galleries intervening; the centre pavilion is treated as a square tower with battered sides, apparently finished externally in white cement, the end ones forming similar but lower towers, and each of them surrounded at the same height with a timber railed gallery, bracketted out on sloping timber struts; a similar gallery is repeated at the top of the centre tower: these projecting galleries, with the sloping struts, recall the appearance of the "tops" in a large square-rigged ship, the whole being a kind of shiplike house, and exactly expressing the idea of a nautical club-house. A "Salle de Concert" by M. Mirbeck, with a circular auditorium and an elliptical vestibule, has merit as a design, but is not a practical plan, especially in the orchestra, which is a theatre stall rather than an orchestra for a concert-room. Two or three designs for a "Salle de Séances Publiques, pour l'Institut," seem to show that there has been a competition of some kind for this class of building; that by M. Bouvier is more noticeable for stateliness than for convenience of plan, but the elevation is in a purer Classic style than we generally find among these drawings. A design for the same purpose by M. Moisand, a neo-Classic building with a large low dome and a large vestibule in the form of a narthex, is worth notice, chiefly for the masterly way in which the effect of the interior is indicated in the coloured sections; not very highly finished but most effective in handling, and quite supplying the place of an interior perspective. Among the same class of exhibits we may mention M. Chifflot's very fine design for "Une Salle de Concerts dans un Parc," the main feature of which is a dome with a very large centre skylight, the remainder of the surface treated in faïence in the same way that the domes of two of the 1889 Exhibition buildings were treated by M. Formigé. The domed centre compartment is surrounded by an arcaded cloister with an engaged order between the arches, interrupted at the cardinal points by a massive vestibule, with an entrance arch, with coloured mosaic decorations above the doorways. It is a kind of building far too sumptuous to be carried out on an economic basis by any private company or owner, but it is certainly a very interesting design in an architectural sense.

To come to some of the buildings either executed or of the "probable, possible sort," we find a most practical building in the "Entrepôt pour la Chamber de Commerce, Dunkerque," by M. Friésé; a great oblong block of brick warehouse, the windows deeply recessed, in sets, between wide and massive brick piers, and crowned with an oversailing parapet on boldly projecting brick corbels, connected by arches. The angle pinnacles are ugly, but not without character, and the whole is a good honest piece of brick building in a bold and massive manner. Another and more interesting exhibit is the church of Sainte-Clothilde at Reims, by M. Gosset; a church built under the auspices of Cardinal Langénieux, as a commemorative movement of the centenary 1896 (centenary of what ?). This is a far more grave and severe style of ecclesiastical building than we generally find among modern French church designs; Byzantine in style, and with something of the simplicity of genuine Byzantine architecture; not the restless, fidgety manner which we see in the neo-Byzantine style which is rather in favour for modern French churches. The plan is a tri-apsidal one of three equal apses, to east, north, and south of the centre space, with a very short square nave in front; the materials are brick and stone, with long very simply treated windows rising to the roof-springing. The centre space is covered by a semi-circular masonry dome, above which is an iron-framed dome as an exterior feature, the proportions between inner and outer dome being about the same as at St. Mark's. The sections show an elaborate system of mosaic decoration. Altogether this is a notable church design. Near this is M. Laborey's church of Notre-Dame de Sion, at Trieste, a modern Gothic church in stone, with the plan with small aisles for passage only, hitherto less common in modern churches in France than in England. The triforium gallery over the narrow aisles is carried on elliptical arches between the piers, and fenced with an elaborated traceried balustrade. The interior perspectives are drawn and coloured in a most solid and finished manner. A curious point in the interior treatment is that the vaulting-ribs are decorated in colour for a distance of three or four feet from the intersection only, the colouring being then "stopped" by a gilt scroll ornament. The effect is rather piquant.

A few other church designs, either for building or restoration, may be noticed in this connexion. M. Trinquesse's "Monastère des R. P. Carmes," at Paris, is an example of a modern Romanesque church with a large cloister to eastward of it; this is the best part of the design, the details of which generally are not attractive. In M. Prioul's reconstruction and restoration of the church at Saint-Suliac (Brittany), it is difficult to say which is reconstruction and which is entirely new work, but probably the tower and spire are new; they exhibit the poorest characteristics of French modern Gothic, being hard and wiry in detail. M. Balleyguier exhibits a drawing and an "essai de restoration" of the church at Triel (Seine-et-Oise), in which the centre portion of the plan shows a most curious and inexplicable irregularity of placing of the piers, and consequent twisting of the vaulting lines, in the central portion of the plan near the crossing; it produces almost the effect of the paper being crumpled, but is evidently a careful record of facts. One would like very much to know what were the circumstances which led to this curious piece of irregularity in mediæval setting out. The nave is four-aisled, or rather, there is an extra aisle tacked on to the south side. Both in this case and in that of the Abbey Church of Redon (a restoration scheme by the same architect) we see the phenomenon of a lofty and elaborate choir with a very low nave, much lower than the choir, and in the case of Redon evidently a nave of the modern or "debased" period, replacing, in a utilitarian spirit, a loftier mediæval nave. How much of the loftier and more elaborate choir, in each case, is original and how much restoration, the drawings give no clue. Then there is a very large and elaborate set of drawings, by two architects, M. Guédy and M. Jules Viatte, for an entire rebuilding and decoration of the abbey church of Jumièges; a printed pamphlet accompanies the drawings, copies of which are offered by an emissary to any one who is detected in the act of making notes. ("Surely in vain the net is spread in the sight of any bird.") The whole is evidently a grand bid for a job from the Commission des Monuments Historiques; it is to be hoped that considerations of cost, at all events, will knock that on the head; one can hardly expect any better motive after what one has seen done under the auspices of that terrible "Commission."

Among the examples of house architecture that is actually carried out or to be carried out there are several good designs. The "Maison de Rapport" in the Rondpoint Bugeaud, by M. Gabriel Morice, shows a good plan; the exterior is in the usual style of the Parisian stone house front, in which the various examples are so alike in their general manner that there is little to distinguish between one and another; they are always dignified and rather decorative in style, but while they never sink below a certain level they unfortunately never rise above it. This general similarity in the Parisian street house architecture is no doubt one of the qualities which gives to the better class of streets in Paris their generally fine and monumental appearance, but it is accompanied by the drawback of an almost entire want of character and individuality. Among the drawings for the one now under notice is a small pen sketch of a "cheminée"—mantel and overmantel, as we should say—labelled as "style Anglaise," which under this heading will rather amuse the English visitor. The same architect's "Maison de Rapport" in the Avenue de la Grande Armée has the same kind of merit as the other example, with a plan cleverly fitted into an angle site. A house in the Avenue des Champs Elysées, by M. Friésé, is also on an angle site, and has a circular staircase well placed in the re-entering angle at the rear of the buildings, approached by a vestibule and lobby entered from the outer angle; the exterior is shown in a sumptuous perspective drawing, and is a very good example of the prevalent style. A more interesting example of house architecture than any of these is M. Juste Lisch's "Hôtel à Cognac." In this plan the main rooms of the house are included in a block of three or four stories at the left hand of the site; at the right hand is a one-story block connected with the other block by a long gallery also in one story, the floor level of which is below the ground floor level of the main block, and connected with it by steps and a gallery at the end. This would be an unusual and effective internal plan; the defect is in the staircase, which is comprised in a circular turret of rather small dimensions, and is not of sufficiently spacious character for the general style of the house. The architectural treatment differs from that of the usual French house, and may be described as the château style modernised. The extraordinary productions which the French call "maisons à campagne" are fortunately less numerous than usual, but there is one truly characteristic specimen, the "Villa" by M. Chas. des Anges, in which the treatment of the roofs gives the house the appearance of a collection of immense "poke-bonnets" of the old school. Why the French architects take pleasure in the construction of such absurdities it is impossible to understand; in designing town houses they are rational—in country houses they seem to run mad; but we presume there must be a demand on the part of owners for country houses of this burlesque type, or at all events an acquiescence in it, or they would not continue to be built.

M. Legriel exhibits a design for the rebuilding of schools, or what is usually called in France a "groupe scolaire," at Clichy, which (as usual with French schools) might be rather taken for a mill or warehouse; and the same remark applies to M. Guyon's combination of "Groupe Scolaire—Salle de Réunion, Mairie, et École Maternelle," erected last year for the Commune of St. Maurice. This appears to be a building only half carried out, to be completed by an additional block similar to that already erected. The fact that all French school designs have this prison-like and forbidding architectural expression seems to imply something very wrong in the French educational system, if the building is the reflection of the style of education. M. Bérard's "Groupe Scolaire" for the town of Stains is less objectionable in this respect—a plain white building with large windows. All these new schools are, we believe, admirably sanitated, and in this respect might be a lesson for some of our schools in England; but it is a pity that they do not exhibit any of that home-like and semi-domestic appearance which English architects rarely fail to impart to school buildings, and which certainly tends to put a pleasanter and more attractive face on education. With these may be classed M. Joanny Bernard's excellent plans of the "Ecole Supérieure de Commerce" in the Avenue de la République, consisting of two wings the ends of which front the principal street, with a lower building connecting them. There is no order here, but a plain expanse of wall with the plinth and cornice effectively designed, and the windows arranged so as to be expressive of the utilitarian requirements of the building; everything is in good taste and suitable to the object of the design.

Among other practical examples of civil architecture M. Heneux' barracks for the municipal Sapeurs-Pompiers at Montmartre is a highly creditable work, in brick with stone dressings, and treated with some architectural effect but not outstepping the utilitarian character proper to the class of building. The new children's hospital in Rue Michel-Bizot, Paris, by M. Maistrasse, is shown in a large and fine set of drawings—plans, bird's-eye view, &c.; a well planned building on the modern system, in pavilions interspersed with gardens. Among designs for civil architecture M. Devillard's competition design for the reconstruction of the Hôtel de Ville at Versailles, which received a premium in the competition, deserves notice as of more than average merit. The buildings are planned round a centre courtyard and garden; the elevation is a harmonious and well-balanced Classic design, with an order of coupled columns on a rusticated basement, and with much purer and better Classic detail than in many examples. One may contrast with this M. Henri Guillaume's design for the "Théâtre des Bonhommes Guillaume," which can only be described as clever but impudent—a piece of architectural grotesque.

Schemes for the restoration of châteaux are, as usual, rather numerous, and are in almost all cases interesting from the beautifully-executed drawings of the château as existing, which generally form part of the set. Among these are M. Lafargue's "Château d'Herbault en Sologne," in which the coloured elevation of the chequered brickwork building, with its round angle towers, reflected in the moat, is a beautifully-executed drawing, having almost the effect of a view. The plan is of that curiously naïve type of which examples are to be found in Du Cerceau—an oblong with round towers at two of the angles and angular projections at the other two, the interior being cut up into compartments in the most primitive fashion, without any regard to planning in the modern sense of the term. The towers are capped with prodigious cones of slated roof. M. Guinot's drawings for the restoration of the château of Contenson (Loire) are also a beautiful set, especially the detail elevation shaded in Indian ink. Another set of drawings which should not be passed over is the very curious and clever scheme for a sanatorium by M. Hannotin, which is apparently put forward as intended to supply the needs of the new cure for consumption by open-air living. It is a white building carried out in steel and concrete—the section of the steel framing is given, but it is invisible in the complete design—which shows a range of deeply recessed lofty arched openings running the whole height of the building, occupied by tiers of wooden galleries for sitting or lying in the open air; the back of the gallery is the windowed partition forming the front of the living room, if it can be called so, since the object is to be as much out of it as possible. The building is not only rendered very effective and original, in an architectural sense, in the drawings, but the scheme really seems to have a practical value, in spite of the odd and rather startling appearance of the design.

Among the designs of purely decorative character one is shown by a model; a monument in white marble erected at Monaco, and designed by M. Narjoux. This is an oblong tomb with a canopy supported by square battered piers at the angles; a draped figure is seated on the balustrade in front; in the rear of the podium is the entrance to the tomb, beneath a segmental pediment. M. Ledoux exhibits an interesting design for a wall decoration in fresco, in which architecture is treated decoratively; a colonnade is represented in front, with vases and flowers in each bay, with an architectural background painted as if curved on plan and in lighter tints than the front portion. The idea is novel and very well carried out. M. Delahaye's study for a "Carte de Manœuvres" (an admission ticket apparently), designed for the War Office, is a good application of decorative design to this kind of object. M. Guillaume's sketch for the monument to Henri Pille (the monument itself is exhibited in the sculpture section) consists of a stone pedestal supporting a screen which forms the background to a bronze portrait bust; the stone details are rather "lumpy," but the whole thing is well conceived. Ecclesiastical decorations, of which there are two or three examples, are mostly uninteresting and to an English eye quite the reverse of ecclesiastical in style and feeling; but no doubt there is, to vary Burke's phrase, a "geographical taste" in these things.

Among drawings illustrative of existing architecture one of the most elaborate sets is a complete measured illustration of "Les Edifices de la Place Saint Marc" at Venice, including a plan in which even the pavement is drawn out in detail. This is exhibited by M. Gromort, in collaboration with M. Louis Sue. Among others M. Ch. Chauvet exhibits a fine drawing of a decoration in faïence at Savone—an armed figure on a background of geometrical tile pattern; this forms a portion of a projected work in illustration of pavement and tile *revêtement* of the Renaissance epoch, which should be of value if all the illustrations are equal to this in interest and in completeness of execution. M. Chedanne exhibits a very fine set of drawings of Roman wall decoration in colour from various buildings; M. Ernest Gaston has a set of measured drawings of the Cistercian Abbey of Longpont; M. Adolphe Gilbert a beautiful water colour drawing of a portion of the Parthenon; M. Hista a large frame of sketches from Versailles; M. Le Feuvre illustrates the cathedral of Le Mans, including among the set a very fine perspective view; M. Monestel sends a set of drawings of the church of St. Maximin, which are quite a study of what can be done in measured drawings; and M. Morard exhibits a very large and fine shaded elevation of the tomb of Margaret of Austria in the church at Brou.

Architecture in the New Salon may be passed over in very few words, the principal drawings consisting in wild dreams, or rather nightmares, such as the "Temples pour les Religions Futures" by M. Garas, of which the less said the better. In the section of architecture is included, however, a sketch model of a really fine monument to Puvis de Chavannes, in which the artist is represented as seated, in classical drapery, on a rock which is supported on the upper portions of four Doric columns with their entablature, which rise from among a mass of rocks and débris; there is a symbolism about this which is impressive. In the architectural section here are included various furniture exhibits, and one or two complete furnished rooms, nearly all of which, not without cleverness, are pervaded by the false taste for twisting lines and lack of simplicity which is such a discordant element in contemporary French work of this class. In M. Serrurier's furniture and decoration of a "Salle à Manger" the furniture is full of unnecessary tricks and twists, and on the side which is supposed to be an outer wall there is a decorative frieze formed of successive stalks showing the leaves and flowers of tulip symmetrically repeated, the leaves represented by green glass and the flowers (about a foot high) by ruby glass, fixed in openings cut to the shape of the design. We may be thankful that we can see nothing as coarse as this in English work of the present day. There is a small exhibit of stained glass, mostly in very strong colour, but containing nothing worth special mention. All the interest of architectural exhibits is with the Old Salon.

## ARCHITECTURE AS A STUDY FOR WOMEN.

By an American Lady.

I BELIEVE that in England the interest of the American in the innumerable old buildings, ecclesiastical and secular, which are to be found all over the country, sometimes affords amusement to those who do not live on our side of the Atlantic; and undoubtedly the study of architecture as exemplified in English buildings is one of the greatest causes of the enjoyments of a European trip. But the more we Americans see of English architecture and English women, the more we are struck with the impression which we form that the latter do not obtain anything like the pleasure and the profit which they might do from the cathedrals, the churches, and the manor-houses of their country.

I am struck by the fact that the ordinary English girl never seems to have studied architecture, and apparently imagines that it is something dull, slow, fit only for dry-as-dust antiquarians. This is the more odd to us, for as soon as the English woman crosses the Channel, she diligently visits each cathedral that she can. But she comes to these foreign exhibitions, as I think, almost wholly uneducated in an architectural sense, and almost incapable of appreciating the characteristics of the cathedrals of foreign countries.

The more Gothic architecture is studied the more delightful it becomes, and in England there is this also to be said for its study, it can be done so easily. If one takes up the study of pictures it is necessary to find some really first-rate gallery where they can be studied. In London women have this opportunity, but the girl who lives in the country is handicapped heavily. But as regards architecture she has the same advantages as the Londoner. There are examples of every kind of Gothic architecture within short journeys. In America we have none of the English-woman's advantages, but by means of photographs we flatter ourselves that we are able so to study architecture that we are quite familiar with all the finest examples of Gothic architecture in England.

But what I desire to establish is the fact that the English girl, by want of systematic study of architecture, positively minimises the pleasures of life. In the dullest country district in England there is usually some church which can be visited by rail or by bicycle, and what would be an aimless ride may, if there is a church at the end of it, be made an intellectual pleasure.

The study of Gothic architecture now has comparatively reasonable limits. This seems to me a great advantage, for it is thus a study which can be carried out thoroughly.

I have pointed out the advantages and pleasures of architecture as a study for women in England very imperfectly. Let me say something of our study of it in the United States. Let it be understood that the American woman never considers her education completed. Married and single women in America attend lectures and educational courses as an ordinary part of their life. But in England, when a girl is "out" she seems to consider that her education—speaking generally—is at an end. In America no such general idea prevails. In every town in America I believe I am correct in saying that there will be found one or more architectural classes got up by ladies. The teacher is usually a woman of wide culture, and in an elementary course a book such as Parker's "Introduction to the Study of Gothic Architecture" is used as a text book, and Fergusson for reference; and in addition, as I have said, photographs are largely used for illustrating lessons and lectures. For in the course of a term of these lessons there are always lectures introduced, given by teachers on the subject, who are often brought from distant places, so desirous are the students of the best instruction.

I am not now alluding either to lectures or courses in such educational centres as Smith's, Vassar, or Wellesley Colleges, which correspond to Newnham and Girton in England. I refer to classes privately organised and where the teacher is paid by the fees received from those who attend this form of instruction. The meeting of members is frequent; once a week is a common apportionment of the time. Sometimes also there are to be found private meetings got up by those interested in architecture for the discussion of some subjects, or to hear the results of a visit to Europe. In one word, an educated American girl hardly ever fails not only to have a knowledge of architecture, but to feel in it the same interest and pleasure that she does in literary subjects. I will end these remarks by an instance of this interest. I remember on one occasion crossing the Atlantic in June; the ocean was calm, so that we had all our faculties at our service. One evening a lady, who had never visited in England, gave us a charming lecture on Winchester Cathedral. After we had landed at Southampton, Winchester was the first place several of us visited; none of us had ever been there before, but we felt that the Cathedral was an old friend. It was beyond measure delightful at length to see before us a building which we had studied so often in distant Maine or Colorado.

## NOTES.

The "Theseion."

It has long been known that Dr. Bruno Sauer was at work on the many architectural and sculptural problems of the so-called "Theseion" at Athens. His book has now appeared. Dr. Sauer's name is best known in England by his investigations on the attachment marks of the pediment marbles of the Parthenon, and he has brought to bear on the problems of the "Theseion" the same scientific method that characterised his former work. It must suffice here to summarise the questions dealt with—we have the history of the temple and of the problem connected with it, the pediments, friezes, metopes and their restoration; and here we must note an admirable new departure in the matter of illustration; the actually existing remains are given in phototype plates, the conjectural restorations on a transparent sheet, which can be superimposed and then withdrawn. Thus the eye memory need never be confused—a gain which every archæologist will recognise. Next follow chapters on date, artistic character, probable school of the sculptures, on the question of the lost cult in statues, and finally on the name to be ascribed to the temple, and its relation to the topography of the Athenian. Dr. Sauer unhesitatingly names the temple the Hephaisteion. The title "Theseion" is as old as the Paris Anonymous of 1460, and has clung to the temple ever since. Ross was the first to see that it was not, and could not be a Theseion. Since then Ares, Herakles, and Hephaistes have all entered the lists. The majority refused credence to Ross, but have been since compelled to listen to Aristotle. The terms in which he describes the Theseion in the newly-discovered Athenian Politeia (c. 15) leave no doubt that the old name is wrong. Lölling, to whom Dr. Sauer dedicates his book, and who died before its completion, argued for the name Hephaisteion; this position, on architectural as well as topographical grounds, has been maintained by Dr. Dörpfeld, and now Dr. Sauer adds the argument of the pediment sculptures he has so ably succeeded in restoring.

The London Gas Inquiry.

Last week evidence was given by Mr. Charles Hunt, Chief Engineer of the Windsor-street Gas Works, Birmingham, before the Select Committee appointed to inquire into the powers of charge of the Metropolitan gas companies. Mr. Hunt appeared on behalf of the London County Council, and supported the charges against the Gas Light and Coke Company of over-capitalisation and bad management previously brought forward by Mr. Haward. Mr. Hunt considers that the existing arrangement of the Gas Light and Coke Company to supply gas south of the Thames at the same price as the South Metropolitan Company adds more than one penny per 1,000 cubic feet to the price to consumers north of the Thames, and suggests a transfer, on equitable terms, of the Gas Light and Coke Company's district south of the Thames to the South Metropolitan Company. With all due consideration of the peculiar details of the case, we fail to understand how cutting off a large and valuable district from the less successful company, and adding it to the district of its rival, can materially aid in producing a uniform gas charge throughout the Metropolis; and we should like to know what Mr. Hunt would consider "equitable terms." It is evident that the business of the Gas Light and Coke Company is less successfully managed than that of its metropolitan neighbours, and that gas consumers who are unfortunate enough to reside within the district (north of the Thames) supplied by this company are at a great disadvantage. But what arrangement can be made to force the offending company to charge less for gas, without disturbing public confidence in powers granted by Parliament, we cannot conceive.

**Electric Traction in Tunnels.** MR. P. V. MCMAHON, the Engineer to the City and South London Electric Railway, read a very able paper to the Institution of Electrical Engineers last week, on the working of electric locomotives in tunnels. The experiments he has made extend over a period of three or four years, and their accuracy is shown by the fact that in one case he accounts satisfactorily for 99 per cent. of the energy given to the locomotive, and makes a reasonable suggestion as to what becomes of the other one per cent. The results he has obtained will be useful not only in electric traction work but also in railway engineering. By analysing the curves of drawbar pull, speed and power obtained by experiment on the every-day working of the trains, he obtains very accurate values of the frictional tractive resistance. The curve showing the tractive resistance per ton at different speeds is a remarkably interesting one. The starting resistance is 40 lbs. per ton; it then rapidly diminishes to about 10 lb. per ton, and maintains this value from about five to sixteen miles per hour, it then rapidly increases and is 22 lbs. per ton at twenty-six miles per hour. These results appear high when compared with results obtained in ordinary steam main lines, but this is probably due to the skin resistance of the air on the train in a closely-fiting tunnel as well as to the column of air which is driven in front of it. The train wheels also are only about 2 ft. in diameter, which is little more than half of that of a main line carriage wheel. It will be seen that friction soon introduces a superior limit to the speed of trains in closely-fitting tunnels. The experiments showed Mr. McMahon in what direction to work in order to improve the design of his locomotives, and at the meeting next week he will read an addition to his paper, describing their latest forms and their efficiency in actual work.

---

**Stow-on-the-Wold Rural District.** DR. R. DEANE SWEETING'S Report to the Local Government Board on the sanitary circumstances and administration of the Stow-on-the-Wold Rural District represents a very unsatisfactory condition of water supply, from shallow wells, nearly all in proximity to privy vaults. Though Bourton is now provided with a sewerage system, there still remain some fifty houses which have the old objectionable privy vault. When the new sewerage system was adopted, many of these old privy vaults and many of the old rubble drains were not dug out, so that the wells of Bourton-on-the-Water are still liable to contamination by impurities soaking into the bed of porous gravel from which the water is obtained. Excrement disposal is effected for the most part in the usual village privy vault, often a mere hole in ground, covered by a wooden plank or planks, or by a stone slab. The contents, being infrequently removed, soak away into the ground, endangering neighbouring water supplies. Twelve months is the usual period which elapses between the removals of privy contents; but in some instances it was found that they had not been removed for four years. In Bourton-on-the-Water, since the establishment of a sewerage scheme, the introduction of water-closets has proceeded gradually. Of the 201 houses connected to the main sewer ninety-two are now provided with water-closets, or nearly one-half. Of these eighty are hand-flushed and twelve are provided with a two-gallon flush, pumped from the well to a cistern in the water-closet. Most of the hand-flushed closets were very foul, and some of the water-closets are badly situated, viz., inside houses and opening directly into living rooms. Dr. Sweeting adds:—"The above facts point strongly to the need of a proper public water service. The choked condition of many of the gullies, and the filthiness of most of the hand-flushed closets, the inconvenience of having no water supply to upstairs closets, all point to this urgent necessity. It is, indeed, an indispensable corollary to the system of public drainage already established in the village."

---

**Home Arts and Industries.** THE Home Arts and Industries Association annual Exhibition at the Albert Hall was opened on Thursday, for a few days only. The Association is the result of the writings of Ruskin and Morris, the object being to encourage the handicrafts in the rural districts of Great Britain, and, after fifteen years of work, the Association has done much to revive crafts that were dying out and develop existing industries, such as the hand-loom. The work is in no way professional, a great deal is done in finding and developing local talent at an early age. There is a great deal of crude and elementary work in the exhibition, the object of the Association being to make the necessities of life first well constructed and put together, and to make the more beautiful things afterwards, so that there are a great many useful and artistic things offered for sale at by no means high prices. The stalls are arranged under the name of the village or town from which the work comes. One of the most interesting is that from Compton, Surrey, the principle feature being the models for part of the Watts Chapel that has been built there from the designs of Mrs. Watts and entirely executed by the village people; the work is good of its kind and we believe is the result of wood carving classes started there some years ago. The Della Robbia Pottery Company have a class in connexion with the Association. We have rarely seen more beautiful pottery, of such modest pretensions, than that they exhibit. The best metal work is that from Yattendon, designed by Mrs. Waterhouse, mostly consisting of repoussé copper work. There are some very good double-handed tankards exhibited, and the work is good throughout. There is a great variety of metal work, but the quality of it varies It is remarkable how the same class of work coming from different counties differs. In the wood carving this is very noticeable; that coming from Penrith, Welbeck, and Altringham, all under the same teacher (Mr. Phillips), being unusually good work because of its freedom of line and great boldness of execution, arriving unconsciously sometimes at a high level of technique; whereas the Kent County Council send a great quantity of praiseworthy work, bad in inspiration and worse in design, descending to the greatest ugliness possible to modern wood-carving. The inlay work from Little Gaddesden is specially good. We fancy we have seen some by the same hands at the Arts and Crafts. Stepney and Pimlico have also good work of this class. There is a good show of bookbinding and embossed leather work.

## COMPETITION DRAWINGS FOR THE CARTWRIGHT MEMORIAL HALL, BRADFORD.

THAT this competition has evoked considerable interest in the architectural profession is clear from the fact that no less than 117 sets of drawings submitted in the competition are now exhibited in the museum of the Bradford Technical College. The problem certainly presented much attraction. An admirable site, ample funds, though not more than ample, few and simple requirements (apparently), and a monumental character, all tended to make the subject attractive.

The site is situated in the beautiful Lister Park of Bradford; the sum to be expended is 38,000*l.*; the requirements were first a suite of entertaining rooms, consisting of Mayor's parlour or drawing room, reception hall, and banqueting hall. These were also to be suitable for art galleries, and, in addition, there was required an art gallery and black and white room. The ground floor was to be mainly devoted to museum purposes and refreshment-room, and lavatory accommodation were also to be provided.

Three distinct ideas had, therefore, to be incorporated in their designs by the competitors. The building is to be first a memorial, thence it should be monumental; secondly, it is to be suitable for civic entertainments; and, thirdly, it has to serve a general and every-day purpose as museum and art gallery. It is but natural that where competitors have for the most part failed has been in the fusion of these distinct ideas. A few, but not many, have failed to give a monumental character; many have given too much prominence to the museum and crippled the festal purpose; several have omitted to make the reception-rooms suitable also for use as art galleries. The problem in fact, alluring by its apparent simplicity and capability, has led the competitors between Scylla and Charybdis, and only the practised navigators in the stormy seas of architectural competition have possessed the clear head and steady hand to steer the middle course.

The first premiated design by Messrs. J. W. Simpson and J. Milner Allen owes its position, in all probability, to the boldness with which the authors have departed from the suggestions of the programme laid down by the promoters in the original instructions, and have taken advantage of the latitude allowed, on the initiative of the assessor, in the replies to questions asked by intending competitors. Instead of arranging the reception-rooms in line on the south front, the successful competitors have grouped the whole of the first-floor galleries *en suite*, so as to form one continuous range of reception-rooms with the reception-hall and grand stairs in the centre. The reception-hall (on the first floor) is, in fact, virtually a very large balcony in the centre hall (on the ground floor) with a staircase on each side. The central hall, and reception hall partly over it, being on the north and south axial line, the banqueting hall and art gallery form respectively the east and west wings of the building, connected to the reception-hall by the drawing-room (or Mayor's parlour), and the black and white room. The central hall ends in a semicircular apse, which on the basement forms the public shelter, open to the park. The museum rooms (88 ft. by 28 ft., and 72 ft. by 28 ft.) are placed on the ground floor, under the art gallery and banqueting-hall, the remainder of the ground floor being occupied by the central hall, staircases, and approaches, and ample cloak-room accommodation. The refreshment-room is located at the south-east angle of the basement, with kitchen and offices behind it, and therefore in a convenient position for service to the banqueting-room. The details of the plan are well worked out, and as an architectural conception has purpose and fitness. In the disposition of the building on the site the authors have slightly adjusted the transverse axis line, so as to bring it into line with the statue of Sir Titus Salt. In external treatment the design is in a simple type of Renaissance, based on an order of coupled Ionic columns and pilasters. These stand upon plinths and a rusticated basement, and the blank upper walls of the elevation are not merely inoffensive but valuable parts of the design. Play of light and shade is given to the south front by a porte-cochère, with open balcony over, surmounted by a cupola, the junction of which, with its support, is the weakest part of the design. It is hardly necessary to say that the drawings are well prepared.

The second premiated design, by Mr. A. R. Jemmett, is distinctly inferior to the first, but like this has its axial line central with the principal entrance and a fine effect of vista. The reception rooms on the first floor are arranged along the south front with the Mayor's parlour in the centre and the reception room and banqueting hall right and left. At the rear, and behind the central hall, is a suite of two picture galleries, with the black and white room between. Ample museum space is provided on the ground floor, and in the basement on the north side is placed the refreshment department and shelter portico. The kitchen is not so well arranged with reference to the banqueting hall as in the first design, and is besides practically useless for the refreshment department. Although the plan outline is varied, the exterior treatment is somewhat commonplace and tame, but inoffensive, and by no means equal to the interior in effect. A somewhat false impression is conveyed in the principal or south elevation by the drawing of the main walls in lighter ink, although they set back only 2 ft. 6 in.

The third premiated design, by Messrs. W. A. Pite and R. S. Balfour, is essentially different in *motif* to the first and second designs, having the central hall with the axis east and west instead of north and south, and approached therefore from the main entrance at its side. The principal stair is at the east end of the central hall. The reception-rooms are on the south front, and not only *en suite* but unapproachable except through one another. The art galleries are on the north side of the central hall. The museum space on the ground floor is very ample; indeed, the chief merit of this plan lies in the ground floor, with its magnificent central hall and museum. The cloak-rooms are well placed on the ground floor next the entrance, though not so roomy or well-arranged as in the first premiated plan. The elevations are broad and dignified, but the main order being only one story in height, with a considerable expanse of blank wall above, is too weak for the general scale of the design.

The authors of the three premiated designs are about right in their estimates of cost, assuming the accuracy of their cubing. The first design is cubed at 8d. below the ground line, and 1s. 0½d. above; the second is cubed at 1s.; and the third at 11d.

Of the non-premiated 114 designs, a few are bad, but a very few compared with the general average of competitions, some are mediocre and several are good, though we cannot say that any one is equal to the first premiated or superior, taken all round, to the second and third. We can imagine that though the assessor had no great difficulty in selecting the best design, his labours were not easy in placing the second and third, and we do not intend to convey that the order in which we refer to subsequent designs is that which merit would necessarily justify.

The design by Mr. A. Brunnell Thomas is bold and dignified in its external treatment, though we think the keystones to the windows are a little too bold. The elevations, in pure line, are amongst the best drawn in the room. The plan somewhat resembles the third premiated, but the central hall is not so fine in effect, although communication between the rooms is better, a balcony corridor being provided. The cloak-rooms are in the wrong place and not well-arranged. Like the third premiated, this plan has a good museum provision, though even here the accommodation for public and catalogues would have to be of the makeshift order to be seen in many existing examples.

Messrs. Graham, Nicholas, and H. E. Kirby have also a dignified and well-proportioned external treatment, though somewhat of a domestic character is imparted by the mansard roofs. The general idea of the plan is magnificent but not convenient; thus, for example, the porter's room and catalogues are hidden away where no stranger would find them, and the cloak-rooms are in the wrong place. The design looks on plan extravagantly costly, though the authors make it cube out all right at 11d.

As we recently announced the dissolution of partnership between Messrs. Gibson & Russell, it is interesting to find exhibited in close proximity a design by Mr. J. S. Gibson and another by Mr. S. B. Russell, which, in their exterior treatment at least, might have been evolved by the same hand and brain, both being examples of *le dernier chic* in Renaissance as understood in England. Both designs are vigorous and bold, but, whilst we are grateful for these qualities, we should prefer less of the forced whimsicality and grotesque character pervading them. In plan the two designs are essentially different; Mr. Gibson's has the central hall on the north and south axial line, as in the first and second premiated plans, whilst Mr. Russell places his hall in a similar manner to the third premiated design. Mr. Gibson's plan has many points in common with the first premiated, but lacks the air of completeness and smoothness which this possesses. The cloak-rooms, for example, are in a good position, but are not well arranged. This is one of the very few plans in which the refreshment-room is placed on the ground floor, and not in the basement. Mr. Russell has two staircases—one at each end of his central hall—which lead to a gallery of intercommunication. His plan and, we think, also his exterior grouping are spoilt by an ornate, fantastic, unnecessary, and useless portico, which would have been a *porte cochère* but that it has steps all round. The reception-rooms are on the south front, with the Mayor's parlour at one end. The cloak-room accommodation is ample and well arranged, but not quite in the best position.

*(To be continued.)*

## THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

THE twelfth meeting of the Discussion Section of the Architectural Association was held at 56, Great Marlborough-street, W., on the 5th inst., Mr. H. J. Leaning in the chair.

In opening the proceedings, Mr. Leaning presented the Section with a reading desk after a design by Mr. Bonner Hopkins, and to defray the cost of which the Committee of the Architectural Association had some little time previously voted the money.

Mr. H. A. Satchell opened an interesting and well-sustained debate on the "Contract System —its Merits and Abuses." Favouring it rather than the "non-contract system," he maintained that some form of contract was a law of Nature, and was the best and least expensive method of building. Looking again at the subject from the three points of view, viz., that of the client, the architect, and the builder, he held that the client under the contract system had the great advantage of knowing how much money he was spending, and that more energy was displayed by the builder in proceeding when he had everything clear before him. The architect, too, was obliged to think out fully his design down to the details straight away, and thus all tendency to procrastination was avoided; while the builder, knowing exactly what was required of him, could set his whole staff to work to do his part of the contract expeditiously and well.

Mr. Robert Schultz, who spoke more at length on the "non-contract" system (in which the builder was paid so much per cent. on the prime cost for profit and establishment charges), confessed that he had come to the opinion that a "contract" was better in the interests of all parties—the client, the architect, and the builder. Perhaps, with no contract, the architect had the best of it, alterations being readily made, and at the same time there was less hurry and less responsibility; whilst, too, in the matter of seeing there was no unreasonable delay, much more depended upon the builder and his foreman. Still, without a contract, the work was undoubtedly more costly. The fact would surely leak out, and the workman would be inclined to take matters easily. The builder, too, was tempted to put on a less energetic foreman, and take less trouble in buying in the cheapest markets.

Mr. Howell Williams, L.C.C., speaking as a London builder, strongly favoured the contract system. The point raised by Mr. Satchell, on the builder setting his whole staff to work, was, he held, a true one, and was only possible when the builder knew exactly what was required of him. From the client's point of view, he thought the absence of a proper contract unfortunate, and liable to lead to much unpleasantness later on when settling up accounts. As for the architect, to have a schedule of prices (still a contract) was perhaps the best, leaving him free to design without being perpetually harassed for the "lump sum." But for the builder, within reasonableness, he thought things should be "cut and dried." Delays, daysheets, and what they knew as "messing about," caused more loss to builders than anything else. He pleaded for absolute confidence between architects and builders, the architect maintaining his professional position of impartiality and the builder feeling all security in leaving matters in the architect's hands. He added, he set his face strongly against the "open" competitive system of contracts as leading to work being undertaken by a class of builders who made their profits by scamping their work. Public bodies were more obliged than private persons to put things into "open" competition dealing with money from the rates, but the London County Council were unable, owing to this system, which he deplored, to get the leading London builders to tender. About 6 per cent. for establishment charges he held as about the average in cases, to be added to 10 per cent. or 12 per cent. for profit where work was done on "prime cost." One out of twelve was about the average of the contracts a London builder won, and he thought for each bona-fide tender a small fee should be paid to cover establishment charges.

Mr. C. H. Brodie, following, stated that he was always informed that builders who built their own houses found the cost enormous, there being no reasonable inducement to hurry the work along. Mr. Hopkins, Mr. Matt Garbutt, and Mr. Taylor continued the discussion, and the Chairman, who decried the speculative side to a contract as an inherent defect, stated he had been surprised, on inquiry, to find how much work was being carried on in London on the per cent. system on prime cost value. "Measure and value," he maintained, was perhaps the best means of obtaining sound work.

Mr. Seth-Smith, summing up, stated that a contract, being enforceable by law, with finality as to time and money, saved the extreme unpleasantness the architect was liable to under the "no contract" system, though, speaking for himself, he should like to state that his opinion of country builders was highly favourable, and though perhaps they could not be got to realise *time* at all, within six months or a year, still their work often left nothing to be desired, which was, after all, the really important thing. He, too, saw the evils of the "open" competitive system, and quite agreed with Mr. Williams that the mutual confidence between architects and builders was most desirable, and that all architects should do the best in their power to ensure as little of the speculative character in contracts as possible.

The thirteenth and last meeting of the session was announced for the 26th inst., when Mr. J. Leonard Williams is to read a paper on "Houses of the Speculative Type."

◆

## WINCHESTER CATHEDRAL NAVE ROOF.

FOR nearly three years the roofs of Winchester Cathedral have been in the hands of builders executing works of renovation and reparation that had become necessary in consequence of the defective state of the external covering, together with the general disorganisation of the timber framings.

The nave roof, to which our illustrations refer, originally of Norman construction, and subsequently altered and re-arranged by William of Wykeham (1367-1404) to form a steeper pitch in conformity with Edington's (1345-1364) gable at the west end, had become a dead weight, lying not on the walls, but on the vaulting; each beam, instead of acting merely as a tie, was carrying the timbers of the bay of the roof and was resting on the apex ridge of the vaulting; the walls in themselves taking little weight as the tie-beams had been unskilfully scarfed, in some instances at each end, and the rafter feet, instead of bearing on the wall-plates, had been cut off and were resting upon sills which were strutted off the ties.

The work that has been executed by the builders, Messrs. Thompson, of Peterborough, under the supervision of Mr. J. B. Colson, the Surveyor to the Dean and Chapter, has been carried out with a view of relieving the nave vaulting from a pressure it was never intended to bear, and which was causing a deleterious effect, as was evidenced by the extensive fissures existing in the ashlaring and by the flushings in the underside of the stone ribs at the joints; as well as with the intention of forming a complete tie at the wall-plates, the absence of which

had allowed the walls to spread and was augmenting the mischief caused to the vaulting by the pressure above.

The scarfing has been readjusted, and lifting trusses have been formed on each side of the tie-beams, whereby they have been raised and are maintained clear of the vaulting. The wall-plates have been entirely renewed, and the rafter feet and ashlars have been reinstated. Iron ties have been inserted at various levels, connecting the sills upon which the rafters are supported, and these sills, together with their struttings off the ties and the uprights from the ties to the underside of the collars, have been allowed to remain. An entirely new series of purlins and rafters, with diagonal bracings, has been constructed outside the original roof, which serves the purpose not only of bracing the whole old structure together, but forming a true and even surface upon which the battens and external covering of lead have been placed.

The vaulting (one of the earliest specimens of "Milne" vaulting, that of Ely and Gloucester being only of slightly prior date) has received the necessary attention, two bays having been centred up and the ribs and ashlarings replaced; and for the purpose of executing this a travelling bridge scaffold was erected, supported upon cantilever brackets projecting from the triforium arches, upon which tram rails were fixed, and the whole was capable of being moved with ease from end to end of the beam.

The total cost of the works has been about 12,000*l.*

## MAGAZINES AND REVIEWS.

IN the *Art Journal* the article on "The Decorations of London Clubs" deals in this number with the Naval and Military Club, formerly Cambridge House, which has the record (rare in London) of being a former celebrated private mansion converted into a club. The interiors where unaltered have therefore an interest of their own, while the exterior differs from the usual club type. The ground-floor has been entirely "clubbised" in treatment, but the first-floor is little altered, and the interior of the octagon room, which forms one of the illustrations, indicates how much character is to be found in this portion of the house. An article on "Old Masters in British Lace," by Mrs. Bruce Clarke, touches on an interesting subject and has some charming illustrations.

The Jubilee Series of reprinted articles and illustrations continues to have a great deal of historical interest, and in some respects is consoling, as showing how far the decorative arts, at all events, have advanced with us during the last fifty years.

The *Quarterly Review* contains an article on the Government of London, which sums up highly in favour of the proposed Bill in this connexion, the Bill having been brought in by the political party to which the *Quarterly* is affiliated. It is somewhat odd to see what is really so drastic a "progressive" measure brought in by a Conservative Government and supported by the leading Conservative review. The same number contains an article on Velasquez and Rembrandt, written in a fine spirit of criticism. "Both painters," says the writer, "were realists, in their absolute truth to nature; but both rose far above mere imitation. Both succeeded in adding to their work that indefinable *something* which gives the abiding charm—that mysterious gift of genius which, as Coleridge says, converts the *passing* into the *permanent.*" The sentence is a very good attempt to indicate the difference between commonplace realism and the realism of genius. Another article which will interest our readers is that on "Old Oak," a review of two or three illustrative works of ancient furniture. The writer is correct in his remark that in most of these books good drawings are accompanied by very weak and inadequate letter-press. We feel somewhat sceptical, however, as to the story of the architect who wanted to clear away all the old carved bench-ends in restoring a church. This seems to be part of the *Quarterly's* old habit of slinging abuse at architects.

The *Architectural Review* (Vol. VI., No. IV.) gives the selected and one of the premiated designs for a New York yacht club building, both of them showing the characteristic merits and equally characteristic vices of the Ecole des Beaux-Arts. The chief article in the number is occupied with the exhibition of The Architectural League of New York, with small reproductions of a good many of the designs, which are of considerable interest; occasionally, like the Reredos for Dorchester (Mass). mere imitation work; occasionally of considerable originality, though this, as in the "Storage Warehouse, New York," consists rather in the new combination of details from historical styles than in actual invention.

In the *Architectural Record* (quarterly), Mr. Beverley Robinson's interesting and clever essay on "Architectural Composition" is continued. Two of the contributors to the number are English—Mr. G. A. T. Middleton writes on "Architecture at South Kensington," and Mr. Banister Fletcher on "The Sanitation of Dwellings in England." The small City House in New York is the subject of an article by Mr. Montgomery Schyler.

The *Berliner Architektur-Welt*, a new journal, is copiously and well illustrated, but gives striking evidence of the extent to which modern decorative art in Germany has taken up the cult of ugliness. There are some clever things illustrated, but the designs for furniture at the end of the number are hideous in taste, and so are many of the bits of decorative design given.

The *Studio* (April 15) contains articles on houses by Mr. Voysey and on furniture designs by Mr. Mackmurdo—the personal articles which are the fashion of the day; an illustration of the Whitechapel Art Gallery of which Mr. Townsend is the architect, and a drawing of Mr. Walter Crane's design for the Mosaic frieze for the front, with allegorical women and British workmen treated decoratively on a flat plane. Is it possible that the time will come—perhaps not very long hence—when people will discern an unreality in this kind of thing, and wonder why it was done?

The *Artist* publishes a long illustrated article on the work of the late Mr. Wolf, the animal and bird painter, with a number of illustrations from his drawings. It is interesting to learn that the artist scarcely ever endeavoured to draw with the living animal actually before his eyes; he watched it over and over again and then sketched his impressions. "Some New English Wall-Papers" is the title of remarks accompanying illustrations of various wall-papers produced by a well-known firm; they are not all of equal merit, and some of them show too great a tendency to revert to the straggling and semi-naturalistic patterns popular a generation ago.

The *Engineering Magazine* includes among its subjects the Alexander III. Bridge at Paris (treated entirely from the engineering, not from the artistic point of view), and one on wood-working machinery; both largely illustrated with technical diagrams.

The *Nineteenth Century* includes a short article by Mrs. Lecky on "The House in the Wood" ("Huis ten Bosch"), at which the delegates to the Peace Conference are to meet. The article is partly concerned with general history, but gives some information also about a rather interesting building.

*Scribner's Magazine*, under the "Field of Art" heading, touches on "Mediæval Goldsmiths' Work at Conques," with illustrations of some very curious early examples.

The *Pall Mall Magazine* continues Mr. Dana Gibson's "Sketches in Egypt" (Part III.), and devotes a descriptive and illustrative article to St. John's, Newfoundland, under the heading "Capitals of Greater Britain."

To the *Revue Générale* M. Arnold Goffin contributes a short essay on "Les Peintres Florentins," with illustrations dealing with the early or Giottesque period.

*Morings' Quarterly* continues the article commenced in the previous number, on Greek "Terra-cotta Figurines," with illustrations.

The *Antiquary* contains an article, by Miss Vansittart, on Midmar Castle, Aberdeenshire, with a good many illustrations, and the first of a series on "Ancient Kentish Colonies in Anglo-Saxon England," by Mr. T. W. Shore.

The April number of the *Essex Review* contains an interesting article by Mr. Chancellor on St. Laurence Blackmore, with a considerable number of drawings of various points in the building.

*Knowledge* is publishing a series of articles on "Electricity as an Exact Science," by Mr. Howard B. Little, and on "The Acetylene Industry," by Mr. G. T. Holloway.

We have also received the *Gentleman's Magazine*, the *English Illustrated Magazine*, and the *Genealogical Magazine*.

## PROPOSED SUMMER VISITS OF THE ARCHITECTURAL ASSOCIATION.

THE following list of interesting mansions has been drawn up by the Summer Visits Committee for the ensuing session:—

June 3—Hatfield House. Conducted by Mr. T. W. Aldwinckle, junr., and Mr. G. A. Lansdown.

June 17.—Gatton Park, near Merstham. A very fine eighteenth century mansion. The Hon. A. McGarel Hogg and Mr. H. Rose.

July 1.—Shooters' Hill House, Pangbourne. A large house by Mr. Leonard Stokes, who will conduct the party. A large house by Mr. John Belcher may possibly also be visited. Mr. Francis Hooper and Mr. W. Hargreaves Raffles.

July 15.—Graemes Dyke, near Harrow. A large mansion by Mr. R. Norman Shaw, R.A., the residence of Mr. Gilbert, the dramatist. Mr. H. D. Wilkinson and Mr. F. Dare, Clapham.

July 29.—Lee Park, near Blackheath. An eighteenth century mansion, restored upon a very large and fine scale. Mr. F. D. Clapham and Mr. Wilkinson.

August 26. — Hever Castle (as restored). Mr. W. H. Raffles and Mr. Hooper.

## THE ARCHITECTURAL ASSOCIATION SPRING VISITS:

### BUILDING TRADES EXHIBITION.

A LARGE party of the Architectural Association visited the Building Trades Exhibition on the 6th inst. by the invitation of Mr. H. Greville Montgomery, the organiser of the Exhibition, and the members were kindly entertained to tea by that gentleman in the interval of their inspection of the Exhibition. As the exhibits have been to a large extent mentioned in this journal, it is needless to attempt to give any further account of them. The visit presumably was arranged by the Visit Committee of the Architectural Association, but no member of that committee was present, as far as could be judged, and, consequently, the visit was not so satisfactorily carried through as it might have been. It might be suggested to the organisers of future Exhibitions that a small plan, with the numbers of the stalls upon it, would greatly facilitate the work of finding any particular exhibit. The Exhibition contained so large a number of materials and manufactures that a really exhaustive examination of them would occupy a longer period than one afternoon. However, much was seen that is of the very greatest interest, and Mr. Montgomery is to be heartily congratulated on the completion of a very useful piece of work.

## THE BUILDING TRADE DISPUTE.

THE secretary of the Amalgamated Society of Carpenters and Joiners (Mr. Chandler) has replied to the letter of Mr. Hassal, the secretary of the Association of Master Builders, conveying the terms of the resolution passed at the recent meeting at Birmingham. Mr. Chandler, in the course of his reply, says:—

> Whatever may have been the differences in the past between sections of employers and our trade, or however keenly the points in dispute may have been contested on both sides, we have never presumed to ask your association for such a humiliating pronouncement as the one desired from us, although the occasions have been many and the circumstances such that we should have been glad to have had those employers with whom we had no quarrel taking sides with us. But in our wildest dreams it never crossed our minds to make such an unreasonable request, and had we done so we should never have committed the mistake of adding to it a threat in case of non-compliance.
>
> I am, however, directed to point out that if your association will consent to withdraw their sympathy and support from the master plasterers and allow them to settle the dispute with their men themselves, it would render it much easier for our executive to obtain from our members some assurance of the character desired. But to attempt anything of the kind under the present circumstances would of a certainty rouse such feelings of resentment that both sympathy and support would go forth to the operative plasterers to an extent that, under any other conditions, it would have been impossible to have secured.

On the 8th inst., on inquiry at the London offices of the Master Builders' Association, Mr. T. Costigan, the secretary, stated that no meeting had yet been fixed to deal with the replies which the various unions connected with the building trade had made to the employers' demand for assurances that they would not support in any way the National Association of Operative Plasterers. In several cases the unions affected have distinctly declined to pledge themselves in the manner laid down by the employers' federation, while the others have replied that no answer can be given until their members have had an opportunity of voting upon the matter. So far from the bricklayers, stonemasons, carpenters, slaters, plumbers, painters, and the builders' labourers' unions complying with the masters' terms, some of them, it is stated, are now taking a ballot of their members upon the advisability of levying themselves in favour of the plasterers. More than this, at a recent meeting of the London Building Trades' Council, at which representatives were present from the building trade unions, a resolution was passed in favour of at once rendering financial assistance to the locked-out plasterers.

A meeting of the Yorkshire Federation of Building Trade Employers was held at Leeds on the 5th inst., the President, Mr. John Spink, of Sheffield, presiding. Representatives were present from the following towns and districts among others: Leeds, Sheffield, Bradford, Hull, Halifax, Huddersfield, York, Scarborough, Wakefield, Barnsley, Rotherham, Spen Valley, Harrogate, Driffield, Idle, Shipley, Staincliffe, Heckmondwike, and Cleckheaton. The principal resolution, which was adopted with only two dissentients, was as follows :—

> That, in accordance with the resolution passed last Friday, we hereby order the whole of the members of this Federation to lock out 25 per cent. of their men to-morrow, May 6.

The opponents to this resolution were the Bradford delegate and the representative from Harrogate. In the first case the opposition arose solely from the fact that the Bradford builders prefer to follow the lead of the National Federation, whose President (Alderman Holdsworth) lives in that city. At Harrogate the employers are understood to be thoroughly in sympathy with the policy of the Yorkshire Federation, but have what is known as season work on hand which would render it difficult for them to at once carry out the letter of the resolution. In another week or two they will be ready to come into line with the remainder of the federated masters.

The meeting began at two o'clock, and shortly after five an adjournment was made to enable a sub-committee to draw up a statement of some of the facts which had caused the dispute. It was subsequently endorsed by the general gathering, and instructions were given to have the document printed and circulated throughout Yorkshire. The statement runs as follows :—

> IN consequence of the action taken by Operatives' Societies in ordering certain of their members to cease work because non-union labour had been employed, the Yorkshire Federation have been reluctantly compelled, in the interests of the public generally and the building trade in particular, to issue this statement in order to make known the many unfair practices and the constant acts of tyranny of trade unionists which are so rapidly undermining the principles of freedom of employment.
>
> The following are some of the practices which employers in the building trade have hitherto had forced upon them :—
>
> 1. (*a*) Compelling foremen, who represent the employer, to join the operatives' union and thus become their servant rather than the employer's.
>
> (*b*) Refusal to work until the foremen have joined the operatives' union.
>
> 2. The refusal to work along with non-union men and coercing non-union men to join their unions.
>
> 3. (*a*) By dictating to the employer which workmen shall do certain work and by not allowing the employer any voice or choice in the matter.
>
> (*b*) The practice of withdrawing all their men when such work is given to another trade.
>
> 4. By refusing to fix material worked or partially worked in any other district.
>
> 5. Limitation of apprentices.
>
> 6. The objection to submit all trade disputes to a Conciliation Board of employers and employed at a conference, with a view to arriving at an amicable settlement, and thus prevent any strike or withdrawal of workmen.
>
> (Signed) John Spink, President; Sutcliffe Hanson, Secretary.

In the evening the Leeds Branch of the Yorkshire Federation of Master Builders met at the Queen's Hotel, and unanimously adopted the following resolution :—"That this branch approve of the action of the executive of the Yorkshire Federation of Building Employers in confirming and ratifying their resolution of Friday last, in which they pledged themselves to support the Hull Association, and this Federation undertakes to use its best efforts to succeed in freeing its members from Trade-Union tyranny." The proposer was Mr. Isaac Gould, and the seconder Mr. John Wilby. About 150 employers were present.

A meeting of the Leeds bricklayers to discuss the situation was held on the 5th inst. in the Kingston Unity Hall. The proceedings were private. It is understood, however, that the men were unanimous in fighting the question out with the masters. The only difference of opinion that arose was in regard to the advisability of withdrawing the 75 per cent. on the masters locking out 25 per cent. of the men. The feeling was in favour of a waiting policy. With respect to the question of promoting a co-operative system in the building trade, to work independently of the masters, its consideration was deferred.

It is stated that the resolution of the Yorkshire Federated Master Builders came into effect on Saturday. It was calculated on Saturday that fully a thousand men would be thrown out in Leeds alone. While at Selby the lock-out came into effect on Saturday as at Leeds, at Wakefield it is to remain in abeyance until this Saturday.

## THE BUILDERS' ACCIDENT INSURANCE, LIMITED.

THE eighteenth general meeting of the Builders' Accident Insurance, Limited, was held at the registered offices, 31 and 32, Bedford-street, Strand, W.C., on the 3rd inst., Mr. Stanley G. Bird in the chair.

The Secretary, Mr. R. S. Henshaw, read the minutes of the seventeenth annual general meeting, which were confirmed. The report and accounts for the period ending December 31, 1898, were taken as read.

In moving the adoption of the report, the Chairman said that the annual meeting of the company had previously been held in the months of July or August, the accounts having been made up to the previous May 31; but it was decided last year that, in future, the accounts should run from January 1 to December 31, and the meeting take place as soon as possible after the latter date. They had, therefore, to deal with a period of seven months only—too short a time to be able to form any definite opinion on the working of the Workmen's Compensation Act; but, at any rate, long enough to satisfy them with the progress of the business so far. They would see by the report, acting under actuarial advice, the amounts unpaid on quarterly policies issued up to December 31 last had not been included, and therefore the company was actually in a stronger financial position than shown by the balance-sheet. The number of claims sent in was 1,123; of these 52 per cent. had been settled without the intervention of any court of law or arbitration; 2 per cent. had been decided by the county or higher courts, and on December 31 46 per cent. were still under consideration, the majority of which had been dealt with. Where death had unhappily resulted from the accident, 40 per cent. had been settled; 33 per cent. there were no claims for, and 27 per cent. were still in negotiation. When the company had settled the rate of premium—which resulted in a considerable reduction to that originally proposed to be charged by what were termed the tariff offices—much criticism was evoked from some of their rivals on the fact that this company being a mutual company did not possess the stability that unissued capital gave to such associations where the funds were provided by shareholders, who, in their turn, expected a dividend on money so invested. To meet this difficulty the directors took power under the policy to call upon every insurer to pay a sum up to 100 per cent. on the amount of his premium by certain specified instalments. Happily the result of the seven months that had passed since the Act came into operation had shown that there was, at any rate, at present little chance of this additional payment being required, although, from the short time that had elapsed, it was obviously too soon to forecast the future. In conclusion, he was sure they would agree with him that there was every reason to be satisfied with the result of the last seven months' working, and with their present position. The support they had received from various parts of the country, no less than their present strong financial condition, was, he thought, a subject for congratulation, and he felt confident that with the same and increased support of the trade it was founded to assist, and with equal care and caution in its management in the future as had been displayed in the past, the Builders' Accident Insurance might not only retain its present position, but, in future, attain a still higher rank among similar organisations.

Mr. James Hill said he had much pleasure in seconding the motion, and thought the report very favourable considering the short time the company had worked under the new Act, and had no doubt that the energy shown by the directors would lead to further success.

The report and accounts having been discussed, the resolution was put to the meeting and carried unanimously. The retiring directors were re-elected.

Mr. A. Stewart Harrison then proposed that the directors' fees be raised from 400*l*. to 600*l*. per annum. This was seconded by Mr. Gregory, President of the London Builders' Association, and carried unanimously.

Mr. Charles Fox, F.C.A., was re-elected auditor of the company.

Mr. Andrew Killby proposed a vote of thanks to the Chairman for his services during the past year; this having been seconded by Mr. James Hill, was carried unanimously.

The Chairman having replied, the meeting terminated.

## *ARCHITECTURAL SOCIETIES.*

PEOPLE'S PALACE ARCHITECTURAL SOCIETY.—A meeting of this Society was held on the 29th ult., Mr. Francis R. Taylor in the chair, when a paper was read by Mr. H. A. Darling on "Girder Construction." The author, in his opening remarks, said that some few years ago wrought iron was almost universally used, it being cheaper than steel. At the present time, however, the more economical methods employed in the manufacture of steel have changed this, and it is now the exception to specify wrought iron for structures, steel having taken its place. It was pointed out that rolled joists were uneconomical, especially for large spans, because of the section being uniform from end to end, and consequently no provision was made for the variation of the stresses to which the girder was subjected. This was, to some extent, remedied by the use of compound girders, but there was a great waste of material in many of the stock sections, the greatest waste occurring in the web. Plate girders were then considered, and the processes involved in the manufacture of the common types of iron and steel girders were described. On the conclusion of the paper a series of questions on practical details were asked and answered. A paper on "Portland Cement" was then read by Mr. Albert Grenville, which dealt with the manufacture, properties, and uses of the material. The paper was illustrated with lantern slides. A visit will be made to the Charterhouse to-day, May 13.

GLASGOW ARCHITECTURAL ASSOCIATION.—On the 2nd inst., in the Rooms, 187, Pitt-street, the President (Mr. Geo. S. Hill, A.R.I.B.A.) in the chair, Mr. Thomas Ramsay read a paper entitled "Some Points in the Erection of a Modern Office Block." In his introductory remarks the author said a building of this class was erected in the first place with the specific purpose of making money for its owners, with, occasionally, the further purpose of serving as an advertisement. The requirements necessary to allow of its doing so the author considered to be good situation or site, ease of access, good light, maximum of rental area, ease of rearrangement to suit tenants, and the minimum of cost consistent with true economy. The author enlarged on these several requirements, pointing out, among other things, the necessity for the introduction of a certain amount of fire-resisting, if not fireproof, material in the construction, and the absolute necessity of good light, this latter requirement, in his opinion, considerably affecting the money-earning capacity of the block.

DEVON AND EXETER ARCHITECTURAL SOCIETY.—The annual meeting of this Society was held at the Princess-square School of Art, Plymouth, on the 6th inst., under the presidency of Mr. James Crocker, F.R.I.B.A., of Exeter. The annual report was presented by the Hon. Secretary (Mr. Harbottle Reed). It stated that the list of membership had slightly increased, and now stood as follows :—Members, 45; associate members, 9; associates, 13; honorary members, 4—total, 71, as against a total of 68 in 1898. Since the annual meeting held at Exeter on May 7, 1898, there have been held six general meetings and seven meetings of the Council, when many matters of professional interest have been dealt with. The Architects' Registration Bill, and the attitude of the various societies in relation thereto, had been a source of considerable correspondence. The Council had had before them the "administration of building by-laws in rural districts"; also communications from the Birmingham Architectural Society with regard to "building by-laws and their administration," as well as the new building by-laws for Exeter. The competition for the St. Thomas's Board Schools had had consideration, as well as that for the Okehampton new Workhouse and Totnes Cottage Hospital. On September 10, 1898, an excursion was made to Launceston by invitation of the ex-President (Mr. James Hine). No other separate excursion was held, but many of the members joined in that to Oxford on June 15, 1898, organised by several Exeter societies in conjunction. It is proposed on similar lines to make an excursion to Windsor in June. Last May a selection of the Institute prize drawings was, through the courtesy of the Museum and Technical Education Committee of the Exeter City Council, exhibited in the Albert Memorial. Similar arrangements would be made for another exhibition, on May 23, of the 1899 drawings, and afterwards, for the convenience of Plymouth and Cornish members, they would be shown at Devonport. The prize offered by the Society for the best sheet of measured drawings had been awarded to the only competitor, H. E. Roskruge, of Devonport. The balance in hand amounted to 8*l.* 14s. 11d. The Plymouth, Devonport, and Stonehouse branch had been doing useful work especially in connexion with the competition for the Tavistock-road building scheme, the conditions of which were so manifestly unfair, from a professional standpoint, that representations were made to the Corporation of Plymouth with a view to their modification. The Corporation, however, would not accept the suggestions, and, in consequence, no practising architect of the Three Towns (with the exception of a junior member of the profession, who is not a member of the Society) took part in the competition, and Mr. Crickmay, F.R.I.B.A., who was asked by the Corporation to act as assessor, declined the appointment.—The retiring President (Mr. James Crocker) then delivered his address. As a citizen of Exeter he might, he said, be pardoned if, in the first place, he referred to two or three city works. In building matters he might mention four of importance—the adoption of the "model by-laws" by the City Council and the erection of the Clock Tower, the near completion of the Museum and Technical Schools, and the fine new Church of St. David. While in Exeter they had been dealing with the sewage, at Plymouth they had completed a noble scheme of water supply, and other works, either proceeding or completed, included the Keyham Docks, the Citadel and Crown Hill Barracks, the widening of Old Town-street, and the new Technical Schools at Devonport. Quite apart from these there had been great general activity in both counties. The revision and re-issue of the Royal Institute of British Architects' scale of charges after twenty-six years was a matter of some importance, even though it did not absolutely bind the Courts. After referring to the question of architectural education, he proceeded to express approval of the Architects' Registration Bill now before Parliament. At the close of his address, Mr. Crocker was accorded a vote of thanks on the motion of Mr. C. Cole. Mr. James Hine seconded the motion, which was supported by Mr. Kitsell. On the proposal of Mr. O. Ralling, seconded by Mr. H. G. Luff, Mr. C. King, of Plymouth, was elected President for the ensuing year. In occupying the chair, Mr. King explained that he only took it on the clear understanding that Mr. Luff would not accept the duties of the office and had declined in his favour. Mr. C. J. Tait was elected Vice-President, on the proposal of Mr. B. Priestley Shire, seconded by Mr. W. W. Dwelly, and Messrs. H. G. Luff, J. E. Harvey, and J. M. Pinn were elected members of the Council. In proposing the re-election of the Hon. Secretary (Mr. Harbottle Reed), Mr. Crocker said a vote of thanks was due to him. This was seconded by Mr. King and supported by Mr. Cole. A similar compliment was paid to the Hon. Treasurer, Mr. O. Ralling, and the Branch Secretary, Mr. P. B. Shires. Previous to the meeting, luncheon was taken at the "Duke of Cornwall Hotel," and during the afternoon a visit was made to the new artisan's dwellings recently erected by the Corporation. The party then drove on to the Pearse Convalescent Home.

Bristol Society of Architects.—The annual general meeting was held at the Fine Arts Academy, Clifton, on Monday, the 8th inst., Mr. W. L. Bernard, President, in the chair. The annual report and balance-sheet, which was presented and adopted, showed that the Society is increasing both in numbers and influence, and that the financial condition of the Society is satisfactory. The students' prizes were then distributed, after which a paper on "Speculative Builders and their Little Ways," was read by Mr. Frank Wills, who very humorously described the deficiencies of the class of builder which the ground rent system has called into existence.

◆

## *ARCHÆOLOGICAL SOCIETIES.*

Royal Archæological Institute. — A general meeting of this Institute was held on the 3rd inst., Sir Henry Howorth, K.C.I.E., M.P., President, in the chair. Chancellor Ferguson, F.S.A., exhibited photographs of a large door-lock in the Tullie House Museum, Carlisle. No history is known of this lock. It is 2 ft. 1 in. in length and 7 in. in breadth. It is classified, according to its construction, as a warded spring draw-back lock with three bolts. A key-hole is seen on both the front and the back of the lock; but they are not opposite to one another; in fact, the lock contains duplicate sets of works or wards, one set in advance of the other, and probably belonged to the door of a strong room.—Dr. Wickham Legg, F.S.A., read a paper on the account in English of the annointing of the first King of Prussia in 1701.—The Rev. W. G. Clark Maxwell read a paper on "The Roman Towns in the Valley of the Bœtis," being a record of six months' investigation of the Roman sites, &c., on the banks of the Guadalquivir, between Cordova and Seville. After contrasting the thickly populated condition of the country in Roman times, as evidenced by the abundant traces of their occupation, with its present scanty population and neglected appearance, he described his method of investigation, which was to walk along the river bank, noting and marking on a map those places which presented evidences, such as bricks, &c., and "tierra de villar" of Roman settlement; remains of more extensive building, perhaps representing the "latifundia" of classical times; and such large collections of fragments of amphoræ, or kilns, as to suggest the site of a potter's workshop. He then gave a more particular account of the tentative excavations carried on at Peñaflor, Peña de la Sal, and Alcolea, the modern representatives of Celti, Arva, and Canana. A certain number of new inscriptions were discovered, while others were verified. A large number of amphora handles bearing stamps were picked up; many of the stamps being the same as occur in other places, notably among the débris of which Monte Testaccio in Rome is composed. Mrs. Clark Maxwell was of opinion that these were mostly made in Bœtica, to contain the produce of that region when exported to Rome. A number of graves built of bricks and tiles were discovered, which, from their situation, orientation, and absence of objects deposited with the bodies, might be referred to the Christian period. At Alcolã del Rio the Roman walls of concrete partly remain, as well as the ruined fragments of quays and river walls, which bear evidence of the forgotten time when the Bœtis was a highway of commerce. The Rev. E. S Dewick, Mr. F. Spurrell, and Mr. Herbert Jones took part in the discussion on the above papers.

◆

The London Government Bill.—In the House of Commons on Tuesday, on Clause 6 of this Bill, which gives the Committee of the Privy Council power to make a provisional order determining which of the powers under the London Buildings Act of 1894 or any amending Act are to be exercised by the London County Council and which by the various councils. Mr. Balfour said this clause had been introduced into the Bill in order to complete what he might call the theory of the Bill so far as the transfer of powers was concerned; and it was an attempt to circumvent the difficulty of doing so by schedule. It was the best attempt that could be made, but at the same time he believed it was foredoomed to failure, and he would therefore withdraw it.

## THE LONDON COUNTY COUNCIL.

The usual weekly meeting of this Council was held on Tuesday in the County Hall, Spring Gardens, Lord Welby, Chairman, presiding.

*Loans.*—On the recommendation of the Finance Committee, it was agreed to lend the Hammersmith Vestry 4,820*l.* for electric lighting purposes; the Strand District Board 14,600*l.* for street improvements in Leicester-square and Drury-lane, and a dust destructor; and the St. George's Guardians 14,975*l.* for the provision of a workhouse laundry.

*Electrical Traction on London Tramways.*—A report was submitted by the Highways Committee, on the application of the London United Tramways Company, to be allowed to use the overhead system of electric traction on that portion of their lines which comes within the county at Hammersmith. When last the matter was before the Council, it was decided to allow the company to use the overhead system on one branch of the line on condition that they constructed another portion on an underground system. The company subsequently asked for a modification of these conditions, and in support of this request stated that it had, at the urgent request of the Vestry of Hammersmith, just completed the relaying of the Goldhawk-road tramways as a double line, which was equipped, with the exception of the electrical conductors, for working on the overhead system. Having given consideration to this request, the Committee informed the company that, having regard to the expenditure (stated to be about 20,000*l.*) recently incurred by it in repaving the Goldhawk-road, and to the serious inconvenience which would be caused to the inhabitants by the road being again disturbed for the reconstruction of the tramways, they were prepared, provided that the Company would give an undertaking to lay down, on the terms stated in Mr. Robinson's letter of September 27, an underground electrical system of traction for use on the tramways from Young's Corner, viâ King-street, to Hammersmith Broadway, to recommend the Council to modify its resolution of October 18, and to give its consent to the use of the overhead trolley system, instead of an underground system, as specified in the resolution, on the tramways from Uxbridge-road Railway Station viâ Goldhawk-road to Young's Corner, the other terms and conditions of the resolution remaining unaltered. The Committee recommended in accordance with their report.

Mr. Bull said that the Hammersmith Vestry had not been consulted in this matter, and, under the Act of Parliament, they had the right to be consulted, and, therefore, he thought it should be taken back for their consideration.

Mr. Benn, Chairman of Committee, said he would take back the Report for a week.

*Sewage Matters.*—On the recommendation of the Main Drainage Committee, it was agreed (1) that the tender of Messrs. Mills & Knight, amounting to 491*l.* 16s. 4d., for the docking and repair of the s.s. *Burns* be accepted; (2) that the offer of Messrs. Crossley Brothers, Limited, to supply and fix an air compressor, driven by a small gas-engine, in the place of the present air-exhausting apparatus, at the King's Scholars' pond sewer pumping-station, for the sum of 175*l.*, be accepted.

*Tribunal of Appeal.*—The Building Act Committee recomended, and it was agreed: (*a*) That the Council do approve of the arrangement made by the Tribunal of Appeal for the provision of office accommodation at the new premises of the Surveyors' Institution in Great George-street, at a rent of 120*l.* per annum, to include rates, taxes, lighting, and heating, the sum of 5s. per week being paid for cleaning the offices and attendance; (*b*) That the Council do suggest to the Secretary of State for the Home Department that the scale of remuneration for the members of the Tribunal of Appeal, laid down in 1895 and extended in operation until the end of last year, should be continued in operation for the year 1899.

*Competitive Designs for Dust Carts.*—The Public Health Committee reported as follows:—

"We reported to the Council on March 21 last, that in response to the Council's advertisement offering a premium of 25*l.* for the best design for a dust cart and cover, a large number of designs had been sent in, but that the further progress of the matter had been delayed owing to the lamented decease of Sir Douglas Galton, who had kindly expressed his willingness to act as arbitrator. On learning that Mr. Henry Law, M.Inst. C.E., had been appointed as Sir Douglas Galton's successor in the chair of the Council of the Sanitary Institute, we inquired whether he would be good enough to undertake the arbitration, and he has kindly promised to do so. We have accordingly advertised the fact that Mr. Law will arbitrate upon the designs, and we will report the result of the competition to the Council in due course.

*Destroying an Historic House.*—The Parks and Open Spaces Committee reported as follows:—

> "On the ground at Grace-street, Bromley, which the Council has recently acquired for the purpose of a recreation ground, is a house formerly occupied by Mr. Rutty, a contractor. From the first it has been intended to clear away the house in order that the site of it might be utilised as part of the open space. It would, however, appear that there are one or two points of some interest in the building, and it has been surveyed and included in the Council's Register of Historic Buildings. We have examined the building, and are of opinion that there is nothing in it which would warrant exceptional measures being taken in order to secure its retention, whilst, on the other hand, we are strongly of opinion that every foot of open ground which can be secured in this district as a playing space for the thousands of poor children who have at present only the streets as a playground is of far more importance than the preservation of a particular staircase or doorway. Members of the General Purposes Committee have had an opportunity of viewing the house, and we understand that they are not in favour of its retention. Moreover, the land was purchased under Section 12 of the Open Spaces Act, 1887, to be laid out as public walks or pleasure grounds. This, of course, involves the removal of all the buildings, except such as may be necessary in connexion with the management of the ground as public walks or pleasure grounds. If it should be desired to retain the house for other purposes, Parliamentary sanction would have to be obtained. Under all the circumstances, we have given directions for the house to be pulled down at once, in order that the work of laying out this place for the benefit of the people may no longer be delayed. Part of the materials of the building will be used in the laying-out works, and thus some expense will be saved. We recommend—That the course taken be approved."

Dr. Longstaff said that the Council arranged with a number of antiquarian societies to make a record of historic buildings that ought to be preserved, and on the list was this Tudor house. Now the Council proposed to demolish it.

Mr. Cooper moved that the recommendation be referred back for further consideration, and this was seconded by Mr. Wallace Bruce.

The debate was adjourned for a week.

The Council adjourned soon after 7 o'clock.

## METROPOLITAN ASYLUMS BOARD.

Sir Edwin Galsworthy presided on Saturday at the fortnightly meeting of the Managers of the Metropolitan Asylum District.

*South-Western Hospital.*—The Committee of this hospital reported that Mr. J. P. Norrington, the surveyor engaged to prepare specifications for the remaking of the roads of the institution, recommended the use of asphalte for the portions of roadway most subject to wear, as, though the initial cost would be heavier than that of macadam, the annual cost, spread over twenty-five years, would be considerably less than half. It was decided that Mr. Norrington should prepare specifications including asphalte for the roads most used, the total estimated cost of the work being 5,200*l*.

*Northern Hospital.*—An estimate of 11,832*l*. as the cost of the proposed electric light installation at the Northern Hospital was approved and adopted, and it was resolved to apply to the Local Government Board for permission to raise the money on loan.

*Grove Hospital.*—The statement of claim in the action brought by Messrs. Kirk & Randall against the Board having been delivered, the Works Committee was empowered to defend the action under the advice of the solicitors. The claim, which is for over 32,000*l*., is based chiefly on the alleged delay in delivering plans, and delivery of imperfect plans by the architect during the building of the hospital.

*Margate Homes.*—Plans for the erection of two additional homes for convalescent children at Margate, prepared by Messrs. C. & W. Henman, architects, were approved and adopted. The two houses will be in connexion with the institution known as East Cliff House, and will each contain twenty-five beds. The approximate estimate for the building work was 6,938*l*.

## APPLICATIONS UNDER THE LONDON BUILDING ACT, 1894.

At the meeting of the London County Council on Tuesday, the Building Act Committee brought up the following list of applications under the 1894 London Building Act. Those applications to which consent has been given are granted on certain conditions.*

### *Lines of Frontage.*

*Bermondsey.*—Buildings on the site of Nos. 73 to 101 (odd numbers only), inclusive, Old Kent-road, Southwark, and the widening of Leroy-street (Mr. A. Murray for the Bridge House Estates Committee). —Consent.

*Newington, West.*—Houses on the south side of New-street, Kennington, and the east side of Doddington-grove (Messrs. Briant & Son for Mr. A. F. De Laune).—Consent.

*Marylebone, East.*—A porch and balcony in front of a block of buildings on the site of Nos. 27, 29, 31, and 33, Mortimer-street, St. Marylebone (Mr. A. J. Hopkins for Mr. F. Debenham).—Consent.

*Dulwich.*—A projecting clock in front of No. 199, Maple-road, Penge (Mr. W. Forrest).—Consent.

*Hammersmith.*—One-story shops on part of the forecourts of Nos. 292, 294, 296, 298, 300, 302, 304, and 306, King-street West, Hammersmith (Mr. A. Lines for Mr. A. M. Naylor).—Consent.

*Hammersmith.*—One-story shops upon part of the forecourts of Nos. 308, 310, 312, 314, and 316, King-street West, Hammersmith (Mr. A. Lines for Mr. T. Braithwaite).—Consent.

*Bermondsey.*—A block of buildings with bay-windows on the east side of Old Kent-road, Bermondsey, adjoining Kingsley-buildings (Mr. J. Moore for the Improved Industrial Dwellings Company, Limited).—Consent.

*Clapham.*—An addition in front of St. Luke's Church, Ramsden-road, Clapham (Mr. F. W. Hunt for the Rev. Canon J. Erskine Clarke).—Consent.

*Dulwich.*—One-story shops on part of the forecourts of Nos. 64 and 66, Church-street, Camberwell (Mr. L. V. Hunt for Messrs. L. Whitehead & Co.)—Consent.

*Dulwich.*—A house upon the east side of College-road, Dulwich, to the northward of Sydenham Villa (Mr. C. H. Lawson for Mr. A. Flint).—Consent.

*Lewisham.*—Bay windows to thirteen houses on the west side and thirteen houses on the east side of Wellmeadow-road, near its junction with Brownhill-road, Hither Green, Lewisham (Messrs. Allen, Harvey, & Co. for Mr. A Cameron Corbett, M.P.). —Consent.

*Lewisham.*—Bay-windows to thirteen houses on the west side and thirteen houses on the east side of Broadfield-road, near its junction with Brownhill-road, Hither Green, Lewisham (Messrs. Allen, Harvey, & Co. for Mr. A. Cameron Corbett, M.P.). —Consent.

*Lewisham.*—Houses with shops on the site of Nos. 49, 51, 53, 55, and 57, Dartmouth-road, Forest Hill, Lewisham (Mr. W. Hart Gritten for Mr. E. C. Christmas).—Consent.

*Lewisham.*—Tile-covered pents to the entrances to ten semi-detached houses on the west side of Homecroft-road, Sydenham (Mr. F. Colwill).—Consent.

*Wandsworth.*—That the application of Messrs. Young & Hall for an extension of the periods within which the erection of a building on the west side of Rosendale-road, adjacent to the London, Chatham, and Dover Railway Company's railway bridge, Herne Hill, was required to be commenced and completed, be granted.—Agreed.

*Westminster.*—Two two-story oriel windows in front of the Queen Anne's Bounty Offices, Great Smith-street, Westminster (Messrs. H. & P. Currey). —Consent.

*Westminster.*—Buildings on the north side of Greycoat-place, Westminster (Mr. R. Blomfield for the Army and Navy Co-operative Society).—Consent.

*Whitechapel.*—An iron and glass shelter in front of the Cambridge Music-hall, Commercial-street, Whitechapel (Mr. F. Matcham for The Cambridge, Limited).—Consent.

*Lambeth, North.*—A swing sign-board in front of No. 228, Westminster Bridge-road, Lambeth (Mr. S. Blow for the Midland Railway Company).—Refused.

*Marylebone, West.*†—Buildings on the east side of Abbey-road and west side of Grove End-road, St. John's Wood, on the Neville Lodge Estate (Messrs. Boehmer & Gibbs for Mr. H. Lovatt).—Refused.

*Hampstead.*—A house on the eastern side of Heathurst-road, Hampstead (Mr. J. H. Hudson for Mr. W. A. Hudson).—Refused.

*Islington, North.*—A lavatory and water-closet addition at the "St. John's Tavern," Junction-road, Islington, to abut upon St. John's Park (Mr. J. Taft for Mr. D. Bushill).—Refused.

*Islington, North.*—A theatre building on the north side of Rock-street, Finsbury Park, Islington, at the corner of St. Thomas's-road (Messrs. Murray & Foster for the Theatre Sites, Limited).—Refused.

*Kensington, South.*†—The rebuilding of part of No. 12, Sumner-place, to an advanced line in Old Brompton-road (Mr. W. H. Collbran).—Refused.

*Lewisham.*—A wood and iron verandah in front of ten houses on the east side of Ivy-lane, Brockley (Messrs. Tompkins & Barker).—Refused.

*Marylebone, West.*—A two-story oriel window in front of the 5th West Middlesex Rifle Volunteers' Drill-hall and headquarters, Nos. 21 to 31, Homer-street, St. Marylebone (Captain J. H. Smith).—Refused.

*Wandsworth.*—Two projecting illuminated signs at the "White Lion" public-house, High-street, Putney (Mr. W. Hancock for Mr. T. J. Scrutton).—Refused.

*Woolwich.*—A one-story shop upon part of the forecourt of No. 2, Francis-street, Plumstead (Mr J. Wolf).—Refused.

### *Width of Way.*

*Bethnal Green, South-west.*—A play-shed at the infants' school on the south side of Newport-street, Bethnal Green, at the corner of Coventry-street (Rev. A. R. Clemens).—Consent.

*City of London.*—The rebuilding of No. 116, Fore-street, Cripplegate, with a projecting oriel window (Messrs. N. S. Joseph, Son, & Smithem, for the trustees of the Cripplegate Bank).—Consent.

*City of London.*—Two angle turrets to a proposed building on the site of Vulcan Wharf, on the south side of Upper Thames-street, City, adjoining Puddle Dock (Mr. C. Reilly).—Consent.

*Islington, South.*†—Buildings on the west side of Pleasant-place, Essex-road, Islington (Mr. R. Nevill). —Consent.

*Bethnal Green, North-east.*—A two-story addition in front of the schools on the east side of Cranbrook-road, Green-street, Bethnal Green (Mr. T. J. Bailey for the School Board for London).—Consent.

*Rotherhithe.*—That the Council do make no order with reference to the application of Messrs. Newman & Newman on behalf of the proprietors of Hay's Wharf, Limited, for permission to retain iron gates erected across Hay's-lane and Counter-street, Tooley-street, Rotherhithe.—Agreed.

*Lewisham.*†—Seven houses with shops on the north side of Wells-road, Sydenham (Mr. H. T. Adams).—Refused.

*Westminster.*—A building on the north side of Orchard-street, Westminster, at the corner of Great Smith-street (Mr. G. A. Hall for the Mutual Tontine Westminster Chambers Association).—Refused.

### *Space at Rear.*

*Marylebone, West.*—The rebuilding of No. 8, Northumberland-street, St. Marylebone, at the corner of Paddington-street, to abut at the rear upon a disused burial-ground in Paddington-street (Mr. Beresford Pite for Messrs. Matthews Brothers). —Consent.

*Clapham.*—The uniting of No. 40, Blandfield-street, Nightingale-lane, Clapham, with a one-story building, No. 40A, Blandfield-street (Mr. L. S. Rogers for Mr. J. Down).—Consent.

*Wandsworth.*—Six houses on the north side of Oakhill-road, and five houses on the west side of Elizabeth-place, East Putney, with an open space at the rear (Mr. W. Goodwin).—Consent.

*Southwark, West.*—A modification of the provisions of Section 41 (1) (vi.) of the London Building Act, 1894, with regard to open spaces about buildings, so far as relates to the proposed erection of two dwelling houses with shops on the ground floor on the site of Nos. 2 and 4, Webber-row, Southwark, and the site of No. 72, Webber-street, respectively, with irregular spaces at the rear (Messrs. F. S. Brereton & Son, for the trustees of Marshall's Charity).—Consent.

*Fulham.*—A modification of the provisions of Section 41 of the London Building Act, 1894, with regard to open spaces about buildings, so far as relates to the proposed erection of a two-story house with a shop on the ground-floor on the east side of Grimstone-road, Fulham, at the rear of No. 132, Hurlingham-road, without an open space at the rear (Mr. H. G. Gardner for Mr. F. W. Freure).—Refused.

*St. George, Hanover-square.*—A modification of the provisions of Part V. of the London Building Act, 1894, with regard to open spaces about buildings, so far as relates to the proposed erection of a block of residential flats on the site of No. 25, Hanover-square, St. George, Hanover-square, at the corner of George-street, with an open space at the rear (Mr. C. Bell for Mr. G. A. Schafield).—Refused.

### *Line of Fronts and Width of Way.*

*Bermondsey.*—An addition to the porch to the Charterhouse Mission, Crosby-row, Bermondsey (Mr. B. Ingelow for the Committee of the Charterhouse Mission).—Consent.

### *Width of Way and Space at Rear.*

*Walworth.*—Twelve dwelling-houses, to be inhabited by persons of the working class, on the south side of Nursery-row, Walworth (Mr. R. J. Dickins for Lord Llangattock).—Refused.

*Bethnal Green, North-east.*—Certain deviations from the plans certified by the District Surveyor, under the provision of the London Building Act, 1894, so far as relates to the proposed rebuilding of the "Prince Albert" beer-house, No. 61, Old Ford-road, Bethnal Green, to abut upon Russia-lane (Mr. B. J. Capell for Messrs. Truman, Hanbury, Buxton, & Co., Limited).—Refused.

---

* Names of applicants are given in brackets. Buildings are new erections unless otherwise stated.

### *Line of Fronts and Construction of Buildings.*

*Rotherhithe.* — Three iron gangways across Morgan's-lane, Tooley-street, Rotherhithe, to connect the second, third, and fourth floors respectively of warehouses on each side of the lane (Mr. A. Webb for Messrs. Boord & Son).—Consent.

*Islington, North.*—An iron room on the flat roof of the addition at the rear of No. 51, Highgate-hill, Islington, abutting on Salisbury-road (Mr. F. S. Hammond for Mr. H. Lay).—Refused.

*Paddington, North.*†—A wood and glass cycle-shed on the forecourt of No. 45, Maida-vale, Paddington, at the corner of Clifton-road (Mr. S. Barrett for Mrs. E. Cooper).—Refused.

### *Formation of Streets.*

*Lewisham.*—That an order be issued to Mr. S. Cawston, sanctioning the formation or laying out of eight new streets for carriage traffic on the Bromley Park Estate, London-road, Lewisham. That the names Ashgrove-road, Calmont-road, Farnborough-road, Coniston-road, Hillbrow-road, Elstree-hill, Madeira-avenue, and Warren-road, be approved for the new streets.—Agreed.

*Lewisham.*—That an order be issued to Mr. H. Roberts, sanctioning the formation or laying out of two new streets for carriage traffic, to lead out of Laleham-road and Brownhill-road, Catford (for Mr. R. Howell, Mr. H. Hawkes, and the Earl of Dartmouth). That the names Carswell-street and Redfern-street be approved for the new streets.—Agreed.

*Wandsworth.*—That an order be issued to Mr. L. S. Rogers, sanctioning the formation or laying out of a new street for carriage traffic, to lead from the Grove to Allfarthing-lane, Wandsworth, and the widening in connexion therewith of a portion of Allfarthing-lane. That the name Pentland-street be approved for the new street.—Agreed.

### *Cubical Extent and Construction of Buildings.*

*Greenwich.*—That the application by Mr. G. S. Young for the Thames Iron Works and Shipbuilding Company, Limited, and John Penn & Sons, Limited, for the Council's approval of the plans and particulars submitted for the construction of an iron workshop in a yard at the Greenwich Engine Works, John Penn-street, Blackheath-road, Greenwich, be granted.—Agreed.

*Fulham.*†—The erection at Wandsworth Bridge-wharf, on the east side of Wandsworth Bridge-road, Fulham, of an open iron shed to exceed in extent 250,000, but not 450,000 cubic feet, and to be used only for the purposes of the trade of a timber merchant (Mr. E. Avern for Mr. E. H. Johnson).—Refused.

### *Height of Buildings.*

*City of London.*—A building on the south side of Tallis-street, Victoria Embankment, City, between the premises of the *Daily Mail* and the National Telephone Company, to the height shown upon the plans submitted with the application of Mr. H. O. Ellis for Messrs. Harmsworth Brothers.—Agreed.

*Whitechapel.*—A theatre building on the south side of Whitechapel-road, Whitechapel, with the east wall exceeding in height the width of Tasmania-place (Mr. F. Matcham for Mr. W. M. Tilson).—Consent.

*Westminster.*—A building on the north side of Greycoat-place, Westminster, with a portion to exceed 80 ft. in height (Mr. R. Blomfield for the Army and Navy Co-operative Society)—Refused.

### *Dwelling-houses on Low-lying Land.*

*Greenwich.* — That the solicitor do prepare a licence, under Section 122 of the London Building Act, 1894, to Mr. T. Dinwiddy, for the erection of three buildings to be used wholly or in part as dwelling-houses on low-lying land situated at the corner of Trafalgar-road and Whitworth-street, Greenwich.—Agreed.

*The recommendations marked † are contrary to the views of the Local Authorities.*

## *COMPETITION.*

BOARD SCHOOL, WATFORD.—In a limited competition for a school in two departments to accommodate 1,040 children, to be erected by the Watford School Board on a site having frontages to Judge-street and Ridge-street, Mr. W. H. Syme was appointed architect on the recommendation of the assessor, Mr. E. R. Robson.

SOLDIERS' HOME, NEWCASTLE-ON-TYNE.—Lord Roberts opened the new Soldiers' Home at Spital Tongues, Newcastle, on Thursday last week. The building, which has been erected at a cost of about 2,700*l.*, is situate in Hunter's-road. It comprises a hall suitable for meetings, concerts, &c., together with reading and smoke rooms, refreshment buffet, living and bedroom accommodation for married and single soldiers on furlough or changing stations, and rooms for the superintendent and his wife. The architect for the home was Mr. J. Walton Taylor, and the contractor Mr. John Jackson, both of Newcastle.

## Illustrations.

### NEW STATES HALL, GUERNSEY.

THIS building is partly a House of Parliament and partly Law Courts. The site is extremely irregular in shape, and as regards levels there is a fall of 28 ft. from the north-east to the south-west corners. Advantage has been taken of this to place the offices for the Solicitor-General, Attorney-General, and Receiver-General on the ground floor of the south front facing Court Row. The office of the Greffier is on the same floor, and adjoining is the Record Office, a vaulted room 68 ft. long by 30 ft. wide. The principal business entrance is in the centre of the south front on this lower ground floor, and the various offices beforementioned are approached by a corridor 12 ft. wide and 130 ft. long.

The upper ground floor is approached from St. James-street, the entrance hall being 106 ft. long by 28 ft. in width. This is called the Salle d'Attente. On the south front are the halls of deliberation and election, respectively 56 ft. and 72 ft. in length by 35 ft. in width. Rooms for the deputies with cloak-rooms and lavatories are provided. The two courts are upon the opposite side of the entrance hall, from which they may be entered, but the public entrance to the police-court is from New-street, and that to the New Court or Salle d'Audience is from St. James-street. The business room for the bailiff and the juratts' retiring room adjoin the courts, and have a separate entrance from St. James-street. Above them is a library. There is a direct underground communication between the prison and the courts. The estimated cost is 50,000*l.* The materials for the outer walls are the local grey granite, Portland stone being used for the upper stages of the tower, and for the inner part of the large windows. The use of granite has necessitated great simplicity in design which is probably an advantage.

The drawing is exhibited in the Royal Academy.

### THREE BRIDGES.

AMONG the architectural drawings at the Royal Academy this year are three bridges by Messrs. Ernest George & Yeates, and of these we give reproductions in our present number.

One of these is now erecting at North Mymms, Herts, for Mr. Walter Burns. It is schemed together with an octagonal lodge, iron entrance gates, and stone piers. It is of brick and stone, and the span of each of the four arches is about 20 ft. It crosses a hollow which is the bed of the Colne, and is only occasionally flooded, though, at such times, the water rises ten or fifteen feet. Mr. J. Simpson is the contractor, having previously done the work of the house under the same architects.

The bridge at Monk Fryston, Yorkshire, for Mr. Hemsworth, is a roofed wooden bridge, for which the ancient bridge at Lucerne is taken as a type. Its length is about 80 ft. It crosses a piece of water in the park, giving pleasant shade till the opposite trees are reached.

It is constructed as an honest piece of carpentry, with its timbers halved or tenoned, and oak pinned; not relying upon nails, screws, or iron straps to keep it together.

A third example, also by Messrs. Ernest George & Yeates, is a foot-bridge crossing a right-of-way through a park. It starts from a hillside, and the descending steps (which are apt to be awkward and slippery in wet weather) are formed in an octagonal turret, shingle covered.

### ST. PETER'S CHURCH, BENTLEY, DONCASTER.

THIS church was built two or three years ago. It accommodates 400 adults. The plan comprises a wide nave with very narrow aisles, nave and aisles under one roof; a chancel of dignified proportions, with vestries, and organ chamber on the north side.

The entrances are in the western bay of the nave, north and south. A low, broad porch of slight projection shelters the northern entrance. The lowest stage of the tower forms a commodious entrance on the south side; this tower, together with the west end, forms the most prominent feature of the design, and is surmounted by a spire rising to a height of about 120 ft.

The church is built of brick, faced externally with a local stone of a warm yellow colour. The walls are plastered inside. The roofs are of Baltic timber, with massive tie beams, arched trusses, purlins, wall braces, &c., and a bold coved cornice. The roofs are covered with tiles. The floors are laid with wood blocks, with tiled passage-ways. The open benches in the nave and also the choir stalls, which are elaborately carved, are of teak. The pulpit and font are of stone. A dossal for the present supplies the place of a reredos. The east window—which is a richly traceried one of five lights—is filled with painted glass by Messrs. Clayton & Bell.

The architect is Mr. J. Codd.

### COMPETITION DESIGN FOR CHURCH FOR EXETER.

THIS was one of the many designs sent in for a rather famous competition in which the assessor was allowed only to consider a small number of the designs, previously selected without his concurrence.

The design, by Mr. G. H. Shackle, is one of considerable originality. The walls were intended to be of brickwork plastered inside, the dressings of stone, and the roof covering of Delabole slate. The church would accommodate 650, and its cost was estimated by an Exeter firm of builders at 6,500*l.*

The drawing was exhibited at the Royal Academy of 1897.

### PALAZZO BERNARDO.

THE Palazzo Bernardo has a typical Venetian elevation. The windows are treated with white veined marble, and the spandrils filled with disks of purple porphyry.

The whole front is now bereft of the gorgeous covering of frescoes by Giovanni Salviati, which formerly adorned it, but it still presents a pleasant aspect of agreeable colour, due to the variety and weatherstaining of the brickwork. The courtyard of the palace is no less attractive than the outside. R. S. BALFOUR.

## LONDON AND MIDDLESEX ARCHÆOLOGICAL SOCIETY.

AN evening meeting of this Society was held on Tuesday, the 2nd inst., at the London Institution, Finsbury-circus, E.C.

Mr. E. W. Brabrook presided, and introduced, after a few opening remarks, Sir Benjamin Stone, who was announced to deliver a lecture on "Historical Photography, especially with Reference to London and its Environs," but after he had been speaking for about three-quarters of an hour, it was discovered that the lantern, by the aid of which the photographic slides were to have been shown, had not arrived. The lecturer, however, gave a narrative of facts which he had unearthed in his researches among the relics contained in the Pyx Chapel at Westminster, Abbey, and spoke of the importance of photography in historical records, and the great use to which "snap shots" could be put, if dated and carefully preserved.

Dr. Freshfield, the President of the Society, in moving a vote of thanks to Sir B. Stone, said he wished to take this opportunity of alluding to the contemplated wholesale destruction of the old City churches. Some of the bishops, after spending a few years in the diocese, seemed to think that the best way of getting money was to pull down and sell the City churches. The Union of Benefices Act, by means of which that destruction had been carried on, had already proceeded far enough in his opinion, for at the present time the sites of three churches, viz., St. Bartholomew, Moor-lane; St. Michael, Bassishaw; and St. George, Botolph-lane, had been sold, and the churches were to be pulled down. Many of them had seen the announcement in the *City Press* that the Bishop had now organised a tribunal who were to advise him on the further demolition of the old City churches. That was a much more dangerous manner of attacking these old buildings, and through its agency he had strong reason to believe that the churches of Saint Mary Woolnoth, and Saint Edmund the King and Martyr, Allhallows, Lombard-street, and Saint Peter, Cornhill, would shortly be placed under the ban of extinction. It was to the vicars, churchwardens, and vestries they must look to help them in opposing that destruction, and he hoped those present would do their best to assist him in so doing. It was arranged that Sir B. Stone would complete his lecture on another evening, when the lantern would be forthcoming.

MEMORIAL WINDOW, ANNAHILT CHURCH, CO. DOWN.—A stained-glass window has been placed on the south side of this church. The window consists of two lights and was designed and executed by Mr. T. F. Curtis (Ward & Hughes), of London.

# Books.

*Spon's Architects' and Builders' Price Book: With Useful Memoranda and Tables.* By W. YOUNG, Architect. Twenty-sixth edition. London: E. and F. N. Spon, Limited, 125, Strand.

THE main title of this book does not convey its real character, the "Useful Memoranda and Tables" comprising nearly half the volume. Interesting as some of these may be, they savour rather too much of the prevailing "tit-bits" order; a large number of the examples given, to be of any real value, requiring a much larger space than can be given in a book of this kind. On the other hand, some of the tables and articles are extremely useful and are not to be found collected in any other work.

This edition is almost a literal reprint of the last, even to the preface, and does not bear the impress of such careful revision as the nature of the work demands. For instance, in the table on page 167, the prices for labour and mortar on brickwork, the *highest* price given is 5*l*., in the price of brickwork on page 171 it is given at 6*l*. 15s. for the lowest. Again, we think it a somewhat dangerous example to give brickwork "picked for outside work and jointed," and "in walls picked stocks and jointed both sides" at per rod superficial, and certainly the difference in price is more than 25s. per rod between ordinary brickwork, and that "in picked stocks jointed both sides," even if the walls are thick, and this latter element enters very largely into the calculation of price.

In the prices for Portland and Bath stones on page 185 no mention is made as to the particular beds referred to. Certainly some note should be given as to these if the information is to be of any real value, as, in addition to the variation in the cost of the stone, there is a considerable difference in the cost of working. This is not the only book of its class that fails in this respect. The same remark applies to the items of Yorkshire stone on pages 186 and 187, and these, in connexion with those on page 188, require some explanation. There are a great many stones mentioned which are not likely to be in general use, and the space occupied by these might be more usefully employed in amplifying the information of those more in use; and why Robin Hood and Howley Park stone are relegated to a position amongst sundries at the fag end of the book passes our comprehension. If it is necessary to give the prices of Scotch stones, certainly the English terms should be given alongside the Scotch ones, as a price-book suited to London, or even England generally, is practically useless in Scotland.

The same want of careful revision mentioned earlier militates against the usefulness of this work, even where the information given is useful, *e.g.*, pages 293, 293*, 293†, and 294. This system of numbering should not occur in more than one edition, and the question arises which are the casements "above" mentioned on page 294? The items immediately preceding are steel and the others have the items of fixed lights immediately following.

The work generally has all the material to make it one of the most useful of its class, and with careful revision and rearrangement, with the elimination of a good many items and the amplification of others, this end would be achieved; but the simple tacking on of later information without any attempt at bringing that which the book already contains up to date, is useless. That is the impression that a careful study gives us of the edition now before us, and we think the examples given, which are only a few of those we noticed, fully bear this out.

---

*Modern Drainage Inspection and Sanitary Surveys.* By GERARD J. G. JENSEN, M.S.E., F.I.S.E. London: The Sanitary Publishing Company. 1899.

THIS little book of 126 pages can be recommended to the architect, surveyor, and sanitary inspector as a guide-book in reference to the matters of which it professes to treat. The four methods of testing drains are discussed, namely, "olfactory" tests, and testing by smoke, water, and compressed air, preference being given to the last. The "Jensen" pneumatic drain-testing machine is described and illustrated, as also are the principal kinds of smoke-machines. The author's gas-pipe testing machine is simple and useful. It consists of a pump and container; after the gas has been turned off at the meter, the tube of the machine is connected with one of the gas-fittings, and a small quantity of liquid ammonia is poured into the container, the fumes from which are then pumped into the system of pipes. A test-paper passed along the course of the pipes will locate the position of any leakage which may occur. In the matter of traps and sanitary fittings there is nothing very novel; indeed, siphonic closets and lavatories are not mentioned, nor is any mention made of the different kinds of covers for manholes and lampholes, or of channels leading to gullies. More might with advantage have been said of the methods of ventilating systems of drainage. These are merely sins of omission; sins of commission we have not discovered. The three forms of "Sanitary Report" will be of great service to the young inspector. The book is well arranged and well written, clearly printed, and profusely illustrated, and contains a good index.

---

*Journal of the Sanitary Institute.* Vol. XX., Part I., April, 1899. London: E. Stanford.

THIS number of the Journal is largely made up of what we may call the remnants of the Birmingham Congress. No fewer than twenty-two papers read (or taken as read) at the Congress are included, but of some of them the merest abstract is given. Dr. Sykes's paper on "Dwelling Accommodation in Large Cities" occupies the first place, and contains much interesting matter. The importance of the housing problem is evident when we remember that, at the time of the last census, 45 per cent. of the population of England and Wales dwelt in houses or tenements containing from one to four rooms only. In the crowded district of St. Luke's, London, the percentage was no less than 80. Dr. Sykes pleads strongly for a statutory definition of overcrowding, and insists that, for adults, the minimum air-space should be fixed at 400 cubic feet per head. Mr. Peter Addie treats of improvement schemes under the Housing of the Working Classes Act, and gives plans of the houses erected by the Corporation of Birmingham. The smaller tenements are flats, each containing a living-room, scullery, and one or two bedrooms; the buildings are of two stories, the upper tenements being reached by staircases common to several of them. The larger houses consist of two stories and an attic, and are well arranged with the exception of the stairs, which are as bad as they can well be, being indeed positively dangerous on account of the number of turnsteps or winders and the absence of light. Mr. J. S. Pickering contributes an interesting paper on by-laws relating to new streets and buildings, and draws attention to the illegal provisions contained in many by-laws, such as those relating to the height of rooms in places where the Public Health Acts Amendment Act, 1890, has not been adopted. He wisely suggests that the adoption of by-laws by Sanitary Authorities should be made compulsory, but that greater latitude should be given to authorities to frame by-laws adapted to their own particular locality. The paper was printed in our issue for October 1, 1898. There is a mournful interest in the contribution by Sir Douglas Galton, as this number of the Journal contains also the account of his death, together with a memorial notice of his career.

---

*Inwood's Tables of Interest and Mortality for the Purchasing of Estates and Valuation of Properties.* Twenty-fifth edition. Revised and Extended by WILLIAM SCHOOLING, F.R.A.S. London: Crosby Lockwood & Sons. 1899.

WHEN a book has reached a twenty-fifth edition the reviewer has merely to record the fact. "Inwood's Tables" are so well known that it would be absurd to discuss them. It is sufficient to say that those who need a book for the purpose of such calculations as the value of reversions, estates, and so forth, will find in this book the most ample assistance.

◆

## TRADE CATALOGUE.

MESSRS. HOLDEN & BROOKE, LIMITED, of West Gorton, Manchester, send us their new catalogue of steam-users' specialties, among which we notice some novelties which will prove of interest to builders. Several injectors of different kinds are illustrated and priced, but particular attention should be drawn to the exhaust steam injector for working against high boiler-pressures. This consists of an exhaust-steam injector supplemented by a small live-steam injector, the result being, it is said, a feed of very high temperature, namely, from 235 deg. to 270 deg. Fahr. We notice also their "silent heaters, boilers, and circulators," for heating and circulating liquids by exhaust or live steam; these will be useful in swimming baths, laundries, breweries, &c. The "Sirius" pulsating pump appears to be both strong and cheap; the list price for a pump to deliver 6,000 gallons per hour is only 19*l*. Russell's patent ejection valve for ejecting condensed water from steam pipes is a simple contrivance, and as it is made for pressures below 15 lb. it can be used for steam warming apparatus.

◆

## BOOKS RECEIVED.

A HISTORY OF FRENCH ART 1100—1899. By Rose G. Kingsley. (Longmans, Green, & Co.)

PRACTICAL MASONRY. By W. R. Purchase. (Crosby Lockwood & Son.)

*To the Editor of* THE BUILDER.

## SPECIFICATIONS.

SIR,—I have read with much pleasure the report of Mr. Macey's paper on specifications.

It is evident these are not left to the office boy, as they were in my younger days, but I fear the opposite extreme is being reached, and the specification is becoming an incomplete bill of quantities.

It must be remembered that drawings and specification are for the purpose of enabling the building to be erected in a proper manner.

What really takes place on a building is that the under foreman takes the builder's copy of the drawings on the work, and the specification is seldom consulted.

Builders, when consulted, say, give full particulars on the drawings, and they can dispense with specifications.

I have a number of drawings made by architects in the latter part of the last century, where a full description of the work is written on the drawing.

I cannot agree with Mr. Lovegrove that 9 in. by 9 in. is large enough for all flues. All flues over 20 ft. in length, and all kitchen flues should be 14 in. by 9 in. I have fifty-four buildings under my charge, and the 9 in. by 9 in. flues require sweeping every three months or they smoke badly.

ROBERT PHILLIPS.

*Shire Hall, Gloucester.*

## ARCHITECTURE AT THE ROYAL ACADEMY.

SIR,—Will you permit me to state that I am indebted to Messrs. Fabbrucci & McCrossan for the excellent little model of the proposed Victoria Tower for Colchester? By an accident, I much regret this was not stated in the R.A. catalogue.

JOHN BELCHER.

---

## MESSRS. GIBSON & RUSSELL.

SIR,—The statement which appeared in your last issue under the heading of "Miscellaneous," relative to the dissolution of partnership between Mr. Gibson and myself, is inaccurate, as Messrs. Gibson & Russell have never been at 4, Gray's Inn-square, but always at No. 11, where I shall continue to practise, Mr. Gibson having removed, judging from your paragraph, to No. 4. S. B. RUSSELL.

⁂ The statement sent to us previously was not quite clear.—ED.

◆

NEW HOMŒOPATHIC HOSPITAL, BROMLEY.—The foundation-stone has just been laid of Bromley Hospital and Dispensary, on the White Hart Field. The whole of the working part of the hospital is on one floor, and it will comprise, when completed, a women's ward with six beds, men's ward with two beds, children's ward with six or eight beds, two single bed wards, an operating-room, day-room, and matron's sitting-room, a complete kitchen department, linen stores, &c. Each ward will have separate bathrooms and sanitary conveniences. The out-patient's department will contain a waiting-room, consulting-room, two examination-rooms, and dispensary. On the first floor, over the administration department, are bedrooms for the matron, nurses, and servants. The whole of the building will be heated by hot water. Mr. S. B. Russell, of Bromley, is the architect; and the work is being carried out by Mr. T. D. Graty, builder, of Bromley.

## ARCHITECTURAL HYGIENE.

### XVIII.—HEATING.

THIS subject may be conveniently dealt with under the following headings :—

1. *General remarks.*
2. *Open grates.*
3. *Close stoves.*
4. *Hot-water apparatus.*
5. *Steam-pipes.*
6. *Hot air.*
7. *Electricity.*
8. *Hot-water supply.*
9. *Safety Valves, &c.*

### I. GENERAL REMARKS.

It must be clearly understood that all heating arrangements must be subservient to the scheme of ventilation, and these most important arrangements should be considered together in the designing of any building. Heat may be considered of two kinds, viz., *radiant* and *convexed*, the former is that which is conveyed in straight lines from a heated surface and its intensity (like light) decreases as the square of the distance. *Convexed* heat may be made clear by the following example :—When the air around heated surfaces becomes warmed, the surrounding and colder air forces it upwards ; this is constantly repeated till the whole of the air is warmed.

### 2. OPEN GRATES.

For a small room this is undoubtedly the most cheerful and pleasant method. Modern stoves of the *Pridgin Teale* model are a vast improvement upon the old-fashioned kinds in which nearly all the heat was sent up the flue, only about one-sixth being sent into the room. By looking at figs. 216, 217, and 218, it will be seen that the sides and back being of firebrick, and the latter being well inclined forward, the intensity of the heat is much increased, and it is thrown more into the room than in the other grates. The movable ashpan regulates the draught, so that more perfect combustion can be obtained and the removal of the ashes is facilitated. In addition to the above the "throat" of the flue should be contracted and the front and bottom bars should be narrow. In this same figure it will be noticed that a supply of fresh *warmed* air can be obtained by means of an inlet flue which is warmed by the fire. There are very many patent grates now in the market involving the above principles in various modified forms. It is well to remember, however, the danger of more complicated systems, and it is, as a rule, a mistake to depart materially from Teale's ideas as before expressed.

Fig. 219 shows Dr. Lee's patent fire regulator, and is a very simple and scientific appliance. It will be seen from the section that practically it is a blower fitted with a damper. It has been found that 30 to 50 per cent. of fuel can be saved by its use. When the fire is first lighted the regulator can be pulled up by the ratchet, and when it is well alight the regulator can be arranged horizontally over the fire so as to control the draught and combustion. It can be fitted practically to any grate, and when the fire is not in use it can be detached and stored away. It has undergone scientific tests with most satisfactory results. By its means a considerable diminution of draught occurs up the chimney, thus preventing a room from being draughty. In consequence of this diminution the heating capacity of a fire is conserved, and sent into the room instead of being drawn up the chimney. It also appears that the regulator acts to a certain extent as a smoke consumer.

A recent contrivance in fire-bricks is shown in fig. 246. They are known as the *Flaming Kitchener Cheek*, and the advantages claimed are (*a*) a continuous flow of flame ; (*b*) more heat from less coal ; (*c*) most of the smoke is consumed by the flaming brick ; (*d*) flues require less sweeping ; (*e*) ovens and boilers are more readily heated, and it burns economically any quality of coal. They are made of the best Stourbridge fire-clay, and are of the same size as the ordinary cheek, but perforated through the face with upwardly slanting holes, which ash cannot stop up while the fire is kept well raked. These front holes lead into central passages having an exit at the top, and through which the flames are drawn from the hottest parts of the fire. These fire-brick cheeks become intensely and uniformly heated right through, which prevents them from cracking and scaling off, like the solid brick cheeks which suffer from irregular expansion caused by heat playing on one side only.

When fresh fuel is added, the new flames and gases have not to wait until they can force their way through the smoking tarry mass, because they find an easier passage through this red-hot patent brick, even being drawn through the glowing embers, if previously heaped against the brick, and thus completing their combustion The balance of the smoke and gases, which may not have been drawn through the coals, fire and flaming cheek, passes over the top holes, and is there ignited by the intensely hot flames issuing therefrom. The results are—little or no smoke or soot passing into the flues, and more heat generated from less coal. The lower parts and fire-side of the oven and boiler are rapidly heated through the thin back of the cheek.

Another patent recently placed on the market is shown in fig. 247*, which represents what is known as the "Domestic Crater."

It is designed on the principle of creating an induced current of heated air to pass freely into the body of the fire, and thereby inducing more perfect combustion. It acts on the same principle as that involved in inserting a poker at the bottom of a fire to revive it. The principle is that the fuel is held up by the poker for a short time, and forms a hollow space inside the fire, allowing a free current of air to enter and pass into the fire. As the fire burns up the fuel settles down around the poker, and fills the hollow space, thus doing away with the air current. This difficulty is claimed to be remedied by the *crater*.

*Gas* is now used to some extent for grates, and especially in bed and other rooms which are not used continuously. If, however, the products of combustion are not carried off by a flue, they are unhealthy. Balls of asbestos and pumice are usually placed over a Bunsen burner, and, being rendered incandescent, produce considerable heat. Some of the later designs are modelled with the idea of providing a supply of heated air. It is probable that in the future *gas* kitcheners will be used more extensively for cooking purposes owing to their handiness and cleanliness.

### 3. CLOSE STOVES.

There are many forms now in use ; the one shown in fig. 220 and made by Shorland, of Manchester, is, perhaps, one of the best. They are economical but are liable to over dry the air and cause discomfort ; they have the advantage of radiating heat all round, but they seem apt to char the organic matter in the air and cause carbonic oxide to be generated ; the latter being injurious to health.

Fig. 230 represents the "Salamandre" stove supplied by the London Warming and Ventilation Company. It presents a cheerful appearance owing to the doors being fitted with mica panels, and the dampers are so arranged that when the stove is burning slowly the expense for fuel is reduced to a minimum, while by altering the regulator the heat may in five minutes be increased to its full capacity. It will burn continuously through a whole winter with *anthracite* at a cost not exceeding 3d. for every twenty-four hours. It can be placed in front of any grate or, if the latter be removed, it can be fixed in position with a perforated ventilating front.

---

* For figs. 237, 246, and 247, see next sheet of illustrations.

The *fuel* used in all kinds of stores has been considered by most people up to the present time simply from the standpoint of cost. There is no doubt, also, that the claims of *anthracite* have, to a large extent, been hidden from the public owing to the large interests of British capitalists in the smoky and unsatisfactory coal of everyday life. *Anthracite* is a natural coal which gives off no smoke, and it is sent out from the mines in various regulated sizes. Some fifty million tons are annually mined in the United States, and some two millions in South Wales, and some inferior qualities are found in other countries. The Americans export but little of their anthracite, but that from Wales appears to be freely sent to other countries. The British public may some day be sufficiently wise to retain in their own country the fuel which is the most economical, odourless, and smokeless that is known to mankind. The defenders of the filthy coal that fills our cities with dirt and soot, and veils our buildings in fogs and chokes our lungs with foreign matter, have stated that anthracite will not burn in open grates and should not be used for cooking purposes. As a fact, it burns better in open grates, though perhaps requiring a little more wood in the kindling, and when once alight it requires but little attention if the ash is occasionally removed from the front bars and from the base of the grate. The cinders should be riddled and reburnt. For cooking, anthracite is an ideal fuel, and for grilling purposes indispensable.

### 4. HOT WATER APPARATUS.

Under this heading we have to consider two distinct systems, commonly called
(*a*) *Low Pressure*, and
(*b*) *High Pressure*.

In both systems the circulation is due to the difference in weight of two columns of water connected together and in one continuous circuit. When one column is heated it expands, becomes lighter, and is forced upward by the heavier column pressing against its base.

(*a*) *The Low Pressure* system has many advantages over other forms of heating, the principal ones being that there is little risk of accident by fire, an even temperature is easily maintained, almost any kind of fuel can be used, and it is economical in its consumption thereof. Large pipes are used in this system, being generally 3 in. or 4 in. in diameter. Fig. 221 shows the application of this system. The flow-pipe should rise direct from the boiler to the highest level of the circulation, and the vertical fall of the return pipe should be designed as much as possible so as to be at the end of the circulation, in order to use the highest vertical column obtainable of the coldest water in the apparatus as the motive power. Dips as dotted at A and B tend to reverse the circulation owing to the column of water that is further from the boiler being cooler and heavier than that which is nearer. The nearer, however, that the dips are kept to the end of the circulation the less is their resistance. Escapes for air and steam are essential, and small pipes should be carried up well above the highest water level and should discharge into the open air. Boilers must be used that are suitable for the work required to be done. Hood's law on this subject is that one superficial foot of direct heating surface will heat 50·0 of 4 in. pipes. It is found best in practice to add at least 25 per cent. of heating surface, owing to the liability of improperly swept flues and indifferent stoking. The ordinary saddle boiler as in fig. 222, is much used and is easy to manage. Chambered boilers, as in fig. 223, have a greater heating surface and are suitable for a larger system. Cornish and duplicate boilers are used in big schemes for schools and public buildings.

*Fire Bars* should, of course, have their areas in proportion to the rest of the apparatus, and are not generally less than twenty square inches for every hundred feet superficial of radiating surface.

*Chimneys* should be well swept occasionally, and should be carried up a sufficient height so as to ensure a proper draught. They should not be less than 9 square inches in area for every hundred feet of radiating surface.

*Pipes* are generally of cast-iron in 9-ft. lengths, or in 6-ft. lengths if under 3 in. in diameter. They should be provided with sliding expansion joints to prevent their becoming inefficient owing to leaks. The other joints should be properly caulked with lead and spun yarn. Hood gives the following table to find the feet run of pipe required for every 1,000 cubic feet of space in different classes of buildings; but if the space is thoroughly ventilated 25 to 50 per cent. must be added.

| Nature of Buildings. | Temperature Required. | Length of Pipe. | | |
|---|---|---|---|---|
| | | 4 in. | 3 in. | 2 in. |
| | deg. | ft. | ft. | ft. |
| Churches and large public buildings | 55 | 5 | 7 | 10 |
| Dwelling rooms | 65 | 12 | 16 | 24 |
| ,, ,, | 70 | 14 | 19 | 28 |
| Halls, shops, waiting-rooms, &c. | 55 | 10 | 14 | 20 |
| ,, ,, ,, ,, | 60 | 12 | 16 | 24 |
| Workrooms, manufactories, &c. | 50 to 55 | 6 | 8 | 12 |
| ,, ,, ,, ,, | 60 | 8 | 11 | 16 |
| Schools and lecture rooms | 55 to 58 | 6 to 7 | 8 to 9 | 12 to 14 |
| Drying-rooms for linen, &c. | 120* | 150 to 180 | 200 to 240 | 300 to 360 |
| ,, ,, curing bacon, drying paper, &c. | 70 | 20 | 28 | 40 |
| Greenhouses and conservatories | 55† | 35 | 47 | 70 |
| Graperies and stove-houses | 65 to 70 † | 45 | 60 | 90 |
| Pineries, hothouses, cucumber-pits | 80 | 55 | 74 | 110 |

* This is the temperature when empty; when filled with wet linen, about 80 deg. † In coldest weather.

*Pipes* should be painted to prevent oxidation, and should be fitted with valves so arranged that any part of the system may be shut off at will from the flow and return. The *screw-down* valve should be used in preference to the *throttle*.

*Cisterns*, which may be worked by a ball valve, should be fixed above the highest water-level to supply the loss of water due to evaporation, &c. A waste-pipe should be provided to act as an overflow in case of the ball-cock getting out of order, and to take off the superfluous water if the system is overheated.

*Coils and Radiators* are usually placed in suitable positions for the purpose of obtaining a larger amount of heating surface. A simple form of double coil is shown in fig. 224, and a more modern form in fig. 237. Radiators were originally introduced by the Americans, but are now much used in this country. They are superior to and much cleaner than cased coils, and are now much improved in design. Fig. 225 represents one that is frequently used.

*Gratings* over pipes are to be avoided, though they are very generally in use for churches and chapels, the pipes underneath soon become covered with a layer of dust, which not only gives forth offensive smells, but also acts as a non-conductive covering.

(*b*) *High Pressure Systems* consist of a continuous circuit of wrought-iron welded tubing, generally about ⅞ in. diameter. About one-tenth the total length of piping is formed into a coil and is placed in a fire-brick lined furnace, in which the temperature can be raised to about 380 deg. F. Fig. 226 is a sketch representing the principles of this system. An expansion pipe is shown at the top of the flow-pipe, and the water not being filled into this pipe; a space is provided for its expansion. The whole apparatus being sealed, the water is heated and cooled very rapidly, and it is maintained that it is more economical than other systems for buildings and rooms that are not frequently used. The pipes have to be carefully made and tested, and are cut with male and female threads and screwed to each other by sockets, as shown in fig. 227. A syphon, as shown at A in fig. 226, is placed near the boiler to prevent the water working back up the return pipe. A disagreeable smell is sometimes noticed from this system, owing to the high temperature, from the same reason as mentioned when discussing *Close Stoves*.

## *OBITUARY.*

MR. A. P. BREVITT.—The death took place on the 2nd inst. of Mr. Archibald Paul Brevitt, architect, of Wolverhampton. The deceased, who was 59 years of age, had been in ill-health for a considerable period. He commenced practice at his native place, Darlaston, removing about fifteen years ago to Wolverhampton.

MR. W. C. TYNIE.—The death of Mr. William Campbell Tynie, took place recently, after a short illness, at his residence 2, Claremont Park, Gateshead. About thirteen years ago Mr. Tynie began business as builder and contractor in partnership with Mr. J. Graham. A few years ago the latter gentleman left England, and since then Mr. Tynie had carried on the business himself.

## *GENERAL BUILDING NEWS.*

CHURCH, LOWESTOFT.—The new mission church, which has been erected on Beaconsfield-road, Kirkley, Lowestoft, was dedicated recently. The building, which is in connexion with Kirkley Church, is to be known as "St. Matthew's Church." The edifice is of half-timber construction on a brick base, is in the Perpendicular style, and was designed by Messrs. Bottle & Olley, of Great Yarmouth, Mr. Elsey being the builder. Sub-contracts were carried out by Messrs. Brady & Todd, Mr. Whitehead being responsible for the stonework, and Messrs. Waller & Smith for the gas, &c. The nave is 70 ft. by 35 ft. 6 in., and provides seating accommodation for 500 on chairs. At the west end is a baptistry. The main entrance is at the south-west corner of the nave. The chancel is 27 ft. by 17 ft. 6 in., and has aisles and a clearstory on either side. The north aisle is used as an organ chamber and the south as a vestry. The rood screen is surmounted by a crucifix which has semi-lifesize saintly figures in adoration on each side.

METHODIST CHURCH, PUDSEY.—Trinity United Methodist Free Church, Pudsey, was opened on the 1st inst. The new buildings consist of a church with vestries and other accessories. The extreme internal dimensions of the church are 79 ft. by 53 ft. The central feature of the front elevation is an open portico, with Corinthian columns, surmounted by a pediment. The portico is flanked right and left with staircase turrets—the one on the left hand rising to a height of about 90 ft., and finishing with a cupola. The main entrance doors, three in number, are placed on the inner wall of the portico, communicating with inner vestibules. The church has galleries both at the ends and sides. The whole of the pews are open, those on the ground floor being circular on plan, radiating towards the rostrum. The windows are glazed with cathedral-tinted glass in lead, executed by Messrs. Seward & Co., of Lancaster. The ground floor of the church and vestries is laid with pitch pine wood-block flooring. The church will provide seating accommodation for about 880 adults, or a mixed congregation of some 1,050 persons. The heating is by hot water, low-pressure, fitted up by Messrs. Seward & Co., of Preston. In connexion with the heating arrangement a number of ventilating radiators have been fixed, allowing for the introduction of fresh warm air into the building. The total cost will be about 7,000*l*. Mr. W. Hutton, of Fulneck, has been the contractor for the bricklayer and mason's work; Messrs. Appleyard Bros., of Bramley, for the carpenter and joiner's work; Messrs. Laycock & Sons, Stanningley, for the plastering; Mr. F. Thompson, Stanningley, for the slating; and Mr. A. Higginbotham, of Idle, for the plumbing and painting. The architect is Mr. W. H. Dinsley, of Chorley, whose design was accepted in competition. Mr. W. Shackleton has acted as clerk of works.

CATHOLIC SCHOOL-CHURCH, ACCRINGTON.—The memorial stone of a new Catholic school-church, which is being erected on the block of land abutting on Cobham, Garfield, and Beaconsfield-streets, Accrington, was laid recently. The new building is 91 ft. long by 41 ft. in width. It is an oblong structure and will be two stories in height. The ground floor will from the outset be used as a school, and will accommodate 334 children. The upper room will serve the purposes of a chapel until a church can be built, and it will thereafter be utilised for school purposes. It is also intended to erect a presbytery. The schools will ultimately afford accommodation for 669 scholars. It will, at least until the upper room is available, be a mixed school, with class-rooms for babies, infants, and elder scholars. The architect is Mr. Hill, of Manchester, and the builder, Mr. H. Ramsbottom, of Accrington.

The cost of the building, together with that of the land, is estimated at 4,770*l*.

New Chapel at Islington Cemetery.—A Nonconformist chapel has just been opened at Islington Cemetery. In February, 1898, a competition took place, with the result that the design of Messrs. Forsyth & Maule, London, was selected, the tender price being 3,054*l*. Messrs. Gough & Co., contractors, Hendon, have carried out the work, and the superintendent, Mr. Stubbs, acted as clerk of the works.

Tower, Fenton Parish Church, Staffordshire.—On the 4th inst. were dedicated the tower and bells which have been added to Fenton Parish Church. The tower was erected by Mr. W. Mould, from the designs of Messrs. Lynam, Beckett, & Lynam. The bells are by Messrs. Carr, of Smethwick.

School, Hessle, Yorkshire.—An addition to the parish schools at Hessle has just been opened. The new building, which will consist of a schoolroom, 73 ft. 6 in. by 21 ft. 6 in., a class-room 22 ft. 6 in. by 21 ft. 6 in., and a cloak-room and lavatory, will be used as a boy's school, the old building being now occupied by the girls. Messrs. Bilson, Botterill, & Bilson were the architects, and the cost has been about 2,200*l*.

School, Heath Town, Staffordshire.—A new infants' school has just been opened at Heath Town. The schools have been erected in the Woden-road. The whole of the accommodation is provided on the ground floor, and consists of an infants' department and a department for boys and girls, containing school and class rooms, cookery-room, babies'-room, teachers'-rooms, and store-rooms. The schools, as now erected, give accommodation for 404 children. The external walls are built with local bricks, relieved with Ruabon brick quoins and terra-cotta, and the roofs are covered with Broseley brindled tiles. The various rooms are warmed by open fireplaces, fitted with Manchester grates. The general contract has been entrusted to Mr. F. W. Beard, Heath Town. The terra-cotta was supplied by Messrs. Davies Brothers, Wrexham; iron fencing by Messrs. W. Hayward & Sons; the gas fittings, &c., by Mr. A. J. Hartill; the whole having been carried out under the supervision of Mr. F. Hunter Lynes, architect, Wolverhampton, whose design was selected in competition.

Truant School, Dinas Powis, Glamorganshire.—A new truant school has been erected at Dinas Powis. The site covers an area of 8 acres, and is enclosed by a boundary wall 8 ft. high, the main entrance opening on to the White Cross-road. The buildings are quadrangular in plan. Running the whole length of the building from west to east is a corridor, with the main hall in the centre, and other corridors branching east and west respectively. On the ground floor is accommodation for various offices, committee-room, surgeon, waiting-room for boys' parents, boys' hall and staircase, boys' dining-room with kitchens adjoining, school and class-rooms, large cloak-room and lavatory with sixty basins, plunge bath, reception room with disinfector, workshop, boiler-house, and laundry. Suites of apartments are in the west and east blocks respectively for the superintendent and officers, and six large pantries and stores. On the first floor are three dormitories for the boys, bedrooms for officers and servants, bath-rooms, &c. Isolated from the main buildings, and in the north-west corner of them, is a small infirmary, the first floor of which will be used for special cases. A portion of the playground has been roofed in for use as a drill-shed. The main floors are fireproof. The floors are laid with wood blocks and tiles throughout, except in the officers' private rooms. The buildings are heated, and all the cooking will be done by steam, for which purpose two six-horse power boilers are provided. Accommodation is provided for 120 boys, but the arrangement of the buildings allows of extension if necessary. In many of the rooms the walls, to a height of 4 ft. 6 in., are faced with white glazed brick, and glazed brick dadoes run through the corridors. Externally the walls are faced with Cwmbran pressed red bricks in Flemish bond, and the roofs are covered with best Portmadoc slates laid on boarding and felting. Mr. Alexander was the clerk of works. The buildings have been erected from plans prepared by Mr. W. H. Dashwood Caple, architect, Cardiff, who has superintended the erection of the buildings, the contractors being Messrs. E. R. Evans & Bros., of Cardiff. The cost of the buildings, boundary walls, roads and lodge will be about 14,400*l*.

Board School, Perth.—Additions and alterations have been made at the Southern District Board School, Perth, at a cost of nearly 5,000*l*. A wing, two stories in height, has been added at right angles to the old school, and contains a central hall on both floors, an infants' department for 250 pupils, two senior class-rooms, a cookery-room, and a workshop. Teachers' retiring-rooms have been provided, also new lavatory and cloak-room accommodation for infants. The various works have been carried out by the following contractors:—Masonry, William Tait; joinery, William Dow & Son; plumbing, James MacLeish; plastering, J. Alexander M'Ritchie, Dundee; slating, James Buchan; wrought-irom railings, D. Macgregor. Mr. G. P. K. Young, Perth, was the architect.

Co-operative Stores, Blyth, Northumberland.—The block of new store premises erected at Cowpen Quay by the Blyth Central Industrial and Provident Co-operative Society was opened recently. Mr. A. A. Windle, of Blyth, was the architect. The contract price of the builders, Messrs. Barron & Temple, of Blyth, was 3,150*l*

Masonic Hall, Loanhead, N.B.—The foundation-stone of the new Masonic Hall, Loanhead, was laid recently. The new hall is being erected in Clerk-street, from plans by Mr. R. M. Cameron, architect, Edinburgh, and will cost about 800*l*. When completed, the main building will accommodate between three and four hundred people, while committee-rooms, &c., will be provided in the front portion.

Town-hall, Conway.—On the 1st inst. the new Town-hall was opened. The building was erected from the plans of Mr. T. B. Farrington, C.E., Borough Surveyor, but owing to the illness of Mr. Farrington, the supervision of the work was given to Mr. R. Davies, architect, Bangor, the contractors being Messrs. Thorp & Sons, Llandudno.

Co-operative Premises, Newbiggin, Morpeth.—A new public hall and co-operative store premises were opened recently at Newbiggin. The new premises, situated in the main street, have been erected by the Newbiggin District Co-operative Society, and consist of grocery and hardware shops on the ground floor with warehouses behind, while on the upper floor is a public hall to seat over 700 persons, fitted with stage or platform, retiring rooms with lavatories, committee-rooms, and offices, built with dressed ashlar stone. The architect for the new building was Mr. T. E. Davidson, Newcastle and South Shields; contractor, Mr. T. Dodds, Bedlington; heating and plumbing, Mr. J. J. Spoor, Bishop Auckland; clerk of works, Mr. Edward Reed.

Additions to Town Hall, Kensington.—On the 4th inst. additions to Kensington Town Hall were opened. On the ground floor, which may be approached either from the main building, or from Church-wall or Church-court, provision is made for the whole of the Surveyors' department. The offices vacated by the transfer will be divided between the Vestry Clerk, the Accountant, and probably the Lighting Engineer. There is also an extension of the Medical Officer's department into the ground floor of the new building. Accommodation is provided for the chief official himself, his clerks, and sanitary inspectors; whilst four extra rooms and several vaults are placed at his disposal in the basement. Vestrymen are not to have a new Council Chamber, but a room is set apart for their convenience. Upstairs, too, the members are provided with a committee-room 41 ft. by 22 ft. The usual offices are attached. The new coroner's court, on the first floor, is quite distinct from the remainder of the building, and can be reached by a separate entrance from Church-wall. The dimensions of the court itself are 32 ft. by 24 ft. There is a retiring-room at the back of the daïs on which the coroner will be seated, and a waiting-room for the witnesses is also provided. The extensions and alterations have been carried out by Messrs. Leslie & Co., builders, of Kensington-square, from plans prepared by the joint architects, Mr. W. Weaver, Surveyor to the Vestry, and Mr. W. G. Hunt, of Kensington. The cost of the site was 6,728*l*., and the contract price for the building was 13,747*l*.

Co-operative Premises, York.—New central premises of the York Equitable Industrial Society, erected in Railway-street and Tanner-row, were opened on the 3rd inst. At a depth of 9 ft. below the surface the workmen unearthed a double row of circular bases, 9 ft. 2 in. apart from each other, and fourteen in number. The new establishment has a frontage of about 150 ft. to Railway-street, and 84 ft. to Tanner-row, and is divided into eight departments. The rear of the place is entirely occupied by warehouses, to which access is gained through a gateway about 12 ft. wide, communicating with a loading yard covered by a glass roof. Two stone staircases lead to the offices and board-room on the first floor. On the second floor are workrooms, caretaker's apartments and tea rooms for the employees, together with a large assembly hall, measuring 65 ft. by 34 ft., having a gallery at one end, and platform and retiring rooms at the other. The building is lighted throughout by electricity. The buildings are heated throughout by hot water on the low pressure system. The architects are Messrs. Athron & Beck, of Doncaster, and the contractors Messrs. Arnold & Son, of the same town.

Free Library, Sutton-in-Ashfield.—A free library was opened on the 3rd inst. at Sutton-in-Ashfield as a memorial of the Queen's long reign. Mr. J. P. Adlington, architect, Sutton-in-Ashfield, designed the building, and the contract was secured by Mr. H. Shaw, also of Sutton. The one-story erection is of brick with stone facings, and is situated in Forest-street. The entrance-hall is 26 ft. long by 9 ft. 6 in. wide. There are three rooms provided, each 14 ft. high. The reading-room, which is at the rear of the premises, is the largest, measuring 34 ft. 6 in. by 25 ft. 6 in.

Lecture Hall, M'Quiston Memorial Church, Belfast.—A new lecture hall in connexion with this church has just been opened. The building comprises a central hall, capable of seating 400 persons, and five smaller rooms, embracing a committee-room with sitting accommodation for 100 persons, a large class-room, ladies' parlour, minister's study, and a kitchen. The hall is 90 ft. long by 62 ft. broad. The erection of the building was carried out by Mr. William Dowling, from the plans of Mr. W. J. Roome, architect.

Artisans' Dwellings, Southampton.—On the south side of ancient Simnel-street, Southampton, a number of slum habitations have been demolished, and on the site there is to be erected by the Corporation dwellings for artisans at a cost of about 9,000*l*. The foundation-stone of the new buildings, which are to the north of the municipal lodging-house, now in course of erection, was laid by the Mayor recently. Mr. C. J. Hair is the architect, and Messrs. Dyer & Sons are the contractors.

Proposed New Theatre, Keighley.—It is proposed to erect a new and enlarged playhouse on the site of the Queen's Theatre, Keighley. The plans of the new edifice, which have been prepared by Mr. Frank Matcham, of London, have been passed by the West Riding County Council and the Keighley Town Council.

Free Library, Putney.—On the 6th inst. a new Free Library was opened at Putney in Disraeli-road. The lending library is 42 ft. by 30 ft., the newspaper reading-room 52 ft. 6 in. by 30 ft.; and there are also a magazine-room, a ladies'-room, and a map-room. On the ground floor in the front of the building is a committee-room, and the upper apartments will be occupied by the librarian. The library, which is 80 ft. back from the road, is approached by a corridor, with an arched ceiling. The plans for the building were prepared by Mr. F. G. Smith, and it has been built by Messrs. H. Roffey, of Putney.

Hospital, Dumbarton.—On the 3rd inst. Lord Overtoun opened in Dumbarton the new "Dr. Little Hospital," which contains seven beds, and is situated in the town-end part of the burgh. When completed, it will have cost upwards of 1,000*l*. The architect is Mr. Rogerson, of Messrs. M'Whannel & Rogerson.

Clock Tower, Wainfleet, Lincolnshire.—A clock tower, which has been erected as a memorial to the late Mr. Walter Martin, was opened on the 2nd inst. The tower is of red brick, with courses of moulded blue bricks, and is 33 ft. high. The clock, supplied by Messrs. Smith & Co., of Derby, has three dials, each 3 ft. in diameter. The contractors were Messrs. J. T. Turner & Sons, of Wainfleet, Mr. J. B. Corby, of Stamford, being the architect.

Council Offices and Fire Station, Bristol.—Colonel A. G. Durnford, R.E., held an inquiry on behalf of the Local Government Board, at the Council House, Bristol, on the 3rd inst., into the applications of the Bristol Corporation for leave to borrow 7,125*l*. for the new Council chamber and offices, and 3,250*l*. for the fire station at St. George. Mr. Yabbicom, City Engineer, explained that the new Council chamber would be 60 ft. by 34 ft., and 21 ft. high. He also explained the plans for the fire station, which he said would be a plain brick and Bath stone building.

Proposed Theatre for Saltley, Birmingham.—Plans will be submitted in a few days for the erection of a new theatre at the corner of Saltley-road and Nechells-place. The designs have been prepared by Mr. T. Guest, of Birmingham. The proposed building will cost upwards of 10,000*l*., and is to seat about 2,000 persons.

Mission Hall, Hessle, Yorkshire.—A mission hall at Springville, in connexion with the parish church at Hessle, was opened recently. The building is of red brick with stone dressings, and consists of nave, chancel, and vestry. It accommodates about 120 persons, and was erected under the supervision of Mr. Thropp, the County Surveyor of Lincolnshire.

Convalescent Home, Herne Bay.—The building, standing on the top of the rising ground to the south-east of Herne Bay, at Beltinge, has just been opened. The Home is a three-storied building of brick, relieved by Bath stone dressings, &c., and has been erected by Messrs. Wall & Co., of London, from designs by Mr. A. Saxon Snell, London. It is warmed throughout by hot-water pipes, and will be lighted by an installation of acetylene gas, erected by the Acetylite Company.

Central Fire-Engine Station, Aberdeen.—These buildings, which are throughout lighted by electricity and heated by steam, are now almost entirely finished. The site, which measures about two acres, lies between the east side of King-street and the Corporation Workshops, and is bounded on the north by a branch railway to the harbour. The main buildings have a frontage to King-street of 100 ft., 70 ft. for the fire-engine station proper and 30 ft. for house (of four stories and attics) for fire-master and assistant fire-master, and two-roomed office. The fire-engine station has an elevation of white granite, and the height from the street level to the apex of the central pediment is 60 ft. On the ground floor is a room (51 ft. 8 in. long by 35 ft. wide and 17 ft. 6 in. high) for fire-engines and hose-reels, &c. At the back are doors, opening by patent spring, entering into a stable. The "duty-room," which communicates both with the engine-room and the firemaster's office, contains switchboards for the electric light, fire bells, telephone communication, and speaking-tubes. Behind the duty-room is a hanging stone staircase, lined with enamelled bricks, leading to the top of the building, the second floor of which contains houses for married firemen, while on the first floor are quarters for single firemen. On the ground floor are boil-house for horses' food and washing-place with entrances to south courtyard (on same level) and the stable. In an underground chamber is the heating apparatus. At the north-east angle is a square tower of stone, 100 ft. high, the interior of which will be used for drying hose-pipes, while iron ladder and balconies outside are intended for brigade exercise. The south courtyard, which will serve for drilling purposes, and has an access to King-street, is surrounded by plainer buildings—store, coach-house, lavatory, three-story houses for married firemen, and rooms for the Corporation's Weights and Measures Department, the latter entering from another courtyard, to the north of which are buildings for the Town Council's Lighting Department. The architect (after competition) is Mr. A. H. L. McKinnon, Aberdeen, and Mr. Robert Milne has acted as clerk of works for the Municipal Corporation. The contractors were:—Mason work, A. Cheyne; joiner, Geo. Jamieson; plaster, Jas. Stewart; plumber, A. B. Robertson; painter, A. Copland; slaters, Adam & Co.; ironwork, John Grant; electric light and bells, Shirras, Laing, & Co., Limited; heating engineer, Walter Simpson—all of Aberdeen. An illustration of the front building appeared in the Aberdeen number of the *Builder* in May last year, and the total cost of the buildings, irrespective of site, will be about 12,000*l.*

ASSURANCE OFFICES, PERTH.—A block of buildings for the General Accident Assurance Corporation, Limited, is in course of erection on the site of the old post-office, Perth. The principal elevations will be built of yellow freestone from Woodburn Quarry, Cumberland, the doorways to be of polished granite. The building will be lighted by electricity. The architect is Mr. G. P. K. Young, of Perth, and the contractors are as follows: masonry, Messrs. R. Brand & Sons; joinery, Messrs. James Hay & Sons; plumbing, Mr. James MacLeish; plastering, Mr. Alexander M'Ritchie, Dundee; slating, Mr. James Buchan, Perth; glazing work, Messrs. G. R. Douglas & Son; ironwork, Messrs. Mather & Son, Edinburgh; marble work, Mr. J. L. Thomson; bells and telephones, Messrs. Westwood & Son, Perth. Mr. George Henderson is clerk of works.

DRILL HALL, HUDDERSFIELD.—The memorial stone of the new drill hall for Huddersfield has just been laid by Lord Roberts. The whole of the buildings cover a space of ground 208 ft. 8 in. in length and 82 ft. in width. The general plan is divided into three sections. In the centre is the main hall, 108 ft. by 78 ft., with a height to the ceiling of 40 ft. At each end are balconies stretched across the whole width of the hall. On the west side of the main hall is the front block of buildings, two stories in height, which abuts on St. Paul's-street. The entrance facing the end of Page-street is 12 ft. wide, and out of the vestibule, into which this admits the visitor, open passages at right angles to the right and left. On the right of the entrance is a room for officers, and on the left the orderly room and rooms for the colonel and adjutant arranged *en suite.* The principal room on the floor above, 50 ft. by 24 ft., is utilised as a clothing store, whilst there are also provided a room for sectional meetings, examinations, &c., an ambulance store, and a room for the signallers. The two-story building at the east end of the drill hall will be practically devoted to the rank and file. There is an entrance hall from an intended street on the north side of the building. From this there is an entrance to the recruits' drill hall, which is 75 ft. long by 30 ft. wide, and to the main drill hall, and between the two there is an arms-room (with entrances and exits from each) providing accommodation for 500 stands of arms, a Maxim gun, and a cleaning-room. A staircase ascends from the ground floor to an open landing from which are entrances to the sergeants' and privates' clubs, the band-room, and the balcony at the end of the main hall. In the basement there is storage room for camp equipage, &c., and a kitchen. Captain W. Cooper is the architect.

## *SANITARY AND ENGINEERING NEWS.*

DRAINAGE SCHEME, ST. MARYCHURCH, DEVON.—Colonel A. J. Hepper, on behalf of the Local Government Board, conducted at the St. Marychurch Town Hall on the 27th ult. an inquiry into the application of the St. Marychurch District Council for permission to borrow 7,700*l.* for works of sewerage. Mr. Worth, Civil Engineer, of Plymouth, described the plans. Mr. T. W. Windeatt opposed the scheme on behalf of the Torquay Town Council, on the ground that if carried out some of the Torquay sewers would be overcharged.

SEWERAGE SCHEME, DARFIELD, YORKS.—On the 3rd inst. Mr. E. A. Sandford Fawcett, Local Government Board inspector, held an inquiry at Darfield into an application by the Urban District Council for sanction to borrow 7,000*l.* for a scheme of sewerage and sewage treatment under the septic tank system. Mr. F. Graham Fairbank, the engineer for the scheme, explained its nature and details.

WATER SUPPLY, KINGSKERSWELL, DEVON.—It is proposed to supply the village of Kingskerswell with water from the Torquay supply, and on the 28th ult. Colonel Hepper, a Local Government Board Inspector, inquired into the application of the Newton Abbot Rural District Council for sanction to borrow 2,000*l.* to carry out the scheme. Mr. Segar, the Engineer to the Council, explained the details of the scheme.

WATERWORKS, CARNARVON.—An inquiry was held recently by Mr. W. O. E. Meade-King, Local Government Board Inspector, into the application of the Carnarvon Town Council for power to borrow 3,310*l.* for the purpose of constructing a reservoir and laying down mains. Mr. R. L. Jones, the Borough Surveyor, explained the plans.

## *STAINED GLASS AND DECORATION.*

MEMORIAL WINDOW AT LICHFIELD CATHEDRAL.—A memorial window in the south aisle of the choir of Lichfield Cathedral, to the late Ven. Melville Horne Scott, Archdeacon of Stafford and Canon Residentiary, was dedicated on the 5th inst. The artist was Mr. C. E. Kempe.

MEMORIAL WINDOW, CLAYDON CHURCH, SUFFOLK.—A memorial window, executed by Mr. A. L. Moore, of London, has just been dedicated in this church. The window consists of three lights, representing three scenes from the life of Christ.

## *FOREIGN.*

FRANCE.—A statue to Lamartine is to be inaugurated at Belley on the 22nd inst.——Surveys are being made for a new railway from Dijon to Lausanne, branching off from the existing line at Frasne, passing near the lake of St. Point, and tunnelling through Mount Dor.——The second exhibition of the "Société des Amis des Arts" of the Oise Department will be held at Beauvais, from June 1 to July 1. That of the similar society of Seine-et-Oise will open at Versailles on July 2.——The Hôtel de Perfecture at Limoges is shortly to be rebuilt.——There is talk of forming an electric railway at Paris running north and south, and connecting Saint Denis with Sceaulx.——Among recent deaths to be recorded are those of M. Edouard Hardy, civil engineer, known for his improvements in mining engineering; M. Constant Brochart, a painter who was largely instrumental in bringing about the revival of pastel in France; and M. Vauthier Galle, a sculptor and medallist who has produced many fine coins and medals. He obtained the Grand Prix de Rome as a student, and four times received medals for his work in the annual Salons. In the Salons of 1850 and 1859 his "Printemps" and "Omphale" attracted much admiration.

## *MISCELLANEOUS.*

PROFESSIONAL AND BUSINESS ANNOUNCEMENT.—Mr. C. Evans-Vaughan, architect, has removed his offices from 25, Lowther-arcade, to 11, Adam-street, Adelphi.

BRIGHTON MASTER BUILDERS' ASSOCIATION.—On the 2nd inst. the annual dinner of the Brighton Association of Master Builders was held at the Clarence Rooms, Hotel Metropole. Alderman Botting, J.P. (Chairman of the Association), presided. After the loyal toast, Mr. H. F. Gates proposed "The Mayor and Corporation of Brighton," and Alderman Davey responded. Mr. J. K. Nye gave the toast of the evening, "The Association of Master Builders." Formed, as he understood, in 1893, the Association had been gradually, but assuredly, going on and working in the right direction, and the last report was most satisfactory, because it showed that the members had in no way diminished, and that financially they were in a very healthy position. There was only one ominous clause in their report, and that alluded to the strike. He thought in Brighton they were fortunate because they seemed to go on with their work irrespective of strikes. Speaking purely as an outsider, it seemed to him to be wicked that a skilled and practical workman was obliged to drop his tools and associate himself with perhaps an indolent and unskilful workman, whose object was to do as little work as he could and get as much as he could for it. That was no incentive to work, and he hoped the eyes of the British workman would be opened before he did away entirely with the trade whereby he lived. At Oxford recently Lord Grey suggested a kind of co-partnership between master and man, thinking it was somewhat degrading for a man to be always earning money and not sharing in the profits. He (the speaker) did not know what would happen when a loss was incurred. Their Association had started an insurance company, in face of the Workmen's Compensation Act, and he was pleased to find that was also in a most healthy state. Some thousands of shares had been taken up.—The Chairman, in responding, said it had lately been his privilege to attend, on behalf of the Association, several large gatherings in London, Derby, and elsewhere, and he found, after comparing their position there with their own, that they in Brighton were most fortunate. It happened in this way, the master builders of Brighton were very united, and determined to firmly oppose everything they thought was wrong. That was known in the trade—and it was known that it was good for the workmen that it should be so—and he believed that speaking generally the workmen were satisfied with the masters, and the masters with the men, Commenting on the Workmen's Compensation Act. the Chairman urged that instead of acting as a preventive in cases of accident and carelessness it had had the very opposite effect, deaths having increased 12½ per cent. and accidents 43 per cent. Locally, the master builders went fully into the serious position in which it placed them, and ultimately they formed an Assurance Company. They called in 4s. in the £, and that had given them a fund of over 3,000*l.* to which they could put their hands at any time. They had gone through ten months of the first year, and 100*l.* would cover all their claims. That showed their Company was in a very prosperous state, and that they had done quite the right thing. When the fund had reached 5,000*l.*, he thought the premiums might be reduced by one-half, which they would give as a bonus, and that in the near future the members would scarcely have anything to pay at all. They had all their funds well invested, and he thought no better plan to meet their difficulty could have been hit upon. In connexion with it they were very much indebted to Mr. J. K. Nye and to their Secretary, Mr. Emery.—The remaining toasts were "The Visitors" and "The Chairman and Vice-Chairmen."

THE DANGER FROM MANSARD ROOFS IN CITIES.—The Plans Committee of Aberdeen Town Council have resolved not to approve of the plans of new buildings with Mansard roofs unless a screen or some form of protection is provided. This regulation has been adopted owing to such roofs being a source of danger to pedestrians, as loose slates dislodged on windy days are apt to fall on the footway and not on the carriage way of the street below. In cases where the buildings are retired from the street, a screen will not be insisted on.

THE BYRON STATUE FOR ABERDEEN.—The committee in charge of this movement have resolved that the statue be of bronze with suitable granite pedestal, that it be placed within the grounds of Aberdeen Grammar School, and that the sculptor be Mr. Pittendrigh Macgillivray, A.R.S.A., Edinburgh.

HISTORIC HOUSES IN BATH.—The Bath Corporation, in pursuance of its scheme for affixing mural tablets on some of the many houses in the city possessing historic interest, have just caused one to be placed on the façade of 19, Bennett-street, where lived for some six years before his death, in 1814, Admiral Phillip, the first Governor of Australia.

APPOINTMENT OF SANITARY INSPECTORS.—The Local Government Board has sanctioned the appointment of the following sanitary inspectors in the undermentioned districts: Mr. W. Thorpe in Chelsea, Messrs. J. H. Danson and C. Langstone in Newington, Mr. J. Sanderson in St. Martin-in-the-Fields.

IMPROVEMENTS, CLEVEDON, SOMERSETSHIRE.—On the 4th inst., Col. Durnford, R.E., held an inquiry at the Public Hall, Clevedon, on behalf of the Local Government Board, into an application by the Clevedon Urban District Council for sanction to borrow 3,065*l.* for purposes of bridge and street improvement, and 233*l.* for works of sewerage The Surveyor, Mr. G. W. Knowles, explained the nature of the street improvements which were to be undertaken. It was proposed to widen Old-street in continuation of the Tickenham-road improvement. Of the Ken-road Bridge improvement, the Surveyor said that on account of heavy traffic by traction engines the crown of the arch of the bridge fell in, and the work of rebuilding had to be undertaken. It was thought advisable to have the bridge wider than previously. Details were also given of the works of sewerage.

LEEDS BUILDERS' EXCHANGE CLUB.—The committee of the Leeds Builders' Exchange Club have leased, it is stated, premises in the new block of buildings opposite the Corn Exchange. The present premises in Gascoigne-street have for some time been much too small. Since the establishment of the club some six or seven years ago the membership has steadily increased until at the present time it has reached considerably over 300.

THE LONDON IMPROVEMENTS BILL.—The London Improvements Bill, promoted by the County Council for the purpose of constructing a new central street from Holborn to the Strand and carrying out other street improvements, came again before a Select Committee of the House of Commons, presided over by Mr. A. H. Brown, M.P., on the 8th inst. The preamble of the Bill has already been passed by the Committee, and the sitting was devoted to considering amendments to the Bill and new clauses. At the opening of the proceedings Mr. Lewis Coward, on behalf of Lord Glenesk, intimated to the Committee that a clause had been agreed to with the County Council under which the *Morning Post* premises were to be the subject of reinstatement. It had been thought desirable that the reinstatement premises and the whole subject-matter should be clearly shown on a plan referred to in the clause as "the plan signed for the purposes of identification by Mr. A. H. Brown, the Chairman of the Committee." The plan had been agreed to, and had been signed by the representatives of Lord Glenesk and the County Council, yet he had since received a letter from the Parliamentary agents of the County Council saying that the plan, like the clause, was but a rough provisional agreement, which did not seem to them sufficiently formal and complete to be signed by the Chairman. Inasmuch as the clause had been agreed to, and had been passed by the London County Council, he asked the Chairman to sign the accompanying plan—a request to which the Chairman acceded. Lord Robert Cecil, for the Great Northern and Strand Railway Company, which proposes to construct a portion of its line under the new thoroughfare, asked the Committee to insert a clause providing that if any part of the lands between Clare-street and Hollies-street, over which powers have been obtained by the Company, be utilised for the purposes of the new street, the County Council shall sell to the Company other lands in the vicinity equally adapted for use as an access to any station the Company may construct near the Strand. Mr. Freeman, Q.C., for the County Council, after incidentally announcing that it was not the intention of the Council to apply the betterment principle to the underground lines of railway, went on to ask the Committee to reject the clause on the ground that the Company was seeking power to monopolise a right of way under the new street. The Committee, however, after a short deliberation, agreed to the clause and inserted it in the Bill. Amendments were then made in the measure in order to carry out the recommendations of the Committee, and the new clauses having been brought up by the promoters and agreed to, the Bill was ordered to be reported to the House.

English and American Bridge Builders.—In the House of Commons, on the 9th inst., Sir A. Hickman asked the Secretary for India whether the Indian Government had given the order for the Goktiek viaduct, containing 5,000 tons of steel, to an American firm; would he explain why the chief English bridge builders were not asked to tender for it; and whether he would give instructions in future that tenders should be invited from the chief British makers? Lord G. Hamilton: My hon friend has evidently been misinformed about this matter. The order for the Goktiek viaduct was not given by the Government of India, who have nothing to do with it, but by the Burma Railways Company. The company invited five English firms and two American firms to tender. Of the five English firms, four refused to tender; but one English firm, which had not been invited, asked leave to tender and was allowed to do so. Consequently two English and two American tenders were sent in. The most favourable English tender required three years for the work at a cost of 116,000*l.* The most favourable American tender required about one year for the completion of the work at a cost of 60,125*l.* In these circumstances the company, with the concurrence of the Government director (who represents the Secretary of State), accepted the American tender. The Indian railway companies give preference in all these contracts to British makers; but I am sorry to say that this is not the first contract in which there has been a marked difference, both in price and time of delivery, between British and American tenders.

The Preservation of Haddon Hall.—About a year ago much anxiety was felt as to the stability of the large tower near the entrance to Haddon Hall. His Grace the Duke of Rutland, who, as its owner, at once took steps to ascertain the actual facts of the case. More than one architect was consulted, with the result that it was ascertained that the tower was nearly 11 in. out of the line perpendicular, and that there was reason to believe that this disarrangement might increase. Acting under professional advice, his Grace resolved that the tower should be "underpinned," and the work has been entrusted to Messrs. Toft Brothers, of Youlgreave, and was commenced recently. When the necessary excavations were made, it was discovered that the whole tower rested on no solid foundation, but was built almost from the surface. It stands on a rock, but there were several feet of soil or shale between the base of the tower and the rock. The intervening space between the base of the tower and solid rock is now to be filled up with blue bricks. It is stated that other portions of the Hall are to be examined, and, where necessary, repaired, the Duke having decided to spend at least 300*l.* per year for three years, in order to preserve the ancient and historical pile as nearly as possible in its present state.

◆

## *CAPITAL AND LABOUR.*

Torquay Carpenters' and Joiners' Wages.—The master builders of Torquay have conceded the halfpenny per hour increase—from 7d. to 7½d.—which the carpenters and joiners in their employ intimated that they would require by May 1.

The Dispute in the Belfast Building Trade.—On the 5th inst. at the fortnightly meeting of the Belfast United Trades and Labour Council, Mr. Walker said he would like to announce that the building trade dispute, which had been going on during the past week, had practically come to a termination that day. The proposals of the employers had been fairly drastic, but every one of them, with the exception of the question of the addition of half a mile to the walking boundary, had been withdrawn. So they stood in the same position with regard to the employers as they did twelve months ago.

The Barnsley Dispute.—The masons of Barnsley are already on strike, as has been reported, and there is no change in the position of affairs so far as they are concerned. The general question raised by the decision of the Yorkshire section of the Builders' Federation, that 25 per cent. of the men employed be served with notice to quit their work, affects, of course, the other branches of the building trades. The Barnsley employers are not yet in a position to take any action in regard to it, but the whole subject will be considered at a meeting of federated employers to be held this week. Apparently there is a good deal of difference of opinion amongst the employers on the subject. Some are not members of the Federation, and it will probably be difficult to obtain united action at present.

The Strike at Messrs. Doulton's—Messrs. Doulton's clay pit men at Dudley, to the number of 250, still remain on strike, and the stoppage is seriously affecting the pottery work. Mr. H. L. Doulton refuses to treat with the Union officials, and the men agreed at a meeting to the dispute being decided by a Board of Conciliation as suggested by the Chamber of Commerce.

The North Walsham Dispute.—The North Walsham bricklayers' strike is all but at an end. The masters have agreed to pay the extra wage demanded, but they will have nothing to do with the proposed code of rules.

Carpenters' Strike, Cheltenham.—The carpenters in the Cheltenham district belonging to the Amalgamated Society of Carpenters and Joiners and the General Union came out on strike on the 2nd inst. The dispute emanated from a demand made to the Master Builders' Association in November last for an advance of a penny an hour. In February the employers offered a halfpenny an hour without prejudice. A joint committee meeting was held by the men on the 2nd inst., when it was reported that some of the smaller builders had conceded the demands of the men.—A threatened strike by the operative stonemasons has been averted. The men made a demand for an advance of ¾d. an hour, and the masters offered to concede an advance of ¼d. an hour and the alteration of a minor character in the working rules. The men thoroughly discussed the question, and in the end have decided to accept the ¼d. per hour in preference to coming out on strike.

Staffordshire Building Trade.—The principal item of interest in connexion with the building trade of the district has been the award of his Honour Judge Jordan on the arbitration in reference to the application of the joiners for an increase in the rate of pay, and a reduction in the number of hours worked. From all quarters reports are to hand that the decision is far from being an unqualified success, both masters and men uniting in its condemnation. Bricklayers report employment as much improved, there being now only a small percentage unemployed. Joiners and carpenters are working well. Painters and plumbers are very busy, and overtime is general. Plasterers and masons are working full time. Labourers of all kinds are well employed, there being a constant demand for this class of operative. In all the brick and tileyards there is great activity, large orders being booked faster than others can be executed. At Leek all departments are busy, and there are no operatives out of work. At Crewe the trade remains in a satisfactory condition, and the operatives are averaging fully seven days per week. At Stafford and surrounding villages trade is good.—*Staffordshire Sentinel.*

The Dispute in the Norwich Building Trade.—Although there seems to be some prospect of a general lock-out in the building trade throughout the country as a consequence of the strike on the part of the plasterers, we are glad to learn that there is every probability that this extreme step will not be taken in Norwich. For some months past there have been negotiations going on between the masters and the men, the bricklayers, bricklayers' labourers, carpenters, masons, and now the painters having made applications for advances of wages. The masters have considered the matter in a conciliatory spirit, and while no definite arrangement has yet been arrived at, a conference is shortly to be held at which it is believed all matters in dispute will be amicably settled. In the meantime, extensive building operations are going on in various parts of the city.—*Eastern Daily Press.*

Building Trade Dispute at Leamington.—The members of the Leamington Master Builders' Association and the members of the Leamington and Warwick Branch of Operative Stonemasons of England and Wales are at loggerheads. Sometime ago the latter asked for an increase in pay of ½d. per hour, and that their hours of labour be decreased. The Warwick masters have granted the concession, but the Leamington masters not having yet given their decision, the whole of the members of the Leamington Branch have ceased work. The stonemasons point out that they have not had an increase in wages for twenty-three years.

The Morecambe Building Trade.—The Morecambe masons have come out on strike, after the expiration of a six months' notice, for an advance of wages from 9d., the standard rate, to 9½d. an hour. The Morecambe bricklayers have also come out, after asking for a halfpenny advance, and the acceptance by the masters of a code of rules formulated by the men's society.

The Hull Dispute.—A mass meeting of builders' labourers affected by the lock-out took place on the 5th inst. at the St. George's Hall, Story-street. Councillor G. Belt presided, and there were fully 500 present. It was unanimously decided that the men should continue to strenuously resist the new rules formulated by the employers, and the strength of the lock-out committee was added to.

Wigan Painters on Strike.—Wigan painters and decorators have come out on strike. The men have for some time been seeking an advance of wages and a definite understanding as to the employment of apprentices. The masters were willing to submit the questions in dispute to an arbitrator appointed by the Board of Trade, but the men desired that a local gentleman should settle the differences. The masters declined to accept the men's proposals.

Strike of Joiners at St. Annes, Lancashire.—Six months' notice for an advance in wages, from 8d. to 9d. an hour, expired on May 1 at St. Annes, and the masters not conceding the demand, all society men ceased work. Delegates from the men met representatives from the Master Builders' Federation, and asked for 8½d. for six months, to be then increased to 9d. They also wished to enforce the regulation in respect of apprentices, that one apprentice only should be employed to every six journeymen. The masters refused to grant anything, with the result that all society hands are out of employment.

Threatened Strike of Edinburgh Plumbers.—A meeting was held in the Edinburgh Oddfellows' Hall on the 5th inst. of members of the United Operative Plumbers' Association of Scotland and the United Plumbers' Association of Great Britain and Ireland (Edinburgh and Leith branches) to consider proposed amendments on the existing working rules and regulations. The proceedings were conducted in private, but it was intimated at the close that the chief points in the demand upon the Master Plumbers' Association at this time are that the standard rate of wages for competent workmen should be 9d. per hour, instead of 8½d., a minimum rate of 6d. per hour to apprentices at the conclusion of their apprenticeship; and overtime to be paid at time and a half. It was stated that the Master Plumbers' Association had refused arbitration in the matter. The meeting resolved that unless the demands were conceded there should be a strike on Saturday, 13th inst. It being believed that only about a dozen masters belonged to the Master Builders' Federation, it was agreed that employers should be individually asked to concede the demands, and sign the amended rules and regulations.

The Building Dispute at Wolverhampton.—The condition of affairs in connexion with the strike of bricklayers' labourers at Wolverhampton, who have been refused the demand of ½d. advance per hour, has undergone no material change during the past week. No communications have passed between the men and the master builders, and both are firm as before in adhering to their several positions. Since the masters declined the proffered mediation of the Mayor of Wolverhampton (Mr. Price Lewis), a meeting of the Building Trades Federation of Wolverhampton and District has been held, at which the members passed the following resolution:—"We, the members of the Building Trades Federation of Wolverhampton and District, regret that the master builders have refused to accept the Mayor's offer to act as mediator in the unfortunate dispute with their labourers, and begs also to tender to the Mayor its best thanks for the interest he has taken in the matter, and assures the labourers of the sympathy and support of all the affiliated branches." It is expected that a public mass meeting of members of the various societies will be held in Wolverhampton shortly.

Masons' Wages at Cardiff.—At a meeting on the 8th inst. of the Cardiff Town Council Mr. Crossman proposed that the wages of the masons in the employ of the Corporation be increased one halfpenny per hour as and from May 1, and that they be allowed one hour for dinner all the year round and permitted to cease work on Saturdays at noon. A letter was read from the Master Builders' Association stating that the state of the trade would not warrant an increase of wages. Upon a division the resolution was carried by a majority of seventeen votes to five.

◆

## *LEGAL.*

### A COUNCIL AND BUILDING PLANS.

The case of Fulford *v.* Blatchford came before a Divisional Court of Queen's Bench, composed of Justices Darling and Channell, on the 5th inst., on the appeal of Mr. Fulford, Town Clerk of Okehampton, Devonshire, from the decision of the Justices of Okehampton, who refused to convict the respondent of an alleged offence under Section 33 of the Public Health Amendment Act, 1890.

The facts, shortly stated, are these. Mr. Geen, of Okehampton, proposed to erect an arcade, and on May 28, 1894, deposited with the Urban Sanitary Authorities proper plans which described the houses therein otherwise than as dwelling-houses. The arcade was erected pursuant to these plans. On February 9, 1898, the tenants were summoned before the justices for using their "shops and offices" as dwelling-houses, contrary to the Public Health Amendment

Act, 1890, Section 33, and such tenants were convicted, as also was the builder. The present respondent was one of such tenants. On March 28, 1898, Mr. Henry Geen deposited with the Urban Sanitary Authority another set of plans which were entitled "Plans for domestic conversion," and they showed (1) ground floor, shop, and kitchen; (2) first floor parlour and bedroom, (3) second floor bedroom. These plans showed the second floor, which was not shown in the original plans, and also new windows and various other alterations, and, it was said, carried out in every way the suggestions made by the Medical Officer of Health in his report. It was said, however, that the buildings would still be deficient in the air space prescribed by the by-laws for dwelling-houses. The Council had never signified either approval or disapproval of the plans, and after one month had elapsed from the date of the deposit of the plans with the Council the builder carried out all the alterations and additions as shown therein. After the hearing of the information, the respondent obtained a situation at Plymouth, but his wife and children continued to reside at Nos. 10 and 12, The Arcade, for the purpose of carrying on and taking care of the business. The respondent occasionally returned and slept himself on the premises. On December 3, 1898, a fresh information was laid by the appellant on behalf of the Council against the respondent, and the authority to prosecute was given to Mr. Fulford on October 3, 1898, a date prior to the date of the alleged offence. This information charged the respondent with having from October 24, 1898, to November 8, 1898, used Nos. 10 and 12, the Arcade for the purpose of habitation, the deposited plan of such building having described such building otherwise than as a dwelling-house. The information was heard on December 14, 1898, and dismissed, and from this decision the present appeal was brought. The justices said that the offence charged was not for an infringment of by-laws, which would be a totally separate and distinct offence, and they were not prepared to say whether, under the circumstances, such an offence might not be committed by the respondent. They also found that under the section in question two things were necessary, (1) the plans must have been deposited in which the premises were described otherwise than as a dwelling-house, (2) subsequent habitation. Section 159 of the Public Health Act expressly provides that the conversion into a dwelling-house of any building not originally constructed for human habitation shall be considered a new building, and this, the Justices held, made the plans deposited by Geen on March 28, 1898, as plans of a new building within that Section, and, therefore, they said that, inasmuch as plans were deposited with the Local Authority describing these arcade buildings as dwelling-houses, the occupation by the respondent after such plans were deposited could not be taken to be an offence within Section 33 of the Act of 1890.

Mr. Duke, Q.C., and Mr R. C. Gen appeared for the appellant; and Mr. Foote, Q.C., and Mr. Bodilly for the respondent.

At the conclusion of the arguments of counsel their Lordships held that the Justices ought to have convicted the respondent, and remitted the case to them for that to be done. The appeal was therefore allowed.

## TIME PENALTIES IN CONTRACTS.

AT Yarmouth County Court recently, before his Honour Judge Wilmot, an action of some interest to builders and others was heard. It was brought by William Cork, builder, Northgate-street, to recover 79*l.* 17s. 8d., balance of an account for work done in connexion with the erection of a new shop and buildings in High-street, Gorleston, for William Hindle. This claim was admitted, but defendant pleaded a set-off of 73*l.*, and paid the balance, 6*l.* 17s. 8d., into Court. This 73*l.* was thus made up—15*l.* for reinstating defective plastering, 4*l.* for defective door fastenings, both of which were admitted, leaving the only issue for trial an amount of 54*l.* claimed by the defendant as time penalties in accordance with contract, being nine weeks at 6*l.* per week. Mr. E. Wild appeared for plaintiff, and Mr. J. B. Matthews defended.

Defendant's case was first opened. Mr. Matthews argued that defendant had sustained great loss by plaintiff's delay in executing the contract. The work should have been completed in six months by March 26, 1897. On account of one difficulty the architect extended the time to April 16, but it was months after that the contract was really completed.

Defendant said that in September, 1896, when he was in business, he decided to pull down his premises and rebuild. A contract was entered into with plaintiff, who commenced the work, and it made satisfactory progress until Christmas. Defendant had a contract with Stanley Bros., stonemasons, who finished their part of the work on January 11. Plaintiff was informed, but he practically did nothing that week, and defendant was continuously going to plaintiff. He had to enter the house on June 24, when the place was very unfinished.

Mr. H. D. Arnott, architect, Gorleston, said in 1896 he prepared the plans and specifications for the work which plaintiff started on September 28. The contract specified it was to be completed on March 25 following. Witness first became dissatisfied with the progress of the work shortly before Christmas, and frequent communications passed in reference to this. There was a certain delay through the stonemasons, but he made a liberal allowance for this in extending the time for the completion of the contract. At various dates there were only one bricklayer and one labourer on the job, but that was practically nothing. He was continually urging plaintiff to get on. It was the hardest contract he ever had, and he had written more letters over it than upon any other.

Mr. Alfred E. Stanley, of Stanley Bros., stonemasons, repudiated any delay on their part.

Mr. Wild's defence was that any delay was due to the stonemasons. Defendant had on this account allowed extra time, though he was not empowered under the contract to grant extra time. The work, it was suggested, could not possibly have been completed within the specified time, and therefore time penalties could not be recovered. Plaintiff was stopped from December 10 to January 11. The stonemasons finished their work on January 11, and plaintiff resumed work on January 14.

His Honour pointed out that plaintiff took all risks when he accepted the contract, and he might have cut it too fine.

Plaintiff said that the girder referred to was delivered three days before he was ready. It had to be cut before it was fixed, but that was on account of a structural alteration decided upon after the original specifications had been executed. He put the delay on the stonemasons, on account of whom, he said, he could only do his own work piecemeal. He estimated he lost quite 100*l.* in this way, as the delay was nearer twelve than three weeks.

Mr. J. T. Bottle, architect, said that no allowance was made for any delay, and if the delay attributed to the stonemasons had occurred it would be unreasonable and impossible to expect plaintiff to complete the work within the time allowed.

His Honour said he had some doubt whether the builder was not entitled to compensation for any delay by which he suffered. Mr. Wild's contention was that if plaintiff had been compelled to delay his own work through the fault of other contractors he should escape the operation of the penalty clause, but that was a point of law he was not prepared to decide. There had no doubt been delay on the part of the stonemasons, but that delay had been amply allowed for by defendant's architect. Plaintiff was bound by his contract, and defendant was therefore entitled to the amount claimed. He gave judgment for defendant, but granted leave to plaintiff to appeal.—*Eastern Daily Press.*

## BY-LAWS AS TO AIR SPACE, &c.

AT West Ham Police-court on the 3rd inst. Messrs. T. Welsh & Son, builders, of Forest Gate, were summoned for that they, having been convicted for an offence against the by-laws of the West Ham Town Council with respect to the sufficiency of the air space and the ventilation of a certain new dwelling-house, had still continued to neglect the provision of the by-law. Mr. Gwynne-James appeared for the West Ham Corporation; Mr. Saunders represented the defendants. Last year the defendants were engaged in the re-erection of the "Dew Drop" inn, at Arkwright-street, Canning Town, and on November 30 were convicted for infringing By-law 63 as to the air space and for neglecting to deposit plans with the Local Authority. Since then nothing had been done towards providing the air space set down as necessary in the by-law, and Mr. Gwynne-James, for the Corporation, now asked that a continuing penalty be imposed. Mr. Saunders said that by an error in one of the text-books he had been unfortunately misled and had given notice of appeal too late. Now his contention was that the offence was not one to which a continuing penalty was applicable. The building in question was not now in the possession or under the control of the builders. Messrs. Welsh had no right to go there and pull it down. If they did so, it would be a trespass, and it would be monstrous to fine a person for not doing what the law would not allow him to do. A number of decisions in cases bearing on the question were quoted, and in the result Mr. Gillespie said he had decided to convict. Section 158 of the Public Health Act of 1878, combined with the case "Rumbold *v.* Smith," made this a continuing offence, and the defendants would have to pay a penalty of 10s. a day for sixty days, 30*l.*, with 12s. court costs, or undergo a month's imprisonment. Mr. Saunders asked for a special case to be stated, and the magistrate said that the application could be made in the usual course. He would put no obstacles in the way.

## ALLEGED INJURY TO BUILDING LAND BY A RAILWAY COMPANY.

THE case of Davis and Others *v.* The London, Tilbury, and Southend Railway Company came before Mr. Justice Bigham, sitting without a jury, in the Queen's Bench Division on the 10th inst.; an action brought by the executors of the late E. C. Davis upon an award of an arbitrator appointed under the Lands Clauses Act, 1845, to ascertain the amount of compensation payable by the Railway Company to the plaintiffs for injuriously affecting their property by the execution of certain works at Tilbury by the defendants. It appeared that the plaintiffs, as executors, were possessed of three acres of building land, with a frontage on Manor-road, Tilbury, this road running in a direct line from the plaintiffs' property to the docks, and crossing the defendants' line by a level crossing, which is about 100 yards from the nearest point of the plaintiffs' property. In 1891 the defendants obtained an Act conferring upon them powers, including one to close the level crossing, and make a new road to connect with Manor-road at a point near the level crossing, but not touching the plaintiffs' property. By this new road which crossed the railway by a bridge the distance from the plaintiffs' property to the docks was about half a mile longer, and not level, and the plaintiffs claimed that this deviation and the closing of the crossing seriously affected the value of their property. The defendants, without admitting liability, allowed the matter to go to arbitration, when the arbitrator, after hearing evidence, found that the property had been injuriously affected and awarded the plaintiffs 300*l.* compensation.

Mr. Justice Bingham, after hearing the arguments of counsel, said that he was of opinion that there was no evidence to go before the arbitrator that the land was injuriously affected by the works in question, and gave judgment for the defendant company with costs.

Mr. Morton and Mr. E. E. Wild were counsel for the plaintiffs; and Mr. C. A. Russell, Q.C., and Mr. Colam for the defendants.

## MEETINGS.

### FRIDAY, MAY 12.

*Architectural Association.*—Dr. G. V. Poore on "Soil and Aspect in Relation to the Dwelling House."—7.30 p.m.

*Incorporated Association of Municipal and County Engineers.*—Eastern district meeting at Ipswich and Felixstowe.

### SATURDAY, MAY 13.

*Institution of Junior Engineers.*—Visit to the Royal Arsenal, Woolwich. Train leaves Charing Cross 9.20 a.m.

*St. Paul's Ecclesiological Society.*—Visit to Lincoln's Inn Chapel, under the guidance of Mr. W. Paley Baildon, F.S.A. 3 p.m.

*People's Palace Architectural Society.*—Visit to the Charterhouse.

*Northern Architectural Association.*—Excursion meeting. Members to assemble at North Shields Station at 2.48 p.m., upon the arrival of the 2.32 p.m. train from Newcastle. The Coach-lane new Board School will be first visited. The party will then proceed by the ferry to South Shields, where the following buildings will be inspected in rotation—New Variety Theatre, "Britannia Hotel," new residences at Westoe, and Mortimer-road Board Schools.

### MONDAY, MAY 15.

*Royal Institute of British Architects.*—Mr. H. H. Statham on "The Architectural Element in Engineering Work." 8 p.m.

*Surveyors' Institution.*—Mr. R. M. D. Sanders on "Land Purchase in Ireland." 8 p.m.

### TUESDAY, MAY 16.

*Royal Institution.* — Professor W. J. Sollas on "Geology." I. 3 p.m.

*Society of Arts (Applied Art Section).*—Mr. I. Hunter Donaldson on "The Artistic Treatment of Picture Frames." 8 p.m.

### WEDNESDAY, MAY 17.

*Builders' Foremen and Clerks of Works' Institution.*—Ordinary meeting of the members. 8 p.m.

*Society of Arts.*—Mr. J. E. Evans-Jackson on "The Law of Trade Marks." 8 p.m.

### THURSDAY, MAY 18.

*Carpenters' Hall, London Wall (Lectures on Carpentry and Joinery).*—Professor Banister Fletcher on "Timber Roofs, Tie Beam, and Hammer Beam." 7.30 p.m.

*Society for the Encouragement of the Fine Arts.*—Mr. H. Hewkley on "Lithography, Past and Present." Illustrated. 8 p.m.

*Royal Institution.*—Mr. Lewis F. Day on "Embroidery." III.—3 p.m.

*Society of Antiquaries.*—8.30 p.m.

*Institution of Electrical Engineers* (at the Society of Arts, John-street, Adelphi, W.C.).—Discussion on Mr. P. V. McMahon's paper on "Electric Locomotives in Practice and Tractive Resistance in Tunnels with Notes on Electric Locomotive Design." 8 p.m.

### FRIDAY, MAY 19.

*Royal Institution.*—The Bishop of Bristol on "Runic and Ogam Characters and Inscriptions in the British Isles." 9 p.m.

## RECENT PATENTS:

### ACCEPTED SPECIFICATIONS.

### *Open to Opposition until July 3.*

[1898.] 1,612, Clarke, Hewitt, & Stevens, Cement Kilns. 4,628, Imschenetzky, a New Refractory Material. 7,369, Martinelli, Valves. 9,313, Smith, Atmospherical Burners. 9,462-4, Naef, Smelting and Calcining Apparatus, and Production of Ammonia Cyanides, Coke, and Gas. 9,475, Boardman, Electrical Arc Lamps. 9,511, Clémançon, Rheostats for the Graduated Control of Electrical Resistance. 9,718, Strakosch & Schmid, Producing and Burning Acetylene Gas. 9,813, Bánki, and 11,276, Hildebrand and Others, Gas, Petroleum, and similar Engines. 9,935, Bührer, Brick and Tile Kilns combined with Artificial Drying Chambers. 10,019, Griffiths, Workmen's Time

Checking and Recording Machine. 10,044, Gordon, Regenerative Gas Furnaces and Gas Producers. 10,616, Thomas-Davies, Enclosed Arc Lamps. 11,574, Spence & Spence, Treatment of Sewage. 11,609, Sowry & Munslow, Electrical Fuses and Cut-outs. 11,716, Forbes, and 13,573, Soc. Chaussard et Cie & Vignes, Acetylene Lamps. 11,743, Woodroffe & Wright, Atmospherical Burners for Oil Lamps or Stoves. 11,962, Hughes, Automatical Prepayment Mechanism (Electricity and Gas). 12,007, Nesbit & Clowes, Water Heaters, Condensers, and Separators. 12,360, Halket & Kennedy, Safety Gear for Lifts. 12,667, Bartenstein, Device for fitting Reflectors, Shades, &c., to Lamps. 12,707, Winterflood, Automatic Valve Attachment for "Geysers." 12,799, Bowers, Tool Holders for Use in Lathes and Planing Machines and other Machine Tools. 12,880, Robertson, Turning and Screw-Cutting Lathes. 13,116, Von Welsbach, Illuminating Conductors for Incandescent Electrical Lamps. 13,206, Wattson & Sandford, Weighing Apparatus. 13,471, Wright, Astragals, and means for Securing Glass in Roofs. 14,004, Eastmead, Hoisting Apparatus. 14,139, Forbes, Manufacture of Acetylene Gas. 14,217, Wood, Electrical Miners' Lamps. 14,292, Leonard, Ball Cocks or Float Valves. 14,751, Hofmann, Grinding, Crushing, and Similar Machines. 14,761, Langdon, Electrical Safety Fuses or Cut-outs. 20,534a, McCartney, Gas Stoves for Water-heaters. 24,404, Hackethal, Insulating and Supporting Electrical Conductors. 25,267, Ferguson, Circles for Surveying or Levelling Instruments. [1899] 1,627, Treleaven, Insulators for Fastening Electrical Wires. 2,393, Howson & Fanner, Sinks. 2,569, Moyle, Ventilating Apparatus. 3,955, Parker, Pivotal Supporting Devices for Window Sashes, Doors, &c. 4,708, Helm, Waste Pipes of Sinks, Closets, &c. 5,043, Willner, Impregnating Wood. 5,502, Heller, Gas Burners. 5,702, Owens, Syphon Waste-water Flushing Closets. 5,783, Schwinning, Sorting Bricks, Stones, &c., According to their Weight. 6,074, Woebs, Clamp for Woodworkers. 6,269-70, Hall, Electrical Lamp Holders, and Combined Electrical Switches and Lamp Holders. 6,330, Tabor & Schrafft, Window Sashes. 6,505, Seward & Illingworth, Taps, Valves, &c. 6,595, Wellman, Seaver Engineering Company, Cranes. 6,643, Witham & Lord, Drawing Frames. 6,647, Lundbergs, Wall-plugs (Electrical). 6,686, Curran, Studding or Supports for Partition Walls. 6,780, Bräuer & Bauer, Diaphragm Pumps.

### ABSTRACTS OF PATENTED INVENTIONS.

555.—Burners for Soldering and Brazing: *A. Platt.*—A set screw joins the tube, having air-holes, to a lamp or vapour burner; for soldering purposes a hollow copper bit, into and around which the flame passes, is placed by means of a bolt in the mouth of the tube; for brazing the bit has its opening flattened. The burner, in a modified shape, can be used for removing paint.

556.—Traps for Drains: *A. A. Grist.*—The invention consists in forming the stopper of the inspection opening of the trap with a hinge, and attaching thereto a chain by means of which it can be lifted.

593.—Moulding Bricks: *Blackman Ventilating Company, W. W. Wardle, & W. Tattersall.*—As the cut bricks leave the cutting-table of an extrusion machine they become separated upon a number of boards, united together by slotted links and mounted upon V-shaped guide-rails, which slide transversely, owing to the action of toggle-links and a foot-lever, and so move the bricks clear from the cutting-frame; another board pushes the bricks off the linked boards on to another board, whence they are carried to the drying chambers.

632.—Electrical Switches: *W. M. Walters.*—The switch, adapted for use for an incandescent lamp, has a transparent cover and a small lamp to be connected by placing the switch arm upon a central contact, a spring pin on the switch arm engaging with a notched metal strip; a resistance may be put in circuit with the small auxiliary lamp.

664.—Waterproofing and Similar Compounds: *E. Toussaint.*—A composition is made of benzine (35 parts), resin or other gum (10 parts), and beeswax (1 part) for waterproofing purposes; also for coating plasters, walls, wood, paper, &c.

679.—Treatment of Alabaster: *H. F. Lamock.*—To harden and preserve unpolished articles fashioned of natural alabaster, they are first dried at about 80 deg. C. in a steam-heated chamber, then put into a vat containing a cold solution of fluosilicate of magnesium; and then taken out in order that the liquid upon their surfaces may soak into them; the process is repeated until they can absorb no more, after which the articles are dried in the open air, soaked in water and dried in the hot chamber, and are then ready to be polished.

684.—Artificial Stone: *W. A. Oakley.*—An artificial stone is produced by powdering and mixing together in equivalent parts certain natural earths possessing respectively acid and alkaline natures, so that when subjected to the action of heat each forms a flux for the other, colour effects are produced by the addition of metallic oxides, and imitation marble may be made in the process. The materials mixed either dry or wet, are fused and cast or moulded in fireclay moulds lined with plumbago, or they may be moulded into the required shape, covered with plumbago, cased in fireclay, and burned in a kiln. To induce the fusion and increase the hardness of the stone, its constituents may be mixed with powdered charcoal or some similar reducing agent.

796.—Pipe Jointing: *C. A. Higbee.*—Screw threads are cut in the spigot and socket ends, which are also tapered. The edges of the threads are cut away, and upon screwing up tightly the spaces between the threads become completely filled.

813.—Apparatus for Lifts and Hoists: *J. C. Etchells.*—The invention is devised for automatically unlocking or locking the door of the lift well when the cage stops or starts from the landing or floor. The projecting end of an arm fixed upon a rocking shaft is struck by a projecting plate upon the cage, and a radial arm engages with the inner ends of two levers which are pivotted to the frame and normally engage with the door and keep it locked. As the former arm is pushed in, the radial arm forces the inner ends of the levers against two springs, and so lowers the outer ends and leaves the door free, whilst pins upon radial arms or springs are lifted as the cage stops, and so serve to keep the door open.

830.—Building Blocks: *V. Micheli.*—A paste is made of argil, potters' earth, marl, sandstone, kaolin, "puzzolana," fossil earths, and similar clays, with which are kneaded lime, cement, ashes, silex, potash, &c., resins and oily substances being added; the moulded blocks are designed to take the place of iron, stone, or wood.

836.—Apparatus for Use in Wells: *Ingersoll-Sergeant Drill Company.*—For raising water from a well an open-ended delivery pipe is fixed within the pressure chamber, which, being open at the bottom and closed at the top, is put into communication with a compressed-air reservoir, so that the water it contains is forced up the delivery-pipe until the level falls just below the pipe's lower end, when some of the air escapes and water rises within the pressure-chamber, but is again pressed down as before; in a modified form the casing of the well itself is adapted to form the pressure chamber.

890.—Lift-valves and their Casings: *F. H. Mingay.*—The plug, made of cork or other compressible material is moved by a lever or other means, and its seat, which is tapered, is formed either in the tap body itself or in a separate piece to which the tap body is fastened, the valve may also be made to open inwards.

903.—Ventilators: *J. J. Cresswell.*—The inlet ventilator is intended to impart a rotary motion to the air, as well as to mix it with disinfectants or perfumes: a cylinder or tube is fitted with spiral or inclined vanes mounted upon horizontal axes and linked to a ring on which is a knob, by means of which the inclination of the vanes can be altered, appliances for disinfecting, aromatising, or moistening the air are fixed within a tubular passage along the axis.

1,002.—Electrometers: *A. A. Voysey & R. P. Wilson.*—For the purpose of measuring current supplied upon alternating current mains is used an electrostatical or other volt-meter by connecting it with the secondary of an air-core or other transformer, whose primary winding carries the current that is to be measured; pointers and scales, with switches for changing the connexions, are provided for current and pressure measurements.

1,025.—Joints for Thin Copper and Brass Pipes: *Elmores German and Austro-Hungarian Metal Company.*—The conically widened end of the pipe is turned around a metal ring fitted thereon, a packing-ring being inserted between the jointing edges, bolts and flanged rings draw together and fasten the pipes, and the inner surfaces of the rings are shaped to fit the widened ends of the tubes.

1,077.—Door-Knobs and their Attachment: *E. Taylor.*—A bush is screwed into the knob and is cemented in its place. Into a collar on the bush is screwed a headed screw from the inside, the screw-nick being at its outer end. The square spindle is screwed into the knob, when the screw is turned down on to one of its faces, or it is inserted into a squared hole in the knob and held by screwing down the screw into one of a number of recesses on the spindle; for the recesses made in ordinary spindles the screw may have a convex-shaped head.

## TO CORRESPONDENTS.

M. & F.—R. & W.—J. L. (Amounts should have been stated.)

NOTE.—The responsibility of signed articles, letters, and papers read at public meetings, rests, of course, with the authors.

*We cannot undertake to return rejected communications.*

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

We are compelled to decline pointing out books and giving addresses.

Any commission to a contributor to write an article is given subject to the approval of the article, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and *not* to the Editor.

## TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us *not later than* 10 *a.m. on Thursdays.* N.B.—We cannot publish Tenders unless authenticated by the name and address of the sender; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is given, nor any list in which the lowest Tender is under £100, unless in some exceptional cases and for special reasons.]

* Denotes *accepted.* † Denotes *provisionally accepted.*

### *Art in France in* 1899.

THERE seems to be a kind of lull in French painting and sculpture this year, which we may take perhaps to be preparatory to a great effort for the International Exhibition Year of 1900. People in Paris seem inclined to take that view, at all events. The Old Salon contains a sufficient number of fine and striking works to make a very good exhibition occupying, say two or three of the larger galleries, but the exhibition as a whole is one of the weakest we have seen, and even in the works of the best men it must be admitted that only in one or two cases can they be said to be at their best. The New Salon is so palpably weak that its continuance seems to be an effort, and one is inclined to think that the reunion of the two Salons, which is talked of as a possibility, is not unlikely to be brought about from mere inability of the younger to keep its place alongside of its older, greater, and more popular rival. The loss of Puvis de Chavannes is of course an irreparable one to the New Salon: and M. Carolus-Duran, who (though in so opposite a manner) has also been one of its chief supports, this year exhibits so little—a sketch for a picture of the Crucifixion and two bust portraits—that his works have to be looked for, instead of forming, as usual, a prominent part of the spectacle. The two Salons are accommodated, as before, in the Galerie des Machines, where we greatly regret to see, in the centre, a vast octagonal structure of piers and girders, evidently a preparation for the erection of a central dome for the 1900 Exhibition, for which the central portion of the roof will have to be removed and the grand continuity of the building spoiled. It is a great pity that so fine a construction should thus be broken into merely to serve the purposes of a temporary exhibition.

The Old Salon has its curiosities as usual. Among them is M. Béroud's "Aux Maîtres d'Autrefois," the interior of the Salon Carré of the Louvre, with some mysterious females in diaphanous drapery floating about in the air attaching garlands to the paintings of the old masters; a huge painting by M. Barbin of the execution of the Pazzi conspirators in the Palazzo Vecchio at Florence, a picture so large that one has to back through the doorway of the adjoining room to take it in, and in which the prevailing tone is that of a mahogany table. A ramping elephant tossing a tiger with his trunk represents a kind of art that would only be in place on the outside of a wild-beast show. The usual gigantic "hash of nudes" is provided this year by M. Le Quesne, who animates the reeds listening to Midas into a crowd of women; a work, however, with less of sprawl and more decorative lines than we sometimes find in pictures of this class. Among the large and prominent works of a more serious order is M. J. J. F. Aubert's "La Mission des Apôtres," or Christ's charge to the Apostles, a religious picture of good intent but hardly rising above mediocrity.

There are, as usual, a certain number of large works of purely decorative character and intention. Among these is M. Schommer's ceiling painting for the "Salle du Doctorat" in the new Sorbonne, in which a nude figure of Truth floats in the clouds and a seated student below, in robe and gown, looks up to her for inspiration; the combination is an odd one, but the design has that floating quality of composition which the French understand so well in ceiling-painting. M. Gervais rather throws away his splendid gifts on another odd combination "A la Gloire du Sculpteur Bachelier," also a decorative work, in which a nude angel with iridescent wings (which are given with fine effect) floats down the middle of a street of Renaissance Paris to greet the sculptor, clad in the ordinary dress of his period, an allegorical figure of France looking on with approval. It narrowly escapes being absurd; and though there is a brilliancy and force about it, M. Gervais has done far finer things than this. Among the decorative works one of the best is the landscape by M. Maurice Chabas for the Salle des Fêtes of the Mairie of Vincennes, a sufficiently conventionalised landscape in horizontal lines and fine and warm colour; the introduction of a spray of a foreground tree sprinkling the sky space has a good effect and keeps the rest at a distance. An enormous *plein-air* painting (it must be about 80 ft. long) of a football match is intended by M. Guillonnet as a decoration for the Lycée Lakanal, and may do well enough for that position, but it is not decorative in any proper sense of the word. M. L. E. Fournier's "L'Agriculture du Rhône," for the large room of the Prefecture of the Rhone, is a good work of mural decoration in a monumental style, and M. Jean Paul Laurens exhibits an extraordinary ceiling decoration for the "Galerie des Illustres" at Toulouse, in which the most prominent object is a lion upside down in the sky, or appearing so in its present position; the picture may explain itself better when it is placed in its intended position on the ceiling, but it is at best a confused affair, and hardly worthy of the painter's reputation.

Among the larger works not professedly decorative M. Debat-Ponsan contributes one of those works with a moral to which he is rather partial, "Le Christ sur le Montagne," where Christ appears on one side on a rising ground saying the words "That ye should love one another, even as I have loved you," while beneath extends a historical line of fighters, from the barbarous ages to modern times; the figures of Francis I. and Louis XIV. are prominent near the foreground, and various victims of war lie extended on the ground. This is a powerful moral essay, but it is not art, and fails as a picture; he calls it indeed "A Vision," but this kind of thing is more suited to a literary essay than a painting; one can never get over the incongruity of the collection of figures of different ages. M. Humbert's "Marie-Madeleine," a triptych, is a seriously intended work, showing the Magdalen in her unconverted stage on the right, a fine figure in rich costume; in the centre compartment she is seen weeping over the body of Christ, in the right hand compartment as a soberly dressed and reformed woman. This also is a kind of sermon in painting, but it is not without artistic power and effectiveness. M. Ferrier's "Eveil du Poète" another very large picture, is a purely ideal work, in which the figures of the Muses, in slightly misty drapery, dance across the picture towards the poet, who is wakened by a winged genius; the work hardly realises its aim, in an artistic sense, but there is a certain beauty both of fancy and line in it. M. Henri Martin continues his *pointelliste* style in his work entitled "Sérénité," which however is too vague in meaning to be of interest, and is in fact one of the weakest of this painter's works that we have seen. To go from the ideal to the real, another of the large pictures of the year is M. Tattegrain's "Saint-Quentin pris d'assaut—l'exode," an incident of 1557. This is one of the old class of historical pictures for which this clever painter has acquired a reputation; it represents the moment when all the women were ordered out of the half-ruined city to return to France; they press together up to the front of the picture, a miserable crowd, amid dead bodies and the débris of burned buildings, driven on by soldiers in the rear. The picture is crowded with detail, and is a kind of work which it is worth while to paint as an effort to present to modern eyes the realities of warfare in a more cruel age; though in this sense it falls short in power and reality of some of the painter's previous works of the same class. Among the painters of large works Mr. Smith-Lewis as usual occupies a prominent position as a painter of what may be called full-sized landscape with full-size cattle or horses on it; but he has deteriorated very much: in search of what he evidently considers breadth of style he has lost the element of beauty; his horse is as like parchment as last year; he is a painter who has spoiled a fine talent by falling into an exaggerated crudeness of execution.

The interchange of art between painters and sculptors is on the increase in France. M. Gerôme, for one, is now almost as much sculptor as painter, indeed it is to be hoped that his two works of sculpture this year (which, owing to the absurd want of system in numbering at the Salon, we were unable to find) are more important than his one picture; for the latter, a collection of four little scenes between Cupid and Anacreon, in one frame, cannot be thought worthy of his reputation; it is poor in colour and rather absurd in conception. On the other hand, it is interesting to find a great sculptor like M. Mercié exhibiting so fine and finished a painting as "Colére d'Amour," in which a beautifully designed nude figure of Cupid (the adolescent, not the infant Cupid) stands in the foreground with a frown on his face and about to fit an arrow to his bow. The picture is perhaps a little hard in style; its beauty is, in fact of a sculpturesque kind, but as a sculptor's picture it shows a wonderful versatility. Among the works of an ideal and poetic class, what may be called the symbolical works, M. Hippolyte Fournier's "La Convalescente" is really remarkable in conception. The scene shows a kind of cavern opening on the sky, with dark water at the bottom; out of the water has risen a bat-winged but not unbeautiful figure, the angel of disease, which, with feet still trailing in the dark water, lifts up a figure of a woman who is received by the winged angel of health above. There is no explanation in the catalogue, but that is the obvious reading; this is really a fine and original conception, and powerful also in artistic effect. It is a strange contrast to pass from this to M. Bouguereau's cold and harmless but correct classicalities, of which his "L'Amour et Psyché" is one of the best he has done, but the interest is all superficial and the painting, with all its correctness and finish, cold and commonplace in colour. A picture which may be classed with that of M. Fournier just mentioned is the fine work by M. Zwiller "Pour le Centenaire de la Réunion de Mulhouse à la France (1798-1898)." This represents a nude figure of a woman, with her back nearly turned to the spectator, the curves of the figure contrasted by the straight line of some black drapery hanging from her arm; she is engaged in writing an inscription on a mural tablet on the wall against which the figure is relieved. The work is fine in colour and altogether an original and poetic conception. Of the paintings which are simply nude studies M. Chartron's "Echo" is deservedly one of the popular pictures of the year, for its fine drawing and purity of line and sentiment; it is simply a figure seated on a rock in an open landscape; with no special suggestion of "echo," nor any poetic sentiment; it is simply charming—that is all, but that is much. In a lesser degree the same kind of innocent charm belongs to M. Nicolas Laurens's two girls, "Sur la Dune." A superior work in execution to either of these, because finer in colour, is M. Verdier's "Latet Anguis in Herbâ," a splendid piece of painting in its way, though disagreeable in the sentiment and expression indicated correctly enough in the title. Fortunately, also, we are not without one of M. Fantin-Latour's small but truly intellectual pictures, in which, as in his "Baigneuses" this year, we seem to forget mere paint altogether; these are not "nude pictures," but poems in which landscape and figures are blended into a kind of abstract conception, a poem in painting; though from their small scale they are lost, to most spectators, amid the crowd of large and flaring canvases by which they are surrounded.

Of M. Henner one would rather not speak, he makes one melancholy; he was once a fine painter of ideals, he is now a mannerist who repeats the same trick, an unwholesome one in an artistic sense, every year. Among works of the class called *genre* there are of course many that have more or less interest or pathos of subject, but which do not touch a sufficiently high artistic point to be worth singling out for mention. Mme. Demont-Breton has a rather fine picture of a Breton shrimper, apparently (the title, "Le Geernaedier," is probably a local term), going out to his day's work at low tide, "obscure lutteur fatigué de misère," though it is nothing like equal to her masterly work of last year. She exhibits also a small and delicate painting of a subject out of her usual beat; "Alma Mater," a Virgin and Child seated before a window opening—a kind of modern rendering of the Madonna. Two idyllic pictures are worth recording, M. Thivet's classic idyll "Doux Instants," and Miss Madeleine Smith's "Amour Maternel," where a peasant woman holding her child stands in front of trees and golden corn—a work of some pathos and individuality. Also one must not pass over the name of Rosa Bonheur, who exhibits a small work, "Vache et Taureau d'Auvergne," but, as in so many other cases, not at her best.

There are few portraits of consequence. M. Benjamin-Constant's "Mme. von Derwies" is a brilliant specimen of the *portrait de luxe*, in which, however, he is not equal to Carolus-Duran at his best; M. Léon Comerre's portrait of "M. Holtz, Deputé," is a good solid portrait of the realistic school, and M. Hébert exhibits a very charming portrait of a little girl the head only, painted with great delicacy of colour, and artificially relieved in effect by a black frame. It is noteworthy that Napoleon pictures are again rather numerous, but none of them of the first order; the best is M. Francois Flameng's of Napoleon riding in front of the standards after the battle of Iena—"Le Soir d'Iéna." That by M. Guillon, "Debarquement de Général Bonaparte en Egypte," though rather limelight in its effect, shows a characteristic figure of the young Napoleon, in his long-haired days, on the prow of the boat, determined to be the first to land. M. Marchand's "Le Soir de Rivoli" is a large theatrical painting, violent in colour. M. Georges Clairin has produced a couple of powerful pictures relating to the Egyptian Campaign. The one illustrates the "Départ des Conscrits à Louqsor;' the scene is the outside of a prison where the unfortunate fellahs, compelled to serve, show their heads at the grated windows, amid the lamentations of their families. The companion work (a puzzle to the spectator until the other one is seen), called "Le Retour des Conscrits," shows nothing but the heaped-up wastes of sand in the desert, with here and there some human remains, half protruding, of the troops who have died on the march. A small picture of modern battle, "Le Charge—1870," by M. Chartier, is remarkable for its defiant realism and total absence of stage effect. It is taken at the moment when the square of infantry are delivering their fire, the cavalry galloping furiously to get home to their object, men and horses falling, not in picturesque attitudes, but anyhow; the painter spares us the usual officer in a heroic attitude with his arm stretched out. It is surely in this spirit that battle pictures should be painted. One may note also that the fine French school of Still-Life painting keeps up to the mark; no finer example could be found than M. Grün's "Cuivres."

But the strong point of the Old Salon is in the landscapes, not on account of their number so much as the high quality of the best of them. M. Didier-Pouget's grand morning scene, "Bruyères en fleurs," with its forcibly painted foreground, the valley half dim with mist, and the table-land beyond just lighted by the morning sun, is enough in itself to crush all the landscapes at the Academy. Among other fine works are M. Quignon's "Les Coteaux de Verville," a landscape of cornfields painted in the rich full style of handling in which he treats that kind of subject; M. Simonet's "Soleil Couchant;" M. Harpignies' two works, "La Loire" and "Fin d'une belle Journée;" M. Lamy's "Souffles d'Automne," with the rather stormy sunset sky gleaming through the trees; and the two landscapes by M. Wallet, who seems to have rather successfully caught the inspiration of Harpignies. It is of interest to note also that one of M. Bonnat's two contributions is a landscape, and a very good one—the first one he has exhibited here, we believe; and M. Besset's "Tourettes-sur-loup," where a half ruined ancient masonry bridge, painted with great force, crosses the foreground, and the landscape is seen through the arch, is striking from its special treatment. One may observe, also, that there are signs of improvement in sea painting; there are some terribly bad sea pictures, to be sure; but M. Eysséric's "Au large" is much better than usual, and M. Jobert's "La Brume dans l'Atlantique," an immense painting of stormy sea under a dark sky, with a ship staggering in the background, half seen through the mist, is a really powerful and impressive work.

The New Salon professes, of course, to represent the more intellectual and experimental side of painting, and had some claim to that position at first, but this year its decline and fall is too obvious to be ignored. One walks round room after room without finding anything really worth stopping at, and many of the things that are hung are simply preposterous. There are some groups of small landscapes of delicate style, by M. Iwill and others, such as would be killed amid the crowd of the Old Salon; for the New Salon has always in the main consisted of smaller pictures, and it is notably the case this year. There are M. Cazin's landscapes, as perfectly balanced in style as ever, but not equal to those of last year, except perhaps "Lever de Lune." M. Cottet has made some pathetic studies of various single figures under the same title, "Deuil." M. Boutet de Monvel exhibits a very large work somewhat in the style of a mediæval tapestry, "Jeanne d'Arc à Chinon," intended we fancy for a decoration at Domremy; it is perfectly and absolutely flat, the figures looking as if cut out, and the gold ornaments on the dresses worked in relief, as in some of the early Italian paintings. The figures and faces themselves have plenty of character, but the whole work, as a picture, is rather playing at mediævalism. To go to the opposite style of things, M. Guillaume Dubufe has undertaken to paint a large decorative picture "In Memoriam" of Puvis de Chavannes, concerning which one's immediate thought is, how would Puvis de Chavannes have liked it? The idea of M. Dubufe painting a picture in homage to the great master of stern and severe decorative art seems rather absurd; he certainly never paid his idol the flattery of imitation, at all events. M. Courtois has a rather hard and conventional but finely designed painting of a "Jeune fille à la Source," a picture which carries one back to old times, and is in direct opposition to the movement of "progress" supposed to be represented by the New Salon; and from M. Courtens we have, as usual, a fine example of a wooded landscape with very bright and genuine sunlight pouring through the trees. M. La Touche's "Les Sonneurs," a man and two women pulling ropes in a belfry, with a background of stained glass windows, is a fine study of colour. M. Rousseau's cattle pictures are admirable, and M. Stewart (an American by birth) exhibits again some of his fanciful and poetic, but very thoroughly studied scenes, where nude figures are seen in the half light of a wood—"Chasseresses," and others of the same type. These, and some of the small groups of landscapes before mentioned, are among the attractions of the collection, but they are among a wilderness of oddities and worse.

Sculpture at the New Salon is not worth taking into account, it is so poorly represented. In the Old Salon the centre court is filled with the usual crowd of works in marble, plaster, and bronze, including some fine things; but the want of repose, the striving after sensation and after anything that will catch the eye, has unfortunately invaded French sculpture also to a great extent. We have for instance M. Bartholdi's monument to the French soldiers killed at Schinznach, an obelisk with a winged figure, as if flying, stuck on to it at one side, at the top, as if it were glued on; a treatment perfectly foreign to the genius of sculpture. We have M. Larche's great screeching bronze group of "The Tempest and the Clouds," which looks likely to knock one down. There are, however, fine works, though not so many as usual; among others M. Falguière may be congratulated on his model for the statue of Balzac, seated in a thoughtful attitude, caressing one knee with his hand. This is a fine work, and succeeds in investing the great novelist with a dignity worthy of his genius; a difficult task with a figure and face like his. M. Paul Dubois' "Souvenir," a wax group of two ladies, placed under glass in one of the picture-galleries, is a beautiful work in feeling, probably meant to be cast in bronze, for which, with the elaboration of the costume, it is most suitable. M. Ducrot-Icard has treated the figure of Jael with considerable power; he takes a sculptor's licence of representing her as nude, gazing down on the murdered Sisera with a countenance strongly marked apparently by remorse and concern at the act. Among other fine works are M. Moreau-Vauthier's "Bretonne," a fragment for a monument; and M. Jean Boucher's two works "Un Soir," two lovers seated together, and "Antique et Moderne," a plaster group of considerable originality and beauty. The antique spirit is represented by a draped man of Greek type of face, seated with face uplifted in a calm and serene contemplation; the modern by a nude female figure who sits with a book on her knee and her head leaning on her hand with a wearied expression of speculation. This is one of those works, at once sculpturesque in form and intellectual in signification, in which the genius of French sculpture has so often shown to advantage. We regret to observe the increasing tendency to polychromatic sculpture—polychromy of built-up material; it is apparently popular with the public, but it is a false form of art.

## THE NEW BUILDINGS FOR SOUTH KENSINGTON MUSEUM.

THE ceremony of laying the foundation stone for the new buildings to form the completion of the South Kensington Museum, which was performed by the Queen on Wednesday afternoon, in the presence of a distinguished "assistance," is a welcome proof that, after all these years of delay, the reproach of leaving our world-famed artistic Museum housed behind a brick wall is at last to be removed.

Since the date of the competition, in which Mr. Aston Webb's design was accepted, considerable modifications have been made in both the plan and design of the proposed building, although we are glad to say that the statement in the *Times* that "useless towers have been cut down" and that the elevation will be "comparatively unadorned," as if the architect had listened to the foolish clamour which demanded that nothing should be spent on the architecture of the building, is quite unfounded. Alterations have in fact been made rather in the way of improving architectural effect than reducing it. The central block of the façade has been lowered and widened, so as to give greater mass and breadth to it, and make it a pavilion rather than a tower. The treatment of the finish of this pavilion is suggested by that of the centre feature of the Certosa at Pavia, not of course in mere imitation, but a carrying out of the same leading idea, of recessed octagonal stories one over the other, the highest terminating in a small cupola. The rest of the façade has been modified in the direction of giving it greater breadth and continuity, and the main cornice is carried right round the building without a break, except at one point where the vertical line of a turret, which we think it will be better to preserve here, interrupts it for a few feet. The intermediate pavilions between the angles and the centre, seen in the competition design,* have been modified so as to reduce their prominence and rather alter their character; instead of rising above the main line of building, with angle turrets, the cornice line is continued across them, and a pediment introduced, giving a less Oriental and more classic character to the whole.

The alterations in the plan are of considerable interest. The lines of Brompton-road and Exhibition-road are not at right angles, and in the former plan the western end was canted inwards from the line of Exhibition-road in order to bring it to a right angle with the main front. It has been thought, however, that it was a pity to injure the vista down Exhibition-road by setting the line of building away from the road. Accordingly, in the plan as now arranged, the line of the west end of the building continues the line of Exhibition-road; the block immediately continguous to it on the south front is at right angles to it, but the whole line of the south front is laid out on a slight curve, so as to follow the line of the Brompton-road, the block at the east end being at a slight angle to the corresponding one at the west end of the façade. This can be seen on the block plan of the whole site given on p. 501; it will be better seen, however, on the detailed plan which we shall publish, along with the perspective view, next week. One point in regard to the plan, which is not yet settled, is very important. The reader will see that across the central court of the Museum, now existing, a one-story gallery is indicated by single lines. The wish of the architect is that this corridor should be introduced to complete the central axis corridor from south to north, which otherwise is interrupted at the centre of the building, and the access to the northern block and to the refreshment rooms could only be by a circuitous route. We regard this completion of the north and south axial line of the plan as absolutely essential both for architectural and for practical reasons. It is understood that the South Kensington officials object to it as spoiling the appearance of the courtyard. Our own impression is that the residents at the Museum do not want their lawn-tennis courts to be cut up. Another point which the architect has in view (not shown on this plan) is to form a wide road leading up axially to the centre entrance of the building, by taking a portion of Thurloe-square. At present, as every one knows, the access to the Museum from South Kensington Station is by a most accidental kind of route, through small streets lying at all angles to each other.

---

* Illustrated in the *Builder* of August 15, 1891.

The block plan of the neighbourhood (p. 501) shows what a remarkable collection of large buildings, symmetrically placed, will now be formed in this district. The scheme for treating the College of Science, opposite to the front of the Imperial Museum, is such as to form an architecturally fine *place* of what would be otherwise only a common road. The design of the projecting end pavilions of the Imperial Institute is to be repeated, with Mr. Collcutt's concurrence, on the opposite portions of the College of Science, so as to produce a symmetrical entry at each end of the road, the two blocks being connected by a screen. Where the road-line takes a sweep inward, opposite the centre of the Imperial Institute, this will be repeated in front of the College of Science, so as to afford a circular area, in the centre of which a monument or group of statuary can be placed. The whole effect will be very good, and to some extent a new departure in London, where we have hitherto paid so little attention to alignment and laying out of sites; and it is to be hoped that times are changed since the days when we could, through sheer carelessness, plant the Albert Memorial out of axis with the Albert Hall, and no one think anything of it.

## NOTES.

**The New Member of the Institute.**

It was an agreeable surprise to hear the announcement, at the last meeting of the Institute, that Mr. Bodley had joined its ranks. We only wish he had done so long ago. We hear that there is some disposition on the part of others of the "memorialists" to abandon the attitude of opposition and support the Institute; perhaps Mr. Bodley's example may be followed in other cases. Whether architecture is a profession or an art, it is for its interests that its representative body should be a strong one, and include all schools. The influencing of public opinion in the right direction may very much depend on this.

**A Municipal Opera House.**

We are glad to find the London County Council have been considering the proposal which has been made to them, in a petition signed by a great number of persons, to subsidise with public funds a national opera house, and that a Report on the subject has been presented by the General Purposes Committee. As to the question of actually applying public money to the support of a national opera house in London the Council do not as yet feel in a position to make any distinct undertaking, but apparently they are regarding the idea with no unfavourable spirit. We may quote the following sentences from the Report of the Committee:—

> "There is, however, one step which we think the Council would do well to take. If a national opera house is to be erected, it would be essential that it should occupy one of the most prominent sites in London. The Council will in the course of the next two or three years be laying out plans for the great avenue from Holborn to the Strand, and it occurs to us that in doing so the Council should reserve some plot of land which would be suitable for such an opera house. This need not involve the Council in any financial liability, as it is by no means improbable that private persons might then be willing to erect a theatre or to take upon lease one erected by the Council. The terms of the lease might be such as would ensure the undertaking being carried on upon the lines of a national opera house, with a view to the improvement of music and the education of operatic artistes. The Council might guarantee the capital, or enter into some other financial arrangement with its lessees which would give it a right to see that its conditions were complied with. In this way we think it quite possible that the objects aimed at by the petitioners might be obtained without asking the ratepayers to contribute to any portion of the actual expense."

Whenever and wherever the contemplated opera house is built, it is to be hoped that it will be a work of art in an architectural sense, as well as a satisfactorily planned theatre.

**Belfast Cathedral.**

The original scheme by Mr. Drew for an entirely new Cathedral for Belfast has been abandoned for want of any prospect of funds. It has now rather resolved itself into a scheme for a pro-Cathedral to be provided by a re-building of the Parish Church of St. Anne as a spacious "Basilican" church, at an ultimate estimated cost of 50,000*l.*, of which however very little is as yet realised, only about 15,000*l.* being in prospect at present. Tenders are now to be got for preparing the foundations, which will probably swallow up a considerable portion of the funds in hand, as firm ground is not to be met with at Belfast at less than 50 ft. from the surface. This does not look very promising for the completion of the work, but there is evidently a good deal of enthusiasm about it in Ireland, and it is to be hoped that this enthusiasm may take a sufficiently practical form to allow of the completion of the work within a reasonable period.

**South Kensington Museum.**

The ceremony of laying the foundation stone of the Victoria and Albert Museum on Wednesday was a very picturesque one, and to those who could forget the present and look down the unknown years to come it was an impressive one. Who will be the people who will take out that casket from the stone? Will they look upon it as some uncouth piece of workmanship, or will the world have become entirely scientific, and this age be looked back upon as an age of high artistic development? There is a sense of satisfaction in feeling that we shall have now something better for our great collection in the South Kensington Museum than the miserable set of out-houses or sheds that have hitherto fronted Brompton-road. The pavilion in which the stone was laid was a well-built wooden structure, almost more solid than we should have thought worth erecting as a temporary structure. The red and white striped awning and the groups of flags made a fine blaze of colour, and the sun coming out just as the Queen arrived gave the final touch to what was a very pretty sight. We noticed that the architect was spoken of among the audience as "Sir Aston Webb"; which, though incorrect at present, is probably only an anticipation.

**Accidents to Railway Servants.**

The Automatic Couplings Bill has now given place to the Railway Servants' Accidents Commission, this transformation scene affording another example of the approved Parliamentary method of temporarily shelving embarrassing subjects. The body over which Lord James of Hereford will preside has a short but comprehensive reference, and all friends of the railway workers will unite in hoping that a sufficiently unanimous Report will be forthcoming to enable Mr. Ritchie to draft another "Safety Appliances" Bill at some future time—with the intention of passing it. Although the manner in which the previous measure was dropped proved disappointing, the present procedure certainly affords every facility for the *pros* and *cons.* of automatic couplings to be thoroughly discussed, and for clearing the ground of exaggerated statements and unreliable estimates. The railway and wagon owning interests have a strong representation on the Commission, including as it does Sir George Paget, Sir Charles Scotter, and Sir Alfred Hickman. Mr. W. M. Ackworth has also rendered valuable service to railway managers by his various publications. One or two Labour representatives are included, and others whom one would have expected to find nominated will have their opportunities for service as witnesses.

**The London Gas Inquiry.**

Mr. Joseph Trenner, delegate from the Holborn Town Hall Conference of Local Authorities, and Mr. H. E. Jones, chief engineer and manager of the Commercial Gas Company, last week gave evidence before the Select Committee of the House of Commons. Mr. Trenner said that he knew of contracts which had been lost to manufacturers on the north side of the Thames owing solely to the fact that manufacturers on the south side could work their gas engines at a considerably less cost than those on the north side. Mr. Jones said that the area supplied by the Commercial Gas Company was chiefly occupied by the working classes, that the district had no attractive suburban quarter, no room for extension in buildings, and very few upper and middle class residents. Nevertheless, in the past six years they had gained over nine thousand consumers by coin-meter supply, and there seemed no limit to the extension of the supply on this system. Mr. Jones' evidence showed that although the Commercial Gas Company already supply gas at a cheaper rate than the Gas Light and Coke Company, the former Company would be able to sell gas at a yet cheaper rate if they were not heavily handicapped by the swamping of their legitimate coke market with coke from the Bromley and Bow Common works of the greater Company. Although Mr. Jones' evidence was mainly confined to the working of the Commercial Gas Company, it was in reality the strongest condemnation of the Gas Light and Coke Company which has yet been pronounced.

**The Workmen's Compensation Act.** THE case of Irons *v.* Davis & Timmins, Limited, makes it plain that those who have to adjudicate on the Workmen's Compensation Act should be careful not to extend its operation unduly. A boy, after an accident, was permanently injured in his hand, but was continued in his employment at the same rate of wages. The County Court Judge gave him not only compensation for the time he was unable to work, but 2s. 6d. a week for his life on the ground, under the first schedule to the Act—(1) *b* "Where total or partial incapacity for work results from the injury, a weekly payment during the incapacity," &c. The Court of Appeal held, however, that the plaintiff was not suffering any longer from total or partial incapacity. The point is less simple than it seems. For an accident may be of such a nature that it is not severe enough to prevent a workman from earning money in busy times and yet may incapacitate him when the labour market is glutted. The matter must, however, always be one of evidence, and *primâ facie* it is clear from this decision that where a workman is earning the same wages after as before an accident, he is neither wholly nor partially incapacitated. The case of Edwards *v.* Godfrey, also decided by the Court of Appeal on Saturday, has made it clear that a workman may sue an employer under the Employers' Liability Act, 1880, and if he fails he may proceed under the Workmen's Compensation Act. The words of Section 1, Sub-section 2, of the latter Act are:—"The workman may at his option either claim compensation under this Act or take the same proceedings as were open to him before the commencement of this Act." That is to say, he has two remedies open to him.

**Duty of Replacing Pavement.** A SOMEWHAT curious but interesting case is reported in the current number of the *Law Courts* — Crisp *v.* The London County Council. The latter body served on the owner of a house a notice under Section 106 of the Building Act, 1894, to do certain work to put the house into a safe condition. The owner having failed to comply with the notice the Council obtained an order from a magistrate, under Section 107, that the owner should do the necessary work within fourteen days. On his failure to do so the Council did the work. For this purpose part of the foot pavement had to be taken up. The work was done, the cost repaid by the owner, and the house subsequently rebuilt by the same person, but the pavement was never replaced. A woman was injured owing to the state of this pavement and sued the County Council, but Mr. Justice Wills held that there was no duty on the Council to reinstate the pavement after the hoarding had been removed. "Once," said the Judge, "they have erected the hoarding and put the dangerous structure into a safe condition their duty is, I think, at an end. The duty of taking down the hoarding and replacing the pavement lies upon the owner of the premises, as one of the ordinary duties attaching to the ownership of property." We confess that it seems to us that the replacing of pavements or anything else moved in order to make a dangerous building safe should be regarded as part of the work of the public authority. There is something too ridiculous in a public authority doing work to prevent a building falling down and injuring passers-by, and yet leaving the work in such a condition that those who use the street can be injured as they walk through it.

**St. Paul's Churchyard.** WE entirely agree with the letter that was addressed to the *Times* a few days ago, calling attention to the preparation for the erection of a new building on the north side of St. Paul's, on the same line as the existing buildings, thereby perpetuating the retention of the narrow street to the north. The opportunity should certainly be taken to set back the line and widen the street to correspond with that on the south side, both for the sake of traffic and for the architectural effect of the Cathedral.

**St. George's Church, Liverpool.** WE are glad to hear that it is probable that St. George's Church tower at Liverpool will be preserved; it is at all events to be left standing for twelve months after the body of the church has been removed, to see the effect; and there can be little doubt that after that it will be retained. The City Surveyor reports that the tower will be perfectly secure standing alone; there is no settlement of any kind, and the walls are 5 ft. thick. Mr. Arthur P. Fry, in the Liverpool *Daily Post*, has published a rather good plan for a suggested laying out of the site in connexion with the tower. We shall be glad of the result not only on account of Liverpool, but because it will perhaps serve as a good example to other cities which are too anxious to destroy their architectural monuments of a past time.

**Arbroath Shambles Competition.** WE had occasion only a few weeks ago to comment on the objectionable terms of the instructions to architects in the competition for the hospital at Little Cairnie, near Arbroath. But the Commissioners of Arbroath seem to be incorrigible. We now receive a copy of another set of competition instructions issued by them for new shambles, in which we again find that the statement that the Commissioners will "reserve the right" to obtain the assistance of a professional assessor, but "will not bind themselves" to do so; that they will not bind themselves to employ any of the architects competing; that they will not pay the premium to a competitor if they do select him to carry the work; and that they are not under obligation to carry out any of the plans submitted. Architects who compete under these conditions can hardly be surprised if they find the results unsatisfactory.

**Changes in the Strand.** ALL the houses between Carting-lane, formerly Dirty-lane, at No. 88 (east), and Ivy Bridge-lane (west), have been pulled down for the erection of some new shops, offices, and chambers, by Mr. J. Carmichael, of Wandsworth, contractor, after Mr. Joseph Sawyer's plans and designs. The greater portion of the fresh premises will occupy the space between the north ends of Cecil and Salisbury streets, which were entirely demolished for building the Hotel Cecil. The old entrance of Ivy Bridge-lane, at No. 76, was incorporated, in 1893, in the front of the Club Café, designed by Mr. P. E. Pilditch, and now the lane itself will be obliterated. Our more elderly readers will remember that it formed the descent, covered in, partly, by portions of the houses in Salisbury-street, along its east side, to the "Fox under the Hill," where, at Salisbury-stairs, the half-penny steamboats—the *Ant*, the *Bee*, and the *Cricket*—plied to and from London Bridge. The traffic was discontinued after the explosion of the boilers of the *Cricket*, by which six persons were killed and many more were injured. The lane was then closed by a gate at the Strand end, though for many years afterwards it could be ascended from the river-side. "Ivy Bridge" and "Salisbury-stairs" are delineated in S. & N. Buck's large riverside view, 1749. Ivy Bridge-lane marks the site of the Ivy Bridge—formerly Ulle-brig, cited by Stow as "now taken down"—across a stream that flowed from the Cock and Pie fields, near Seven Dials, and forms the boundary between the City of Westminster and the Duchy of Lancaster. Over its lower end stood the west portion of the concave circus which, together with its central flight of steps, the brothers Adam added to Salisbury-street, as rebuilt by Payne.

**The Royal Institution, Albemarle-street.** IN the course of next month the Royal Institution will celebrate the centenary of their foundation. Established in 1799 by Sir Joseph Banks, Cavendish, Sir Benjamin Thompson (Count Rumford), and others, the Royal Institution held their first meeting in Albemarle-street on June 5, 1799; for their premises there, originally five houses, L. Vulliamy built in 1839, the well-known façade, with its engaged Corinthian columns.

**Mr. Arthur Severn's Exhibition.** THE exhibition of water-colour drawings by Mr. Arthur Severn, at the Society of Fine Arts, is a very pleasing one showing a good deal of variety in style and subject. It includes both landscape and architecture; among the latter class of subjects Mr. Severn unfortunately seems to have been rather too much attracted by the Tower Bridge (not generally an attraction to artists); but he has painted some better architecture with care and effect. Among the landscapes "Afternoon Effect, Seaside" (80), "Clear Day, Coniston Lake" (63), and "Moonlight from the Casino Monte Carlo" (77) are especially good; and there is a beautiful study of "Daffodils in Duddon Valley" (61), which seems like a kind of homage to Wordsworth.

◆

## CARTWRIGHT MEMORIAL HALL, COMPETITION.*

RESUMING our account and notes of some of the drawings exhibited in this competition, we may premise that amongst the remaining competitors who have been unsuccessful, failure for the most part has evidently resulted from insufficient consideration having been given to the use of the building, and especially the first floor, on festal occasions. It has been very generally overlooked that "during municipal entertainments the building will be closed to the public," as stated in replies to queries, and many competitors have gone adrift by placing the cloak-rooms on the first floor, which is clearly quite wrong when the whole building is intended to be devoted to entertainments. In several instances the approach to the reception-room is very undignified, and in some cases worse than undignified—even dangerous. Many competitors have forgotten that even well-dressed crowds are sometimes attacked by panic, and that free, easy, and uninterrupted exits are of paramount importance when any large number of persons are gathered together in one building.

---

* Continued from page 464.

Messrs. R. Coxon & F. Sidney have, like many others, a good museum plan, but fail in the festal arrangements, the cloak-rooms being on the first floor, the central hall practically wasted, the balcony not accessible except from the art gallery and banqueting hall. The external treatment is monumental and in a good type of Renaissance, but is rather restless and so somewhat deficient in dignity.

Mr. W. H. Thorp has followed on the lines of the third premiated design with an east and west axis to his central hall. Here again we have a good museum plan, but the rooms on the first floor are thoroughfare rooms, and exits would be dangerous in a panic. The cloak-rooms are in a good position but not well arranged in themselves. The elevation is a good example of Italian Renaissance treatment but we think the attic rather too high.

Messrs. Hall & Davis have a plan which is good in many respects in general arrangement but spoilt in detail. The cloak-rooms are in the wrong place, the porter's room of abnormal size, and the effect of the central hall would be spoilt by the excessive width of the balconies. The economy practised by these gentlemen in the drawing of their elevations is not happy, as the north and south elevations, for example, are shown the same by the drawing, but on the plan the north and south sides differ.

Mr. W. J. Morley, of Bradford, has made a bold bid for success by sending in two designs. In one he has a grandiose plan of which, the details, however, are rather weak. The central hall has its axis north and south, as in the first and second premiated plan, and this, judging by results, lends itself to the better arrangement in general; but in this case there are faults in the detail of plan, such as wrong position of cloak-rooms, while the porter is hidden away, and some of the museum rooms or spaces would be absolutely dark. The elevation is effective and monumental, and we cannot but regret that the author did not concentrate upon the perfecting of this design the time which has been spent on the alternative, which is far inferior, although more economical in price. It is very seldom advisable in competitions for the competitor to spread his time and labour over alternative designs. It has sometimes happened that both alternatives are excellent, but far more often a good design is spoilt by being hurried to make time for an alternative.

Messrs. Eade & Johns have a good plan, and one which would be very effective in its interior arrangements, but not quite so effective as the first premiated plan. The cloak-rooms are too small and badly arranged, although in the right position. The elevation is good, well proportioned, and costly, and the figure at which the design is cubed is certainly too low, so that excessive costliness has probably had a great deal to do with the failure of these gentlemen.

Mr. Thomas Davison has one of the few plans on the lines of the third premiated, that is, with the axis of the central hall east and west, that is at all successful, and his design in this respect is very nearly, if not quite, equal to the third premiated. The elevation is quiet and dignified; the pricing perhaps a little low, the basement being priced at 6d., and the remainder at 1s., which averages something over 10½d., although the design does not look a costly one compared even with others, which profess to be cubed at a higher price. We fancy that in some cases the cubing of the competitors is not distinguished by that mathematical accuracy which is desirable. Inaccuracy in cubing, whether from carelessness or intention, is usually detrimental to one's chances of success in a competition, as every assessor who understands his work checks the cubing of likely designs; or, at any rate, has it done for him by a reliable surveyor or assistant.

Messrs. Bedford & Kitson have sent in another example of a plan with the axis of the central hall east and west, in this case with staircase at each end. The plan is good for museum purposes, but for festal occasions the circulation is imperfect and the reception undignified; the cloak-rooms, too, are inconveniently placed and arranged. The elevations are quiet and dignified, but the grouping is not altogether perfect. The price at which the design is cubed is much too low.

The design by Messrs. Bateman, Bolton, & Bateman is remarkable for its oddity. The reception-room, Mayor's parlour, and banqueting-hall are arranged as one long room divided by wooden screens, whilst the elevations are remarkable for having as their chief feature five enormous arches on the south and three enormous arches on the east. There is, perhaps, something in both of these ideas, odd as they may appear at first sight, but it would take very clever handling to produce a satisfactory result.

Messrs. G. H. Shackle & C. W. Baker with a poor plan have a good south elevation, which only wants a slight adjustment of the proportion between ground and first stories to be admirable.

Messrs. W. Haywood & W. H. Bidlake adopt the east and west axial line for their central hall, and produce a plan excellent in general idea, but spoilt by the undignified arrangement of the stairs, which have twenty-one steps in one flight, a disposition not only bad in effect but absolutely dangerous for a public building. The cloak-rooms are absurdly small, and the intention of utilising part of the museum and picture gallery for this purpose on festal occasions cannot be commended. The architectural treatment and detail doth externally and internally are excellent and effective, and absolutely free from any approach to hackneyed features. The design, as a whole, must be placed amongst those that are too expensive, the sum allowed per foot cube being inadequate.

Mr. C. H. Reilley has sought a monumental character by adopting Greco-Egyptian detail and solidity, producing a clever but questionable design. The ground-floor plan is effective, but the festal arrangements are not satisfactory, whilst even the severity of the treatment would hardly justify the low price at which the design is cubed.

Messrs. Sutcliffe & Sutcliffe have chosen the east and west axial line for their central hall, and give two staircases at the ends, but shut off from the hall, losing thereby in effectiveness; the arrangements for reception are not dignified. The elevation is well treated, but the price allowed in cubing is too low.

Mr. R. W. Bedingfield has chosen the north and south axial line for his central hall, but has spoilt the interior effect by giving too much balcony. The cloak-rooms are on the first floor, badly placed and badly arranged. The elevation is modern in treatment, excellent in design, dignified and free from affectation. The price allowed is reasonable. The same gentleman also submits a design in conjunction with Mr. Baines, which is decidedly inferior, being outré both in plan and elevation.

A grandiose and effective plan, though expensive, with the axial line of the central hall north and south has been sent in by Mr. J. R. Poyser. The reception rooms are well arranged for dignified ceremony and, although the cloak-room accommodation is inadequate, this is a design that, with more study in working out, would produce a fine building both in plan and elevation, this latter being well composed but needing refinement of detail and improvement of proportion. Unfortunately it is a costly design.

Mr. G. F. Borroman sends an elevation vigorously designed, but too florid and expensive for the price allowed. The plan is not up to the necessary standard for success, as although the central hall has a north and south axis, the stairs are poorly planned, the cloak-rooms bad, and the reception arrangements unsatisfactory.

Mr. F. Anderson has achieved originality by placing his central hall in the basement, which leads to curious developments of entrances and access stairs. The festal suite and cloak-rooms are badly managed.

Messrs. A. G. Humphreys and W. B. Hopkinson have a central hall of square plan, which, with the grand staircase, forms a very effective treatment. The plan, as a whole, would make a good art gallery, but would poorly serve for festivities. The elevation is powerful and dignified, though somewhat weird.

Messrs. Claude New and Neilson Clift have some clever and well drawn detail, but their design fails in the treatment of the first floor elevation. The plan lacks convenience for municipal entertainments.

The plan submitted by Messrs. R. Graeme Watt & Tulloch, with the axis of the central hall north and south and the grand stair at the north end, is very effective. The planning of the reception-room is good, but the cloak-rooms are not in the right place. The elevation with a dome is imposing, though somewhat overdone with sculpture and florid features. We think the cubing requires checking, as the design looks more expensive than the price makes it out to be.

Messrs. Clark and Hutchinson have designed a museum and art gallery, and have laid too little stress on the festal requirements, whilst a palpable error of judgment has led them to place the central hall at the back with a blank external wall, and to profess to light some of the museum rooms from courts 17 ft. wide and 48 ft. deep, a perversity that is the more to be regretted as the elevation has the makings of a fine design with a little more study.

Messrs. Malcolm, Stark, & Rowntree have based their design upon a different period of renaissance to any other competitor adopting the feeling of Elizabethan work as their *point d'appui*, and have produced a very dignified and suitable design. The plan fails in festal capabilities, the access to the reception rooms being deficient in dignity and the reception hall itself being virtually a *cul de sac*.

Messrs. J. Thomson and R. D. Sandilands place their central hall at the rear, making it virtually an independent room. The stairs are undignified, otherwise the festal arrangement is better than in very many plans, whilst the cloak-rooms are rightly placed and most excellently planned. The elevation treated with a dome is of municipal character and well-designed and the price is right.

Mr. H. A. Woodington has a good elevation, dignified and well grouped, with good detail and no affectation. His plan, the east and west axial line for central hall, is good for an art gallery, but fails for entertainment.

Messrs. C. H. B. Quennell and A. F. Usher have designed a central hall on the east and west axial line, which is finely proportioned and effective; but their plan, though good for a museum and art gallery, lacks convenience for civic functions mainly by reason of the distance of the stair from the reception-rooms. The elevation is dignified with a restraint that is admirable.

Messrs. H. & E. Marten give a north and south axis to their central hall, which is square with an octagonal dome and staircase at the end. Their plan makes a good museum and art gallery, and is very fairly suitable for entertainments. The elevation is ornate and fussy, though clever and well drawn, and would serve admirably for a casino.

Mr. R. J. Lovell has adopted the east and west axial line for the central hall, and with an octagonal dome over the middle has produced an effective plan, spoilt for festal purposes by the position of the cloak rooms. The elevation is clever and fairly suitable, though with a tendency to be florid.

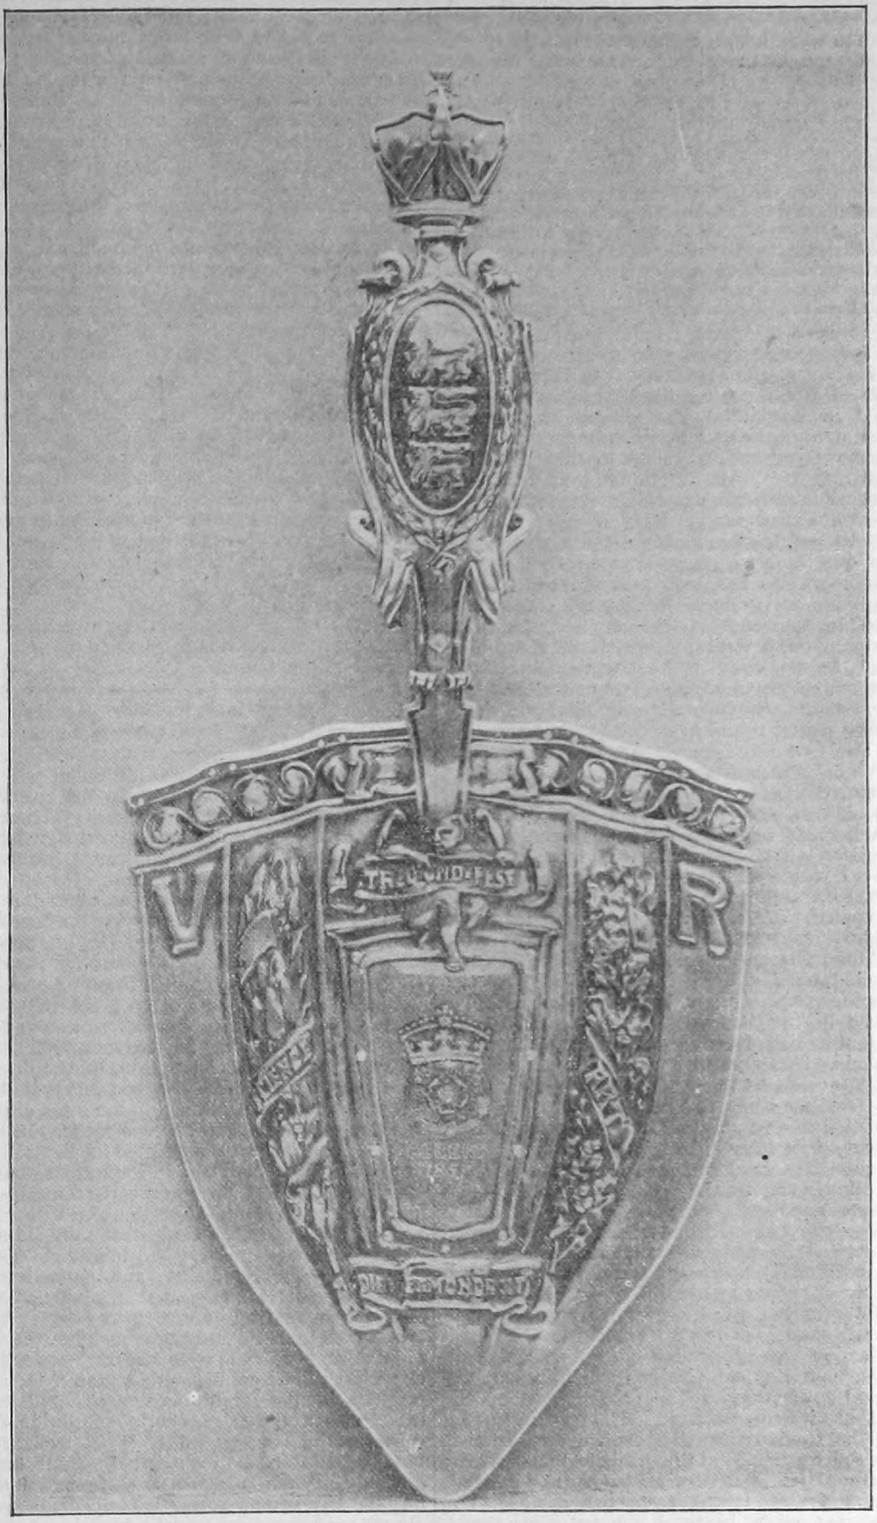
Messrs. Mawson & Hudson, while adopting the east and west axial line for their central hall, have departed from the general treatment by placing their reception rooms at the back on the north side, and their staircases on the south in domed pavilions. Their central hall is well designed, but the plan fails in convenience for entertainments. The elevation is dignified and well proportioned, and with the plan goes to make up a fine building, though probably too costly, in spite of the care bestowed on the estimate, unless the price of building in Bradford has not increased during the last few years as in other parts of the kingdom.

Messrs. John Sutcliffe & Lawrence Buck are set down as of Chicago, but their training has clearly been more influenced by Paris. The plan is French, the elevation French, and the drawing French. The plan is in many respects a good one, with the central hall on the east and west axial line and a central stair opposite the south entrance. The elevation is on Neo-Grec lines, dignified and scholarly.

Mr. A. J. Rowley has a bold and dignified elevation in which, however, the proportions would bear improving. His plan is one of those that give a good museum and art gallery but poor festal possibilities.

Messrs. Tate & Eagle show a well-designed elevation with good detail, but the plan fails by reason of the cloak-rooms being in the wrong place and badly arranged.

Mr. J. Coates Carter displays originality in his plan with a grand external stair leading to an open loggia on the first floor, and a carriage entrance to the ground floor under the loggia. His central hall is octagonal with a flat dome. The elevations are forcible, striking, and clever, but a bit wild; and, indeed, the whole design with all its cleverness is somewhat open to the charge of seeking originality by way of eccentricity.



*Trowel used at the Laying of the Foundation Stone of the South Kensington Museum Buildings. Designed and executed by Nelson and Edith Dawson.*

Messrs. Cheston & Perkin have submitted a design with an external treatment that is one of the finest, if not absolutely the best in the room, and most beautifully drawn by a draughtsman whose training seems to owe something to Germany, and whose work is on a par with the best continental productions. It is a pity that the plan is not equal in excellence to the exterior, but, like so many others, shows a good museum and art gallery, but poor festal opportunities. These gentlemen have been almost too honest in their estimate of the cost of their design, and suggest leaving out one corner of their building to keep within the limit of cost, yet the whole of their design cubes out at much less than several other designs, whose authors have a more elastic conscience or less experienced knowledge.

Messrs. E. R. Robson and A. J. Adams have adopted the east and west axis for their central hall, with the grand stand at the end. For civic entertainments their plan is spoilt by the reception hall and ante-room being far separated from the banqueting hall, with no dignified processional approach. The elevations are of a somewhat fussy and restless Neo-Grec treatment.

Messrs. T. A. Buttery and S. B. Birds place their reception rooms at the north side of the central hall, which is on the east and west axial line; the stairs are lacking in dignity, and the cloak-rooms wrongly placed. The exterior is very magnificent, with a great dome over the central hall, but could not be built for the money.

Messrs. A. Cox and F. D. Clapham have sent in a nice quiet elevation, but their plan on the usual east and west axial line has the also usual fault of defective festal arrangement.

Messrs. T. Worthington & Sons have contributed some beautifully-executed drawings with elevations of suitable and refined character in monotint. Their plan, though following the favourite arrangement of central hall, is fairly well adapted for entertainments.

Mr. Thompson James has endeavoured to weld together the art of Egypt and the latest development of Arts and Crafts, with a result not altogether unsatisfactory, though needing rather some hammering together. The plan follows the general east and west axial disposition.

Messrs. Pearce & Horsley place their central hall at the rear with the grand staircase in front of it on a north and south axial line, and produce a good plan on this basis. Their elevation is somewhat commonplace, and spoilt by a florid domical roof in the centre of the south front.

In connexion with the exhibition of these drawings, the promoters have made two departures from the usual practice which call for comment. In the first place, the reports of the authors are attached to their drawings in every case—a proceeding that is worthy of being generally followed in the exhibition of competition drawings. There are often points on which one desires information in making an examination of designs, and if the report is not available this information is often not forthcoming. The other departure from the usual procedure is one that is worthy of strong condemnation. The names of the authors have been attached to all the designs without, as we understand, their consent being first obtained. In our experience it is usual for promoters of competitions to ask the permission of unsuccessful competitors before affixing their names to their drawings, and the failure to do so must be considered, at the least, a gross breach of courtesy on the part of the promoters.

◆

## TROWEL USED AT SOUTH KENSINGTON.

ONE is glad to notice that the decorative trowel used by the Queen at the ceremony of laying the foundation stone at South Kensington on Wednesday was not the usual "shop" production. It was designed and executed by those original artists Mr. and Mrs. Nelson Dawson, whose work of this kind has been known in the Royal Academy sculpture room during the last two or three years.

We give an illustration of the trowel; we regret that we have not space for one of the box made for it by the same artists, which is in itself a work of art. The trowel is of silver with some armorial devices and mottoes in enamel.

The trowel was presented by the architect, who naturally, therefore, was able to exercise his own choice of an artist to carry it out.

◆

## THE ROYAL INSTITUTE OF BRITISH ARCHITECTS:

### THE ARCHITECTURAL ELEMENT IN ENGINEERING WORK.

AN ordinary general meeting of this Institute was held on Monday, at No. 9, Conduit-street, Regent-street, Professor Aitchison, R.A., the President, in the chair.

The minutes of the last meeting having been taken as read,

Mr. H. H. Statham read a paper on "The Architectural Element in Engineering Work," of which the following is an abstract :—

Mr. Statham said he hoped no member of the Institute supposed that this paper was intended in any sense as an attack on the engineering profession. So far from entertaining any such intention, it seemed to him that in the century just drawing to a close engineers had played a far more important part in the world than architects. This was partly, no doubt, owing to circumstances not altogether within their own control, but which they had turned to splendid account. The enormous development of locomotion by means of steam power, which would be remembered in history as the great characteristic of the present century, had led to a demand for immense constructional works all over the world for the crossing of rivers, valleys, and estuaries. The viaduct was to the nineteenth century what the cathedral was to the twelfth, thirteenth, and fourteenth centuries.

Many persons, artists especially, had been mournful or indignant over this, and complained that the world was getting covered with structures which had no beauty. He had not much sympathy with this constant depreciation of engineers and their works, and considered it to be very much exaggerated. What was the real mistake of modern engineers he would come to presently. But in regard to a large proportion of the purely utilitarian structures which had been erected by engineers, he held that there was a great deal more of interest in them than many of those who complained of them were able to perceive. Structure was in itself a subject of great interest, and those who could find nothing to admire in a great piece of construction devised to overcome a practical obstacle to intercommunication or locomotion gave evidence not so much of a superior as of a one-sided education. You could hardly design a structure to overcome a great natural obstacle, or to resist one of the great forces of nature, without giving it a certain character, an interest of its own, provided it was carried out in a simple and unaffected manner, and with direct reference to its practical purpose. You could not build a stone bridge across a river without producing a fine object in the sweep of the arch and the resisting mass of the abutments. A suspension bridge, again, with the catenary curve of the chains designed for us, as it were, by nature herself, was so beautiful an object that it was exceedingly difficult to spoil it. Engineers had succeeded in spoiling it in some cases, as he would have occasion to show, but it was because they were not always content to let it alone sufficiently; and where the span to be bridged was a large one, even the girder was redeemed in our eyes, or should be, by its obvious practical suitability to its purpose. The girdo-phobia, as we might call it, of many artists and persons of æsthetic sensitiveness was exaggerated. A girder bridge was certainly not so pleasing in its lines as an arch or a suspension chain, but, after all, it was only a beam on a large scale. If a structure of this kind was let well alone, simply treated as a piece of unadorned construction, it would in a sense make its own æsthetic. On the Intercolonial Railway in Canada, across a good many of the minor valleys the line was carried on lattice girder-bridges supported on simple rectangular pyramids of undressed stones, rather wider at the top than the width of the girder, and without any "treatment" of any kind, the girders being just laid across the tops of these stone piles. These really looked quite picturesque; it was the Dartmoor rustic bridge on a large scale.

Going through some lantern illustrations of engineering works of a practical and unadorned character, among others he would point to the lattice girder bridge near Fribourg, on lofty lattice piers, as an erection which illustrated favourably the argument that perfectly frank display of structure in engineering works, with no pretence at ornament, was not offensive to picturesque effect; at all events he could not regard a structure like this as an injury to the landscape. The same remark applied to the Crumlin Viaduct, a structure of the same class. Whether the Forth Bridge was or was not an ugly thing was a point on which there might be a difference of opinion. Probably it would be viewed in different lights according as people knew anything about construction or not. Those who did, regarded it with interest; those who did not, probably with some bewilderment. As to artistic or decorative treatment, any attempt at that in a work of this kind would have been preposterous, and would have defeated its own ends.

Coming to the arched masonry type of structure, after mentioning some older examples, he referred to Kingston Bridge, London Bridge, and new Putney Bridge, all very fine structures which had this quality in common, that they were treated with the greatest breadth and simplicity, relying for their effect entirely on the disposition of the masses of masonry, not even indulging in the use of an order on the piers.

Taking bridges in which masonry was used in combination with iron construction, we had in the Victoria Bridge over the St. Lawrence a remarkable example of what was suggested before—that a structure built to resist the forces of nature would almost always have character and interest. Here we had simple massive stone piers, which on the up-stream side were carried out in long spurs to meet and break up the ice coming down after the thaws. There was not a particle of ornament, but the piers and the great box girder laid like a beam over them formed a most impressive structure, which would only be weakened by any attempt at ornamental treatment. The Menai Tubular Bridge was built amid many criticisms to the effect that it was a thing of no beauty, which would be an injury to the effect of the suspension bridge, &c. Yet Hamerton, one of the most discerning and enthusiastic of art critics, wrote of it some time after:—

> "The whole bridge is admirable as a work of art, though the art is very simple and severe. The long line of tube (which looks like a great beam) is fortunately broken by the piers of marble which are finished above the beam as towers, and the majesty that naturally belongs to a work of colossal size and weight is enhanced by the prudent use of some architectural adornment. The tubular bridge over the River Conway near the castle is less fortunate, because the neighbourhood of a great mediæval building led the architect of the bridge to adopt a castellated style for the entrances to the tubes—a style which might be more or less in harmony with the fortress, but would scarcely in any other situation have been chosen to accompany a bridge which was nothing but two parallel beams."

Taking examples of suspension bridges, the Menai Suspension Bridge was in every respect one of the most beautiful structures of any kind in England. The simple but massive treatment of the towers, spreading toward the base, was admirably suited to their situation and function. All the things they had been looking at hitherto were characterised by simplicity, sometimes showing nothing but the unadorned construction. It was within the last quarter of a century or so that the minds of engineers had been poisoned with the terrible ambition to produce "handsome" structures, and in the endeavour after that they had entered on a field for which their training had in no way fitted them. It seemed impossible to get engineers to understand that the handling of decorative architectural detail was a matter requiring special training.

The two mistakes we most frequently met with in these ornate modern engineering works were, coarseness of design in ornament and mouldings, and want of perception of scale. In fact, it appeared that engineers hardly realised what scale meant, and thought that a detail which was good on a small scale was good on a large scale, which by no means followed. *Scale* might be regarded in two lights. It consisted, firstly, in so proportioning all the parts and details of a design that they should have a harmonious relation to one another, which might be called perception of scale in the abstract. There was also what might be called conventional scale: the recognised and habitual proportion to each other of details (such as those of the orders) which had by long use come to have a certain recognised relation to one another, so that a use of one of them on an entirely different scale to what we were accustomed to confused our sense of proportion in the structure. This sense of scale was conventional and acquired, no doubt; but if these conventional materials of architectural design were made use of at all, they ought to be used with knowledge and not at haphazard. After citing some examples, especially Blackfriars and Hammersmith bridges, of bad detail and falsity of scale, he directed attention to illustrations of the bridge at Coulouvrière, near Geneva, which was understood to have given the suggestion for the Vauxhall Bridge design. The general aspect of the Coulouvrière Bridge, from a distance, was picturesque, but the details would not bear examination, and in fact, from an architect's point of view, it was a very bad design. The columns on the bridge had no proper foundations, but were bracketed out over the side in a very clumsy manner. The decorative details showed badly designed *rococo* ornament meandering partly over the surface of rusticated quoins, to which they bore no relation. The archivolts of the arches were strongly emphasised by sham quoins of very pronounced character, executed in cement in imitation of stone. In the Vauxhall Bridge design immense quoins, with a rustication of 1 ft. projection from the wall-face, were carried round the archivolts. The defect of this design, in regard to appearance, was that it was unusually thin at the crown of the arch; the concrete construction allowed of this, but in facing it with granite the visible arch looked exceedingly thin and weak at the crown. By emphasising the archivolt course by rustication, and at the same time entirely separating it from the spandrel masonry, which was kept quite flat, this thin and weak appearance of the visible granite arch was increased; and at the same time the large and deep cornice, of very coarse mouldings, still further reduced the visible depth of the arch at the crown. The details showed a complete ignoring of scale. The single moulding which crowned the plinth of the main piers was nearly 3 ft. in vertical height, and this magnified moulding operated to reduce the whole scale of the rest of the work, making the quoins on the face of the pier, which were really very large, appear trivial; while the insertion of a necking moulding on the semicircular projection on the face of the pier at once transformed it to a column of immense thickness, and quite out of proportion to any function of a column in such a position. The whole thing was a jumble of incongruous details, put together by some one who did not understand the language of architectural design.

The problem of treating a concrete bridge with a granite facing was, in fact, rather a new one; the granite was here, in reality, only what the French call a *revêtement*, and should be treated accordingly.

In regard to the general subject of the designing of bridges, he would suggest that if it was urged that, in the case of bridges which were to be decoratively treated, the engineer should be assisted by an architect, why should it not be put the other way about—that an architect should build the bridge assisted by an engineer? Architects were not familiar with the problems incident to forming foundations in deep water, in the bed of the sea or of a river; but as soon as the structure cleared the water, if it was to be an architecturally treated bridge, it was really more of an architect's business than an engineer's. But he feared that this was throwing an Apple of Discord on the board.

---

Lord Wemyss said he was in thorough sympathy with the view that some of our bridges were horrors, and that the design of such works should be, if possible, under proper control. Putney Bridge was, in his opinion, one of the most lovely bridges on the Thames; but as to the Forth Bridge, it had destroyed the landscape and one of the most beautiful places in the world—Hopeton. He should have thought that the engineer could put up suitable bridges without destroying the beauties of the landscape. Hungerford Bridge, again, looked to have great ugly elephant legs, and it was between two of our most beautiful bridges—Waterloo and Westminster. He felt that models of all works of this description and of public buildings, should be prepared and exhibited, for models were everything: drawings told very little. He wished that the Institute would declare itself to the same effect, and that they would do so in reference to such a great chance as now presented itself, viz., the proposed public buildings in Parliament-street. He might add that he was surprised the Institute did not move in the matter of the decoration of St. Paul's Cathedral—that they did not petition and help to save the building. That had been done by others, and he believed, he was glad to say, that the stencilling and black-lettering were to be removed. Models ought to be prepared, and *in situ*, for all public work. It was the only effective check on municipalities, and others. In the original design for the Admiralty building there was a tower of nearly 400 ft. at the corner of the Horseguards! What would the Horseguards have looked had that been erected? When a model was prepared the unsuitability of the tower was seen at once. He was endeavouring to get a model prepared of the proposed Cromwell statue. At the Tate Gallery it was proposed to erect a statue of Millais. The question was, shall the statue be on the steps of the Gallery or in the garden? A model was prepared, when it was found that the statue was out of place on the steps, while in the garden it would have the effect of dwarfing the building.

The Chairman said that he had seen Mr. Akers Douglas as to the designs for the Government buildings, and he tried to impress on that gentleman the importance of having models made. He understood that models were to be made.

Lord Wemyss said that at first nothing was going to be done; then the designs were put in the tea-room of the House of Commons—that was what was called a public exhibition, but a peer could not get in to see them unless he was personally conducted by a member of the Commons—and now the designs were to be put in the Victoria Gallery, which would be open to the public. But models had not been prepared, and he maintained that they were wanted.

Mr. A. T. Walmisley said that there could be no doubt they were all in perfect sympathy with the arguments of Mr. Statham—arguments which had been so ably put and so interestingly illustrated. There was no occasion for architects to do their own engineering, any more than there was for them to do their own quantity surveying, and engineers should seek the artistic co-operation of architects in the design of detail. The architect had in early life neither the taste nor the opportunity for the pursuit of mathematics, which were essential to an engineer in his work; furthermore, it needed engineering experience to arrive at the correct data for units of calculation. While engineers should be responsible for the stability of structures, architects should always be called on to deal with the artistic elements. He had been glad to hear Mr. Statham's remarks in reference to the lantern illustrations. As to the Forth Bridge, and Mr. Statham's remarks upon the importance of paint for engineering structures, there was this difficulty about that bridge—the tubular struts could not be painted inside. Had they been made of open lattice-work, which could have been easily arranged, they would have been accessible to the painter's brush, and that would have been better; otherwise the bridge was a very fine example of engineering talent. One bridge over the Thames which had always commended itself to his judgment, and which Mr. Statham had not alluded to, was the Victoria Railway Bridge at Battersea. The towers of the Chelsea Suspension Bridge were only patchwork, covering the true towers; but in the Victoria Bridge, if they examined the parapet, they would see that it was essentially an engineering design—it could not be made in masonry. They had no right necessarily to make iron structures imitations of masonry, as had sometimes been done.

Mr. Henry Lovegrove said that the late Sir Horace Jones designed the architectural part of the Tower Bridge before he died, and that Mr. G. D. Stevenson, who had been his assistant, finished the details by order of the Corporation.

Mr. Statham said that that was not so. Sir Horace Jones made a design, but the one carried out was as different as possible.

Mr. Beresford Pite, in proposing a vote of thanks to Mr. Statham, said that the lecturer's remarks must have carried conviction to their minds, and his arguments and the skilful arrangement of the illustrations might have similarly convinced an engineering audience. There was nothing so certain as ocular demonstration, and they had been favoured with that as well as with a skilful analytical criticism. As soon as they accepted the fundamental principle that the simple expression of a building gave it dignity of purpose they arrived at a basis of certainty in most problems which presented themselves to the designers of bridges or viaducts. A tendency to ornament, however, was necessary to the human being—the savage decorated himself—and the engineer felt he must decorate his buildings; but if Sir Alexander Binnie, for instance, in regard to the design of Vauxhall Bridge took up the same attitude as did Sir William Richmond in the decoration of St. Paul's, we should be in an *impasse*. The Institute as a body were not content to let these matters alone. They had persistently approached the Bridges Committee of the London County Council in spite of some coldness on the part of that Committee, and the interference of the Institute would, he hoped, be beneficial to the interests of ornamental art. They did not quarrel with the structure, but they felt that the application of experience to the detail would be beneficial. The Institute had also been moving in the matter of the decoration of St. Paul's. A public protest, printed in the *Times*, had been drawn up by the Institute, as well as a similar protest in regard to Vauxhall Bridge. Since then, negotiations had been going on in reference to St. Paul's, and there were well-founded hopes that the interference had not been in vain. They could not publish all they did, for that would defeat the ends they had in view; but the Institute, as a body, might rest assured they, the Council, were doing all that was possible in the matter.

Professor Kerr seconded the vote of thanks, and said he feared that the system of exhibiting illustrations on a screen was, to a certain extent, delusive, for photographs reproduced on the screen were taken from the point of view of the artist. He had listened with much pleasure to the interesting address by Mr. Statham; it was not so academical as he had expected, and that was all the better. It was a suggestive paper, and the chief suggestiveness of it was this: That as architecture from the architect's point of view meant the beautification of building, why should not the engineer's building be also beautiful? The first principle was that the construction should be correct; but a second principle was that that construction should be administered with an eye to grace. He saw no reason why the works of the engineer, particularly bridges and the like, should not be as gracefully rendered as any architect's work. How was that to be accomplished? In foreign countries something was done—a good deal was done, as had been seen from the illustrations shown that evening. In this country he was afraid there was no engineering example which might be said to be up to the mark as an effort towards the beautification of structure. There was no reason for that. They did not insist on the engineer doing the work of beautification himself; on the contrary. The architect did not hesitate to employ the decorator to do the purely decorative work of a building. For the credit of the nation something ought to be done by the Institute and its friends in the direction of a more desirable end. A fine bridge in accordance with its surroundings was not what he understood to be the architectural treatment of a bridge; but the conventional, or, at all events, the highly artificial treatment of its construction, upon constructive principles, but also upon conventional principles which had gradually grown—not in one nation alone, but in the whole community of nations from the commencement of time, constituted a volume of knowledge which surely could be applied to engineering works quite as effectively as to the works of the architect. As to the preparation of models, on the continent it was the rule to exhibit models for all public monuments of reasonable size before the works were carried out, and it was a great mistake that the same was not done in this country.

Mr. W. Woodward said that most members of the Institute would agree with the general principles which Mr. Statham had given them in his paper with regard to the almost universal ugliness with which engineers clothed their constructional works, but there were two instances which Mr. Statham had forgotten to mention where not only were the structures in themselves exceedingly ugly, but they had tended considerably to spoil excellent views of two of the most magnificent structures in the world; he referred to the railway bridge across Ludgate Hill, which so dreadfully interfered with the view of St. Paul's Cathedral, and the ugly structure, with lattice girders, which crosses the Tiber, and which interfered with the view of St. Angelo and St. Peter's. They must all agree with Mr. Statham's condemnation of Blackfriars Bridge, and as to the Forth Bridge, he wished the lecturer had given more emphasis to its unmitigated ugliness. As to Vauxhall Bridge, at an early period in the design for the bridge a meeting was held between Mr. Waterhouse and Mr. Mountford and the Engineer to the London County Council, Sir Alexander Binnie. Subsequently Messrs. Waterhouse and Mountford wrote to the Engineer and expressed their entire satisfaction with the design, subject to a few alterations. That being so, he did not understand the action of the Institute in publicly condemning the design for the bridge. As to the detailed criticism of Mr. Statham, that gentleman referred to the columns carrying nothing. Why, that was almost a modern feature of the high art architect's designs! In dozens of cases he could mention that had been done by those architects. As to the covering of granite condemned by Mr. Statham, surely he was aware that one of the finest features in the decoration of Italian churches was a facing of marble. Why the concrete construction should not be cased with an excellent, durable, external polished surface in the form of granite he did not know. There was no objection to that. As to the columns carrying nothing, they carried the lamp standards; and altogether, instead of the bridge being of unmitigated ugliness, the members of the Institute who had seen the design must have been struck with its dignity. It would be a credit not only to London, but to the engineer who designed it.

Mr. E. W. Hudson said he wished there were more beautiful examples of bridges across the Thames. He admired Westminster Bridge, which appeared to him to be one of the lightest and most appropriate bridges on the river, and he should like to know what Mr. Statham thought of it. He did not know if they should call it a sham because the cast-iron work had been treated in the Gothic manner. There was the bridge crossing the Thames at Hampton Court, which must have offended their eyes many times, and it was unfortunate that there was no public protest at the time of its erection, and that it was not made more in accordance with its surroundings, and a nobler structure than it is. Mr. Statham had been rather hard on Thomas Page in regard to Chelsea Bridge; the chain was a thing of beauty, though he (the speaker) must agree that some of the ornament was very much overladen. Mr. Statham objected to the mediæval castellated bridge piers at Conway, and as to that, was it to be taken that all mediæval design applied to a bridge was out of place? Would it not have been quite in accord with good taste to have had a Gothic bridge across the Seine in the neighbourhood of Notre Dame rather than one of Classic form? He did not for a moment suggest that it was better to have what might be described as a forgery; but that it might be designed in the style of the buildings of a mediæval date.

Mr. E. W. Mountford said he felt glad Mr. Statham had shown the views of the bridge upon which the design for the proposed new Vauxhall Bridge was supposed to be based. It seemed that Sir Alexander Binnie had been successful in reproducing the objectionable features of that bridge without its compensating good qualities. Looking at the original, one could see the value of those immense piers coming between arches of such great span. There were two piers of apparently 30 ft. in width, which of course gave the necessary feeling of strength to the bridge, which the present design for Vauxhall Bridge wholly lacks. That was not Sir Alexander Binnie's fault, for the Thames Conservancy limited the size of the piers. When the Committee of the Institute, some six years ago, prepared a design for the bridge they did not alter Sir Alexander Binnie's design in any essential feature, but they did take the liberty of increasing the width of the piers 4 ft. or 5 ft., and they were told at once that that was impossible, because the Thames Conservancy had fixed the size and nothing larger was possible. It was quite probable that the efforts of the Institute would not be entirely in vain. Mr. Woodward spoke of what he knew, but he, unfortunately, did not know much. Mr. Statham did not object to the casing granite at all; on the contrary, he approved of it. A gentleman near him (the speaker) had made a very good suggestion, viz., that the bridge should be cased in mosaic, thus giving Sir William Richmond another opportunity when he had finished with St. Paul's. The granite or some casing was necessary in order to preserve the concrete from the action of the elements, and if they could persuade the County Council to remove some of the superfluous ornament, he thought the bridge would not be a bad one. As to the letter from Mr. Waterhouse and himself, it ought to be explained that that letter was quite a private one to Sir A. Binnie, and it was written with a special object which he could not explain that evening. The bridge was a great improvement on that first designed by Sir A. Binnie, and with the general outline it was agreed that there was little fault to find. What they did find fault with was the architectural details — the mouldings and carvings and things of that sort, and of them they ventured to express their strong disapproval. The Institute had done a good deal to get the Dean and Chapter of St. Paul's to reconsider the decoration of that building and if the stencilling was removed, they might take some credit to themselves for that.

Mr. W. D. Caröe said that one of the chief points of the paper, which had been brought out very well, and which it was a pity could not be more generally known by the public, was as to ornament—the proper use of ornament in design. As to Vauxhall Bridge, with its columns extending into the air and carrying dolphins, the suggestion made at the recent Architectural Association soirée was a good one, viz., that they were intended to be drain ventilators. And that led to another point. The County Council had been spoiling the Embankment at Chelsea by putting up columns of about the same height as the proposed columns at Vauxhall Bridge, but in this case they were really drain ventilators. Obviously, if such things were necessary, they should be treated in the most simple and straightforward manner, and to treat them "ornamentally," as the London County Council had done, was a great mistake. That was a special case of the seeming impossibility for the engineer to realise what ornament was for. The London County Council said that these "ornamental" columns had been adopted after grave deliberation.

The vote of thanks was heartily agreed to.

Mr. Statham, in reply, said as to Mr. Walmisley's remarks about painting the Forth Bridge inside, that that was contrary to his recollection. He had a distinct recollection of seeing an internal hand-ladder for going up the tubular struts; and he thought the matter had been provided for. As to Professor Kerr's remarks about photographs on the screen being delusive, that in some respects was so; but photographs showed the general character of a structure, and while they could cook a drawing they could not cook a photograph. It was really a difficult matter to illustrate a subject before a large meeting in any other way. As to whether or not engineering works should all be beautiful, he had given his reasons for thinking that in some cases it was almost a waste of time to ornament a thing—a railway girder, for instance, which served purely practical purposes and which had to be considered in relation to the dividend. To treat it ornamentally would be out of place. A girder, as a thing of pure construction, was not so ugly as some people appeared to think, but we had had only three quarters of a century of it and had not got used to it. In regard to Westminster Bridge, it was a very creditable attempt to make a bridge look well, but it lost its interest as soon as one knew that those elliptical arches which rise at the piers and turn over with graceful lines were not the real iron construction, which went behind them. As soon as he knew that he felt his respect for the graceful lines diminish.

The Chairman said that Mr. Eidlitz, the well-known American architect, in a letter read before the Institute about a year ago, pointed out that beauty in nature depends on perfection of structure, and no doubt if architects and engineers were as able as nature they would, as a rule, in solving a problem produce as beautiful a result; but, unfortunately, they had not nature's skill, and had to hide their failure with extraneous ornament.

It was announced that a special general meeting will be held on Monday, the 29th inst., to receive and consider a recommendation of the Council to suspend temporarily the regulation under by-laws 3 and 7 and to admit to candidature as a Fellow Mr. Bodley, A.R.A. The election to take place at the business meeting on June 12, after which an ordinary general meeting will be held, when a paper will be read by Mr. T. J. Bailey, on "Planning and Construction of Board Schools." The meeting then terminated.

## THE ARCHITECTURAL ASSOCIATION:

### ASPECT AND SOIL IN RELATION TO THE DWELLING HOUSE.

THE last ordinary fortnightly meeting of this Association for the present session was held on Friday last week in the Meeting-room of the Royal Institute of British Architects, No. 9, Conduit-street, Regent-street, Mr. G. H. Fellowes Prynne, President, occupying the chair.

The minutes of the last meeting having been read and confirmed, the following gentlemen were elected members of the Association:—Messrs. W. H. Baines, H. MacGowan Bowes, J. Farraday, G. H. Lovegrove, G. A. Peache, W. J. Windrum, J. Saunders, and N. D. Sheffield.

The Chairman announced that the first summer visit will be held on June 3 to Cobham Hall, Kent, instead of to Hatfield, as stated in the last issue of the *Builder*.

Mr. G. B. Carvill, junior hon. secretary, proposed the following votes of thanks, which were heartily agreed to:—To the President, and to Mr. F. A. Walters for conducting visits over churches at Ealing on April 29*, and to Mr. E. R. Barrow for his hospitality on the occasion; and to Mr. H. Greville Montgomery for arranging the visit on the 6th inst. to the Building Trades Exhibition and for providing refreshments.

Donations to the Library having been announced, and votes of thanks to the donors having been agreed to,

Mr. E. Howley Sim, senior hon. secretary, announced that the annual dinner will be held on Wednesday, May 31, at the Holborn Restaurant.

### *The Travelling Studentship.*

The Chairman then announced that five sets of drawings were sent in in competition for the Travelling Studentship, and that after careful consideration of the drawings, which were of exceptional interest, and which reflected great credit on those who sent them in, the prizes were awarded as follows:—The Studentship awarded to Mr. D. T. Fyfe; the second prize of 5*l*. awarded to Mr. H. Tanner, jun.; and hon. mention to Mr. H. Farquharson.

Dr. G. V. Poore then read the following paper on "Aspect and Soil in Relation to the Dwelling House":—

Although I have presumed to accept the invitation of the Architectural Society to read a paper, I hope I shall be acquitted of any desire to step outside my province and to lecture architects on matters which they obviously understand much better than I.

My excuse for addressing you must be found in the fact that, as a physician and sanitarian, I believe that of all circumstances which make for or against the health of the public, the dwelling-house is most important.

The conditions under which dwelling-houses are built have been revolutionised by steam machinery. Houses are nowadays run up in a wholesale fashion. Modern facilities as regards water supply and sewerage have made curtilage unnecessary, and have enabled us to build towers of flats which, from the sanitarian's point of view, are most undesirable.

We all recognise that overcrowding is the greatest of social evils, whether it be regarded from the point of view of morals or health, and we all protest that it is useless to attempt to check it. Most of us, I hope, are sensible of the magic influence of the word "home." Many of us believe that the "home" and the "family" are the units out of which the greatness of a nation is constructed, and that if a nation is to continue to be imbued with feeling of true patriotism, the sacredness of the home and the sentiment of family must be maintained. I wonder if the offspring of parents who fluctuate between Capel Court and Newmarket, and whose only dwellings are West-end flats, on a three years' agreement, and rooms in hotels at fashionable resorts has any home sentiments? Would these sentiments be increased if his fashionable mother died of constructive murder in getting quit of that which might have been a brother or sister? and lastly, can any such sentiment persist if papa and mamma are finally poked into a fashionable crematorium? It is very doubtful if the sentiments of home and family are likely to be strengthened by the mode of life of what are known as "smart" people.

The opinion has lately been expressed by a great authority on labour questions that the industrial classes do not want "homes," and that anything which tends to fix them in one spot or to create an affection for any locality is contrary to their best interests. Labour must be organised as an army and quick mobilisation is essential if the fight with "capital" is to be successful. There can be no doubt that public opinion is at present mainly in favour of overcrowding in cities and further, there can be no doubt that overcrowding is encouraged both directly and indirectly by modern municipalism and the by-laws which regulate building operations.

Very little attention is paid in the present day to the aspect of a house, and it is evident that the public barely consider the question of aspect. The speculative builder considers the question of cost and cost only, and until the public recognise that aspect has a real money value and is worth paying for there is no likelihood that the question of aspect will trouble the mind of the builder. It appears to me that the engineer and the surveyor have too much the "whip hand" of the architect, and that by the time the building estate has been laid out the whole question of aspect has been practically settled, and the architect has really no choice in the matter.

In the Thames valley, where I have a cottage, I have for the past twelve years watched the "development" (so-called) and the wholesale urbanising of a rural spot. This process is a simple one and is familiar to all of you.

1. The locality is constituted an "urban district."
2. The Council is elected for three years.
3. The Council immediately borrows a sum which works out to about 10,000*l*. for each councillor, and thus increases all existing rents for thirty years at least.
4. The roads (main roads and by-roads) are all provided with sewers and water-pipes.
5. The lands abutting on these roads suddenly change from farms and gardens to building sites.
6. These lands are bought by building societies or building speculators, and are laid out with one object, and one only, in view, *i.e.*, the placing thereupon of the maximum number of houses which is permitted by the by-laws. This means that no house has any curtilage other than a backyard 25 ft. deep.

In "laying out" a building estate the new roads are almost invariably at right angles to or are parallel to existing roads, and it is needless to say that they are absolutely straight. Curves of beauty are scarcely permissible in modern sanitation. The result of all this is that the building estate when complete has all the regularity and symmetry of a gridiron. The houses are possibly all built to pattern. There is no individuality, no variety, no change, no rest for the eye.

The extent to which this kind of thing is carried is well exemplified in the district to which I have alluded, in which there is a "recreation ground" dating from a time anterior to the sewering and urbanising. This recreation ground is five acres in extent, and its northern and southern boundaries are formed by high roads, while its eastern and western boundaries are formed by market gardens, which, in consequence of the changes indicated above, have suddenly developed into building estates. One would have thought that the building speculator would have turned the fronts of his houses to overlook the recreation ground, and that by giving his houses (as he might have done) a south-easterly aspect with the pleasant prospect of the recreation ground he might have commanded some extra rent.

This does not appear to be the case, for the privies and wash-houses have been turned to the recreation ground, while the chief rooms of the houses look at their stuccoed twins on the other side of the street. The recreation ground will, I suppose, remain a rather gaunt spot, hedged in by prim railings and flanked by lines of fluttering linen. The opportunity of making a pretty "village green" has been allowed to slip, and I am not aware that the Urban District Council have troubled their heads about the question.

If we are to continue to build houses in a wholesale fashion in straight rows it is almost useless to appeal to the architect on the question of aspect, although some good might be done by directing the attention of engineers and surveyors to the matter.

If we concede that the best aspect for the chief rooms of a house is one looking to the south-east, then it is obvious that if the main roads of a building estate run from south-west to north-east, the houses flanking such road would have one side turned to the south-east. On the north side of the road the fronts would face the south-east, and on the south side the backs would face the south-east, unless the Local Council permitted and the builder were willing to allow the backs of the houses on the southern side of the road to be turned to the street. Speaking as a doctor, I have no doubt that it would be advisable to turn the backs to the street, if by so doing a good aspect can be obtained for the chief rooms. By adopting this plan we have the additional advantage of bringing the culinary and sanitary arrangements close to the street and thereby greatly simplifying the sewerage arrangements which would result in some saving of money. It is very important from the point of view of health that food should be stored in a cool place. Sour milk and putrid food is a great cause of infantile diarrhœa. This is an additional reason for the rule of "living rooms to the sun, larders and kitchens to the north."

I need not remind this Association that some of the finest houses in London (Hyde Park-gardens) are built with their "backs" to the street, and with the main rooms overlooking a private garden with the Park beyond. Whether houses with their backs to the street would meet with the approval of "the masses," I cannot say. A stuccoed head over the front door probably does more to let to this class of house than the fact of its rooms being exposed to the sun. If it were considered *essential* that the chief rooms of a house should face the south-east, there could be no difficulty in attaining this end (except in streets running from north-west to south-east), provided the houses were placed obliquely to the street line and were built *en échelon*, a mode of building which tends to secure privacy, although it probably adds to the expense of building and the difficulties of plotting out the estate.

---

* See our issue for May 6 for an account of the visit.

It is evident that the laying out of the roads on a building estate is a most important matter in relation to the aspect which the houses are to enjoy. Is it necessary that all such roads should be absolutely straight and at right angles to each other? Is it quite impossible to rest the eye and give some variety by an occasional curve? Is it any use to appeal to the ogre jerry builder on a purely æsthetic question?

The question of aspect is very much a question of sunlight, and there can be no doubt that sunlight has great influence on health. The Italians have a proverb which says "Dove non va il sole va il medico"—that the doctor comes to those places which the sun does not visit. It is an established fact that many of the microbes which are the causes of disease are killed by sunlight. This appears to be the case with regard to tuberculosis, and it is certain that there is most tuberculosis in places which are overcrowded, and to which the sun finds access with difficulty.

In the supplement to the fifty-fifth annual report of the Registrar-General is a table giving the annual death-rate per million living among children under five years of age from tuberculosis in the ten years, 1881-1890.

By selecting the death-rate among children under five we practically exclude the disturbing influences of varied age, sex, and occupation, and we may conclude that amongst this class the influences which make for health, or the reverse, are home influences. Again, when a man selects a house, no single consideration is of more importance than the effect which his dwelling is likely to have upon his children. This table of the Registrar General's is, therefore, one which ought to be carefully studied, and as it deals with a period of ten years it may be concluded that the statistical results arrived at are reliable.

Among children under five there is more tubercular disease in London than in any other county, and probably for the reason that the number of persons on a given area is greater in London than in any other county.

Thus the death-rates from tuberculosis are in

| | |
|---|---|
| London | 6,581 |
| Durham | 5,650 |
| Lancashire | 5,364 |
| Dorsetshire | 2,401 |

Again, when we come to examine the death rates from tuberculosis in the different Registration districts of London we find them as follows:—

| | |
|---|---|
| Strand | 11,881 |
| Stepney | 9,310 |
| City | 8,858 |
| Chelsea | 8,129 |
| St. George's, Hanover-square | 7,952 |
| St. Saviour's | 7,839 |
| Holborn | 7,876 |
| Westminster | 7,766 |
| Shoreditch | 7,675 |
| Poplar | 7,219 |
| St. George, E. | 7,204 |
| St. Pancras | 7,064 |
| St. Giles | 7,055 |
| Marylebone | 6,920 |
| Bethnal Green | 6,988 |
| Fulham | 6,731 |
| Kensington | 6,571 |
| Islington | 6,532 |
| Whitechapel | 6,098 |
| Paddington | 6,029 |
| Hackney | 5,989 |
| Mile End | 5,975 |
| St. Olave | 5,910 |
| Lambeth | 5,907 |
| Woolwich | 5,641 |
| Wandsworth | 5,581 |
| Camberwell | 5,537 |
| Greenwich | 5,528 |
| ENGLAND AS A WHOLE | 4,499 |
| Lewisham | 4,018 |
| Hampstead | 3,661 |

It is a remarkable fact that in only two of the registration districts in London is the death-rate of children from tuberculosis less than it is in England as a whole. In all the other districts the death-rate from the tubercular diseases is much higher than in the country at large. Possibly some of the figures are influenced by the position of hospitals, but not to any great extent. Seeing that tubercular diseases are all chronic, and that many children are moved out of London at the first threatening, I am afraid it is impossible to conclude that the figures give an exaggerated idea as to the extent to which the malady prevails in this dark, overgrown town.

This prevalence of tuberculosis is due to overcrowding of houses on the land and overcrowding of people in the houses, to the dirt-laden air and the darkness and the gloom.

In London it is almost idle to talk of aspect. If aspect is mainly a question of sunlight, then in London it is not only necessary to have your house facing towards the sun, but also to make sure that no screen in the shape of a tower of flats intervene between it and the sun. To discuss the question is almost absurd. If what I have said, and the figures I have quoted, are sufficient to convince you and others that the conditions which pertain in London are to be avoided in less crowded places, a good work has been done. To have your house facing the sun, and with its chief living rooms well exposed to it, means a considerable saving of fuel and gas. I am unable to tell you what is the potential value of the heat in a room facing south over and above that of a room facing north, but we must all feel sure that it is considerable. I am fond of telling people to look at the north and south sides of a garden wall. Go to the south side and bask in the brightness and warmth, feast on the peaches ripe and ruddy and listen to the hum of insects glinting in the sunbeams. Then go to the north side, damp all in chilling shadow, content you with a few hard pears or acid cherries, scrape off the damp mildew growing in the mortar and sniff the fusty smell arising from the dank sour soil.

It is idle to contend that aspect has not a most important influence on health. If a house face right and has a verandah, the occupants can often enjoy the fresh air, instead of crowding into a stuffy room.

If a dwelling be detached and isolated it is generally possible to give the chief rooms any aspect which may be desired. It is common to find, however, that detached villas have their fronts parallel to the road, even though this position should entail a north-east aspect. How far by-laws and regulations may be answerable for this state of things I do not know.

Not only on account of the freedom as regards aspect, but on the general grounds that overcrowding is to be lessened by every means in our power, it seems to me that sanitary authorities should encourage the erection of detached and isolated dwellings.

The most important part about a "home" is not the house but the garden round it, and I have no hesitation in saying that the children of a country labourer, born in the commonest and cheapest erection of wood or mud and thatch, standing in its rood of potato-ground, have a much better chance of growing up healthy in body and mind than those who have been born under the fostering care of Urban District Councils in houses with concrete foundations, damp-proof walls, patent water-closets and traps, sewer pipes, and rain-water pipes; with an expensive paving in front, and a tiny concreted yard behind, which is practically an air-well with putrefication traps in its floor. This last class of dwelling, be it remembered, the outcome of by-laws which seem to be designed for the purpose of rapidly urbanising rural places, is very expensive, and the artisan finds that he has to pay, relatively, an enormous part of his earnings in rent and rates, and that his children have no private playground.

I freely admit that the stringent building by-laws which are now in force in many places are very necessary in crowded centres of population; and if they were still more strict on the question of height and the relation to be enforced between the cubic contents of the building and its surroundings, I for one should not object. On the other hand, it must be remembered that these by-laws very much augment the cost of building, and that it is becoming increasingly difficult to get an adequate return for houses erected for the wage-earning class. So much is this the case that it seems not unlikely that municipalities will be called upon to provide dwellings and run them at the expense of the ratepayers as a whole.

Many rural municipalities have adopted these by-laws and appear to me to enforce them very often to the detriment rather than the advantage of the locality. A little town in Hampshire, which I know well, includes within its official boundaries places which are three or four miles from the town hall, places which are in the wilds and as thinly populated as Sahara. And yet this municipality enforces its by-laws so that the farmers and gentry of these outlying spots are obliged to submit plans of even outhouses or ovens which they are proposing to erect, to the collection of tradesmen who happen to constitute the Council for the time being.

I am very strongly of opinion that the builder of an isolated dwelling ought to be allowed to escape from these harassing by-laws, and ought to be permitted greater freedom in the choice of building materials and in other matters than the speculator who is trying his hardest to put the maximum population on the minimum legal area. In relation to fire and infectious disease the surest preventive measure is the isolation of the dwelling. If the dwelling be separated from the boundaries of other premises and the public thoroughfare by a distance equal to its height (*i.e.*, the distance from the ground to the top of the highest chimney or gable) it ought to be allowed to escape from the by-laws. I need hardly say that the insurance offices will know how to enforce an adequate security against fire. Mr. Till, of Eynsford, in Kent, recently erected two timber cottages in the country on either side of a road. One of these cottages was condemned because it happened to be within the boundary of a Council which had adopted model by-laws. The only valid reason for such condemnation was the danger of fire. But it is evident that the danger of loss of *life* from fire is very slight in an isolated cottage with the bedroom windows some 10 ft. at most above the ground. On the other hand, the danger to loss of property is indicated by the fact that the insurance offices charge 2s. 6d. per cent. instead of 1s. 6d. If, however, a model by-law cottage costs 250*l.* while a wooden cottage equally large and wholesome costs 150*l.*, it is evident that the cost of insurance is equal in the two cases. The rent of the first at 5 per cent. would be 12*l.* 10s., and the rent of the second 7*l.* 10s. If the local charges (rates) be 4s. in the pound then we have as the annual cost of these two cottages:—

| Model By-law Cottage. | £ | s. | d. | Wooden Cottage. | £ | s. | d. |
|---|---|---|---|---|---|---|---|
| Rent | 12 | 10 | 0 | Rent | 7 | 10 | 0 |
| Rates | 2 | 10 | 0 | Rates | 1 | 10 | 0 |
| Insurance | 0 | 3 | 9 | Insurance | 0 | 3 | 9 |
| Total | £15 | 3 | 9 | Total | £9 | 3 | 6 |

By living in a wooden cottage the working man would save 6*l.* a year, or nearly 2s. 4d. a week. And if he have a rood of ground the produce will be worth at least 12*l.*, which will leave him with nearly 3*l.* in pocket after paying all charges on his house. Further, he will have made an intelligent use of his leisure instead of consecrating it all to beer and betting.

I need hardly say that even the isolated cottage must be under control as regards cesspools or any underground sanitary abominations, which may be an unseen danger to the neighbours, but I am very strongly of opinion that, on the grounds of the health and safety of the public, builders of isolated dwellings ought not to be harassed by by-laws, which are in their case merely a source of delay and increased expense.

I should be very happy if my remarks on this head should elicit a decided expression of opinion from an influential society such as I have the honour of addressing.

In these days of railways, trams, motor cars, telegraphs, telephones, and bicycles—machines which have practically multiplied time, and, to a great extent, annihilated space, it ought to be possible for populations to spread out and to live more decently and wholesomely than is the case in crowded cities.

It ought to be possible to build detached houses in increasing numbers, and as a consequence to give to the chief rooms of the house any aspect which may be desired.

The question of *Soil* in relation to the dwelling is necessarily one of great importance.

Assuming, in the first instance, that the soil selected is a pure soil, I may as well say that I have no evidence to bring before you that in the matter of wholesomeness there is any difference between rocks, sand, gravel, or chalk, and I am not aware that there is any evidence that either of these soils gives rise to unwholesome emanations.

The interstices of all porous soils are filled with air and a certain excess of carbonic acid, which may be considerable if there be much organic matter in the soil, and a house with lighted fires necessarily tends to aspirate the gases from the earth upon which it is built. Now I am not aware that there is any *real evidence* to show that damage has ever resulted to persons from the gases emanating from a pure soil.

In cities, where organic filth has been buried in the soil for ages, it seems likely that the gases of putrefaction may gain access to the house. In London we know that when the soil is opened up there is always a stink of illuminating gas, and, obviously, it is desirable to keep that out of our dwellings. Further, we know that impurities from sewers and cesspools are sure, under the existing order of things, to leak into the soils of populous places. Therefore, the model by-laws insist that the ground upon which a house is built shall be covered with a regulation thickness of concrete. This is a reasonable provision in a populous place, but I would remark that, so soon as a crack or pinhole is accidentally made in the concrete, the alleged security given by it vanishes. In country places which have adopted the model by-laws, the covering of pure chalk or sand or gravel with concrete is equally insisted upon before a cottage can be built. This has the effect of increasing the cost and rent of the cottage, unless it be thought advisable to make the floor of concrete finished with cement. It goes without saying that for houses built in low-lying damp situations, an impermeable layer of concrete is necessary. The above remarks are intended to apply to concrete as a barrier against the gases in dry soils.

The soil upon which a house is built influences the comfort and therefore the health of the indwellers. On a dry soil it is possible to take exercise in comfort, while on stiff clay soils walking or any other exercise in the winter months is a disagreeable and dirty proceeding.

It is quite possible to build a house upon clay which shall be perfectly dry, and through clay unwholesome gases find it difficult to travel, which is a theoretical advantage. Fogs are frequent on clay lands, but it is not clear that an occasional pure fog does any harm to a healthy person. I say nothing of the foul irritating fogs of London, which are dangerous to many and deadly to not a few.

The nature of the soil upon which a house is built has great influence on the ease with which the waste drainage waters are got rid of. On porous soils—such as sand, gravel, and many chalks—they soak away, and hence there has been a great temptation on such soils to construct soak-away cesspools, which in the days of our ancestors, before the use of water-closets and fixed baths, or even daily "tubs" became general, were little likely to contain infective matter, and continued to act efficiently for years. Modern sanitation has raised the amount of waste water enormously, and the invention of the water-closet has greatly increased the danger and foulness of the waste waters. It is probable that the amount of sewage to be dealt with in country houses, has, in modern times, as compared with the last century, been multiplied by ten, and it is now quite common for the owner of a biggish country house with stables to have to grapple with 1,000 gallons of sewage per diem, or 160 cubic ft., an amount which will stand about an inch high on an area measuring 50 ft. in length and 40 ft. wide, or which, in a month, will fill a water-tight cesspool measuring 24 ft. by 20 ft. and 10 ft. deep—the dimensions of a fine dining-room—and which, when full, will contain more than 130 tons of foul liquid, which will all have to be raised and distributed. On a porous soil such an amount of fluid, if delivered on the surface of the ground, may be got rid of with ease and without offence, if the few pounds weight of excreta (12 lbs. at the outside) of the twenty-five people living in one country house be dealt with separately.

On a clay soil, especially in winter, a very much larger area of ground must be used for the waste water.

The foulness of the River Brent, of which we have heard so much, is probably due to the fact that the foul liquids on the clay soil through which it flows, tend to run off the surface instead of percolating through the soil and thereby becoming purified.

I must not pursue this subject further, as it is not my intention to discuss the question of slop-drainage and sewage treatment, which I have dealt with at length in my little book "The Dwelling House." I will merely add that, whether a house be on a permeable or impermeable soil:—

1. All waste fluids should be dealt with before putrefaction sets in.
2. They should be delivered on to the surface and not beneath the surface of the ground.
3. They should never be allowed to collect in cesspools which encourage putrefaction, and merely postpone the inevitable work of distributing them over the ground.

My paper is illustrated by a few simple diagrams which almost explain themselves.

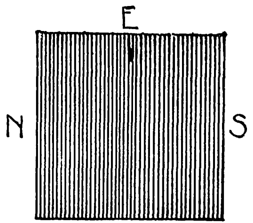


FIG:1

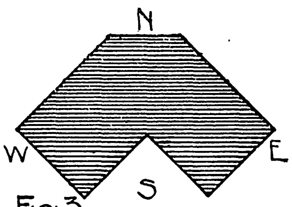

FIG:3

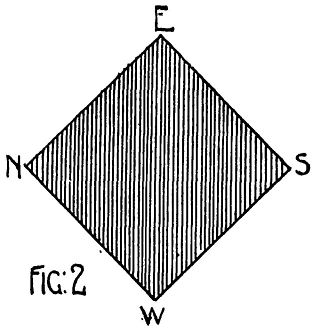

FIG:2

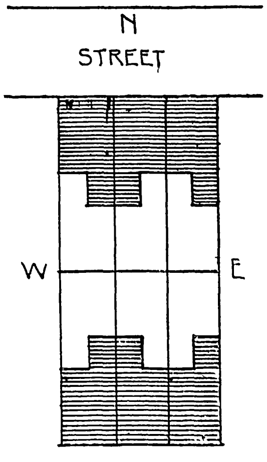

FIG:4 S

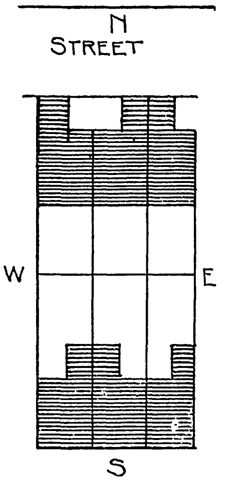

FIG:5 STREET

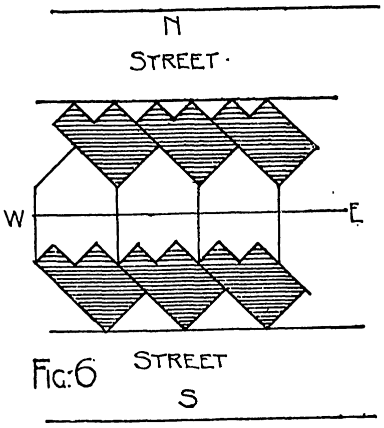

FIG:6

Figs. 1 and 2 represent a square house, having sides and angles respectively presented to the cardinal points. In fig. 1 the side N. would only receive an average of two hours' sun for six months in the year, whereas the sides N.E. and N.W. in fig. 2 would receive sun on every day except for a short time at the winter solstice.

Fig. 3 represents an idea of the author's for an invalid's bungalow, with a glazed verandah falling due south.

Figs. 4 and 5 represent six houses with the fronts all facing the street (in fig. 4), and with the backs of three facing the street (in fig. 5).

Fig. 6 represents the arrangement of houses obliquely and *en échelon*, so that the main living rooms in all of them may look to the south-east. These six houses occupy approximately the same area as those shown in figs. 4 and 5.

---

The Chairman, in opening the discussion, said that they could all truthfully say that the last paper of the session had not been the least interesting. Dr. Poore had given them a most useful and scientific paper, and they were especially glad in getting his experience from a medical point of view—a point of view that they wanted such subjects treated from. Dr. Poore had alluded to the increase of the so-called tower flats as one of the things which, to a certain extent, was destroying home life among the working classes. That, in his (the Chairman's) opinion, was one of the greatest evils of those flats. The children were shut up in little cemented areas—worse than prison areas—and their white pasty faces bore evidence of being shut up in such places, breathing the poisonous gases which had been alluded to. In reference to the evil effect of these tower flats, one saw the same thing going on in America, where flats were carried up such an enormous height. The hotel life and the flat life in America seemed to be disintegrating real home life. There was no such thing as home life in America—that is in the way in which it existed in England or Germany—at all events, it was not a national thing. Germany and England were far above America in that respect, and he hoped that nothing would be done to destroy the English home life, though such a tendency was, unfortunately, noticeable amongst the working classes. Another matter for regret was that, in consequence of the degraded state in which many of our mechanics have got, they appeared to be absolutely indifferent to the beautiful; they seemed to have settled down to that sort of life, as though there was nothing better for them. Looking at the matter socially, it was a great evil, quite independently of health. As to Dr. Poore's figures as to the death rate of children, they made one realise that town children have a poor chance compared with country children; one saw it in the faces and the physique, and eventually it must be seen in the mind. As to the evils of the impurities of coal gas, faulty pipes were one of the greatest evils which we in London have to deal with. One could go into house after house and find faulty pipes under floors or in bedrooms; people did not get actually ill, but there was a sort of lassitude about them and they could not tell why; it was simply and solely due to the escape of this impure gas—not sewer gas, but simply illuminating gas.

A letter on the subject had been received by the Committee from Mr. Ambrose M. Poynter, who stated that had he been present he could have done little more than say "ditto" to Dr. Poore. There were two points in particular in regard to Dr. Poore's writings and investigations which seemed worthy of attention. One was the extreme undesirability of taking things for granted, or pinning one's faith on any system without satisfying one's own understanding, as far as one was able, how far it was based upon reason and good sense. Were we to listen to the voice of sanitary authorities, engineers, and experts, we should believe that all was for the best in the best of possible cities. Dr. Poore, at all events, had been unwilling to take things for granted, and the conclusions Dr. Poore had come to and the facts he had pointed out must give pause to even the blindest optimist. The second point was the extreme harm done to the well-being of rural and semi-rural districts—to say nothing of the art of architecture, which was quite pushed to the wall in the struggle—by the application to them of by-laws based on the Local Government Model Act. The chief aim of the Model was, he took it, to mitigate some of the evils of overcrowding in big towns; the application of its provisions undiluted, to rural districts, very naturally created in them a state of things which was a facsimile of all the evils we should be most anxious to avoid. It was almost incredible, but a study of the local building by-laws of many districts in the south of England showed that in every instance the laws for country towns and districts are severer than they are in London. In London buildings of certain size, situated at a certain distance from their neighbour's land and the public way, were exempt from those parts of the Act (Parts VI. and VII.) which related to construction. In no country Act that he had seen was this exemption granted. What were the effects of applying these conditions to rural districts, Dr. Poore had shown. How the art of architecture suffered from these unnecessary restrictions they could imagine. He felt that all architects should bond together and try and obtain a reasonable elasticity in the administration of these laws, and on the part of the Local Government Board a reasonable measure of intelligence in ensuring that the laws submitted to them for sanction were suited to the character of the districts for which they are destined. As regarded the sanitary effect of these laws, it could not be too clearly remembered, with regard to the building regulations which affect the thickness of walls, extent of curtilages, and other provisions which aim at securing substantial building and free circulation of air, that the legal minimum became the habitual maximum.

Mr. Till referred to the inconsistency of some local by-laws. At Eynsford, a few feet over the parish boundary, they had been permitted by the laws of one authority to build a wooden bungalow cottage of four rooms, but immediately the footings of a second similar cottage were in, 20 ft. distant, the local inspector reported contravention of the by-laws. They approached the Local Authority, who advised a memorial to the Local Government Board. The Local Authority expressed their sympathy with the objects of the memorial, and the matter had since been under the consideration of the Local Government Board. Houses were desperately needed, and he felt that a cottager ought not to pay more than one day's wage per week for rental. In his district, such was the dearth of houses for the labouring classes that two and more families had to inhabit the same house—and that, too, where agricultural land could be had for 10s. per acre. What was needed in rural districts was a bungalow cottage with four or five rooms, the cost of which should not exceed £100. What they were trying to do in his district was to obtain from the Local Government Board power to build isolated bungalow cottages of wood, with all necessary attention to sanitary requirements. They insisted that at the present price of material and labour they could not build houses the rent of which would permit labourers to inhabit them — that was if all the requirements of the Local Government Board were acted upon. They would build a suitable house for 100*l*., but if they adopted the by-laws it would ordinarily cost 200*l*. In rural districts the application of the urban by-laws practically stopped cottage building, and, where the population increased, people overcrowded, and there was no privacy for the family at all. There were no gardens, too, and in some rural districts the overcrowding was almost as bad as it is in London. He hoped that the Association would do all they could to show the Local Government Board that there is no necessity for the hard and fast laws which they had laid down, and which stopped the supply of cottages for rural labourers. He had suggested that the Local Government Board should make practically only one condition where they allowed a labourer's bungalow cottage to be built, viz., that it should be on a site of not less than one-eighth of an acre. That was about the size of an ordinary allotment, and if that were done they would ensure the building being properly isolated, and they would get the garden also.

Mr. F. T. W. Goldsmith, in seconding the vote of thanks, said that in the parish of Chislehurst an agitation was on foot to endeavour to get precisely the same conditions with regard to building artisans' dwellings that Dr. Poore had suggested and which Mr. Till had advocated. At Chislehurst the regulations made it practically impossible for any person to build workmen's cottages and get anything like a reasonable return for his money; and the Chislehurst authorities appointed a Committee to inquire how the by-laws could be modified. They had not reported, and it appeared that they were waiting for the Report of the Committee of the Royal Institute of British Architects, which was now dealing with the question. He should like to know how Dr. Poore arrived at his values with regard to the non-rural District Council cottage and the rural District Council cottage. A dwelling built according to a District Council's regulations would cost, according to Dr. Poore, 250*l*., and one of equal accommodation, and equally satisfactory, but not built according to those by-laws, would cost 150*l*. Several people he (the speaker) had spoken to on the subject thought that such a reduction as that was impossible, even if wood were substituted for brick and the party walls and footings were omitted. That was so, at all events, in regard to one part of Kent. As to Mr. Till's remarks, he (the speaker) thought it was far better that country labourers should live in small bungalow cottages, separated from each other by a space equal to the height of the house, instead of in those of the horrible regulation pattern. Cottages had to be made to pay, and Mr. Till had shown how this could be done where the District Council by-laws could be ignored. Workmen's cottages could not be built in compliance with the local requirements and yet be remunerative. He hoped that one result of Dr. Poore's paper would be that a set of by-laws would be obtained which could reasonably be applied to such buildings. He should like to know if Dr. Poore found that in the neighbourhood of large towns the earth-closet system was applicable to any large extent.

Mr. Swinfen Harris said that the great agricultural industry of England would soon be relegated to Normandy and Brittany unless something could be done to keep the farm labourer on the land, and one means of doing that was to provide him with a good homestead. Cheap things were nearly always nasty, and good homesteads could not be built cheaply. Wooden houses, well built, were not cheap. As to the question of aspect *v.* prospect, his experience was if there happened to be a beautiful view looking to the north or north-west, facing that his client would insist on having the drawing-room window, contrary to the architect's advice and plans. In fact, he (the speaker) usually made two sets of plans in such circumstances, for only one of which he got paid. Professor Kerr had written some excellent advice on the subject of aspect *v.* prospect, but, judging from the number of plans to be seen in the professional journals, he was afraid that the advice was not often acted upon. Another weakness in a good many modern houses was in regard to the position of the scullery and the larder. Very often the only approach to the larder was through the scullery—a most execrable arrangement. Every larder should be approached from the cool side of the kitchen or have a lobby outside, so as to keep it away from the smells of the scullery. In reference to the offices having a north aspect, he was quite in sympathy with that, but where there were servants who had to be humoured if they were to be kept, a servants' hall had to be provided, with a sunny aspect if possible. As to Dr. Poore's remarks in reference to the contamination of bath water with fœcal matter, he advised them, if they had a garden, never to let the bath waste go into the cesspool. It was very suitable for watering rose-trees round (*i.e.*, not *on*) the roots.

Mr. W. H. Bonner Hopkins said that the question very much resolved itself into the question of what open spaces should be possible about buildings. For without ample space it was not possible to place houses with the best aspect. The amount of open space which it was possible to give to houses depended ultimately on the original cost of the freehold land. He considered that the freeholder of land upon which houses were proposed to be built should be considered a public benefactor when he refused to put a price upon his land that made it impossible to leave an ample space about such buildings. He looked upon the system of building houses upon leasehold ground as the system which offered the best guarantee, in the hands of a large-minded and public-spirited owner, against overcrowding. And such landowner would have his reward, for in addition to the benefit to the public of ample space, there was substantial benefit to the ground landlord and the house-owner, for houses with ample space about them would never stand unlet (other things being equal), and those crowded and badly-situated would be deserted for houses at a greater distance from centres of population which had not yet become surrounded by other buildings. Dr. Poore's remarks as to turning backs of houses to the streets were worthy of attention; but there was the difficulty that if the houses were always to have their living rooms to the sun then they must sometimes have the noise and dirt of the street. There could be little difficulty in making the elevation of the dwelling rooms and that of the offices equally presentable, so that either could be turned to the street. Granted that this could be done, it would surely be best to have most of the living rooms facing a spacious garden at the back as was now done in the south-west of London, notably at Harrington Gardens, and at the same time facing south or some point south of the east and west axes. Both these conditions could be effected by having three quarter squares. [Mr. Hopkins then illustrated his idea on the blackboard.] As to a too rectangular lay out, there was much to be said *primâ facie* against it when the streets were narrow, all the houses alike, all ugly, and all with the minimum open space allowed by the by-laws. On the other hand, in civilised times it was not only natural but more satisfactory from both practical and artistic reasons to have a geometrical lay out and such could surely be done so as to look well, as by the use of straight lines, squares and polygons, regular curves, such as quadrants, crescents, circuses, ovals, and so on, in conjunction with ample open space, such space being necessary to avoid all bareness of this geometrical laying out by means of a judicious planting of trees and creepers, and by the natural diversity of the buildings or groups of buildings. As to the Local Government Model By-laws they were drawn up with a view to cope with the evils of existing overcrowded areas, and in that connexion they had, doubtless, been very beneficial, but when applied to new areas they were monstrously foolish. Could not something be done to have two codes of by-laws—one on the old lines for existing over-built areas, and one on far more beneficial and healthy lines for areas not yet built upon? With regard to the Model By-laws of the Local Government Board, he would draw attention to the fact that though drawn up and issued about seventeen years ago (he spoke of building by-laws), they had never yet been revised. When they thought of the immense advance which sanitary science had made during this period, he considered it nothing less than a disgrace that those Model By-laws had not been modified and brought up to date. He thought this was a point which demanded the serious attention of all public-spirited men, and that a body of public opinion ought to be formed, and pressure ought to be brought to bear in the proper quarters to remedy this scandalous evil. He heartily sympathised with Dr. Poore's suggestion that there ought to be some provision in the by-laws, or some elasticity of application whereby large open spaces should be encouraged. It only too often happened that new by-laws were drawn up by Urban Councils, the members of which Councils were in great part wholly unfitted for the task. With regard to soil in relation to house sites, he noticed that Dr. Poore did not include clay as a wholesome soil on which to build. It was productive of fog, but Dr. Poore did not emphasise the fact sufficiently. If fog was pure, and therefore not unwholesome to the body when taken in moderate doses, yet it was chilling and rheumatic, and had a most depressing effect on the mind. In addition to the evil of fog resulting from a clay soil, such a soil was most unsatisfactory as a foundation if at all on a slope, for it was then a constant and incurable source of settlements in buildings.

Mr. W. H. Seth-Smith said that in reference to the death rate of children under five years of age, it made a great difference whether or not the children were sent into the country or the seaside occasionally. It was satisfactory to know that owing to developing railway systems and the lower charges made for travelling, artisans were being encouraged to live out of London, at places like Ilford and Walthamstow. No doubt the movement would be very much developed. As to soils, clay was a good soil in preventing the percolation of gases and moisture on a contaminated site. He should like to know if Dr. Poore had formed an opinion as to how far cement-concrete could be relied on to prevent percolation. He had great doubts whether the regulations of the authorities were much of a safeguard in that respect. They all knew how careful they had to be in the case of sewage-contaminated gravel.

Mr. H. A. Satchell said that architects could do something to improve a dwelling house, set out at right angles to the road, by introducing a bay window. There were few cases where this could not be done, and where it was done, the occupants of the house had a choice of three aspects, and if the sun did not enter from the front it would from the sides. One always imagined that soil had a lot to do with health. As to the concrete floor being wholesome, he thought the chief objection to it was its coldness, and that wood blocks were more suitable. As to escaping gas, that was a very important matter, and it had occurred to him that in some respects it was a misfortune that gas was so well filtered, for it was then not so easily detected when it escaped through defective joints. As to bath water being turned on to land, it was generally thought best to flush the drains with such water. The two gallons from the closet cistern were not sufficient. As to a verandah, its provision was a luxury, especially in the country; but in towns it was often a great nuisance. In London, for instance, there were a certain number of days of gloom and depression and fog, which the verandah increased rather than lessened. It kept out the sun when it was wanted badly, and compared with that the advantage was very slight of keeping out the sun on the few days when it was not wanted.

Mr. Maule said that he had recently to make a report on some cottage property in Dorsetshire and Wiltshire, and in many instances he was told that the existing cottages were so defective that the farm labourers would not live in them, and as it did not pay to put up new cottages under the Local Government by-laws, the labourers were being driven to the towns. If those by-laws could be altered it would be an extremely good thing for the country at large. It was, doubtless, to a large extent in consequence of those by-laws that there was so much overcrowding, for the cost of building new cottages was such that the farm labourers could not afford to pay the rent that was necessarily charged for the landowners to get a fair return on the outlay. The by-laws were well enough in towns, but on estates or in small villages they were absurd.

The Chairman said that Dr. Poore had sent the Association a resolution, which he would like them to pass, stating that as the overcrowding was acknowledged to be a great cause of sanitary and moral evil, it is desirable to encourage the building of isolated cottage property. He (the Chairman) thought that Dr. Poore's interests would be better served by letting the Royal Institute of British Architects, who has the matter in hand, carry it through. The Association would be quite willing to pass such a resolution, but it was thought best to leave it to the Institute.

Mr. Arthur S. Flower said that the report of the Institute Committee was in print, and was now being considered by the Council, and in a few weeks it would be made public. The report goes thoroughly into the matter of all the by-laws.

The vote of thanks was then put and carried very heartily.

Dr. Poore, in reply, said that it was evident that on the main issues they were all agreed, and he was glad that the Association agreed that more freedom was necessary in building in rural districts. We are getting very much under the thumb of the half-educated class in this country; we are getting too much under the thumb of the sanitary inspector and the police. He was nearly sixty years of age, and yet he had never stood in the dock! Later on few would be able to say that. As to his estimate of the cost of cottages, he had arrived at his figures by inquiry, but he put them forward cautiously. The figures might be wrong, but still the principle would be the same; and in considering the cost of a cottage they must not forget the cost of submitting plans to the authorities and the usual delay, &c. As to the earth system, he was strongly in favour of it in the country, but he felt, as they all must feel, the enormous convenience of the water-closet in towns. We are getting dangerously squeamish on that matter, he felt; things were much simplified if fœcal matter could be dealt with on the earth, day by day; it simplified the drainage question, and it was worth considering. In his garden he dealt with the sewage of about twenty cottages, and he had done so for about sixteen years, and he had never had any trouble in the matter. The stuff was removed and buried every day. The size of the garden was 1 acre 1 rood and 7 perches, and the produce of the garden yielded 71*l.* 19s. 6d. last year. Thus there was a saving, in that there were no drains, no patent machinery, while there was the gain from the produce of the land. In Holland there were no water-closets—at least, in the part he was familiar with—for the country was on a dead level, and if water-closets were provided, Holland would become uninhabitable. And yet the country was quite healthy, and there had been the same reduction in deaths from enteric fever as with us. In the town of Groningen, with 63,000 inhabitants, there was not a water-closet in the place, and the whole of the excreta were removed two or three times a week, or oftener if people liked to pay for it. That place was the cleanest town he had ever seen, and the total cost of cleaning it was 90,000 florins per annum, while the excreta were sold to the farmer, realising 60,000 florins, with the result that the cleansing of Groningen was done for about 10d. a head. In England we are chucking our money by hatfuls down the sewer. Of course, in a crowded town like London we are doing the only possible thing, but in the country the excreta ought to be returned to the soil. The Dutchman had grasped the great principle that whatever was taken out of the soil must be returned to it, and with the most astonishing results in the way of exports of farm produce to this country. We have learnt our relationship to the air and the water, but we have yet to learn our relationship to the earth. In his own house he would not think of having sewer, or cesspool, or water-closet, and he would not live in a house with one if he could help it, for he knew so well the evils of putrefaction. As to Mr. Hopkins' criticisms of his curves of beauty, he admired as places of business shops like those in the Quadrant in Regent-street, and he should be glad if they were copied; but out of town, in a place where rest and recreation were sought, it was an important thing to get variety, and "these Chicagos" which were put up in the suburbs, looking like so many chess-boards on plan, had no variety. The variety he admired was to be seen in old village streets, built without by-laws, and which showed lines of beauty and variety. It was an important matter to get people out of town, and doubtless facilities for doing so would increase. As to concrete, it wanted watching when it was laid. Holes could be stopped by putting in cement, and it was then our own fault if they left holes for the gas to get through. In villages there were often no pavements, and earth gases and vapours had a chance of escaping anywhere; but in towns the pavements kept the gases in, and those gases escaped into the house. As to the effect of soil upon health, there was very little reliable evidence, though there was one disease which was undoubtedly influenced by local conditions, viz., spasmodic asthma.

### *Election of Officers for 1899-1900 and Votes of Thanks.*

The announcement of the election of officers for session 1899-1900 was then made.

Mr. J. W. Stonhold having raised some questions in regard to the election, which were answered by the Chairman, the following list of those elected was read:—

*President.*—Mr. G. H. Fellowes Prynne. *Vice-Presidents.*—Messrs. E. Howley Sim and H. T. Hare. *Committee.*—Messrs. B. Pite, W. A. Pite, P. J. Marvin, A. H. Hart, F. G. F. Hooper, H. A. Satchell, M. Garbutt, W. A. Forsyth, W. H. Seth-Smith, A. Bolton. *Hon. Treasurer.*—Mr. Hampden W. Pratt. *Hon. Librarian.*—Mr. A. S. Flower. *Hon. Secretaries.*—Messrs. G. B. Carvill and R. S. Balfour. The above form the Committee. Other officers:—Hon. Solicitor, Mr. W. H. Jamieson; Hon. Assistant Librarian, Mr. W. B. Dukes; Hon. Auditors, Messrs. J. W. Stonhold and W. E. Davis; Assistant Secretary and Registrar, Mr. D. G. Driver.

On the motion of Mr. G. B. Carvill a vote of thanks was accorded to the scrutineers, Messrs. W. A. Webb, A. Smithers, and W. A. Jeckells.

Mr. J. Osborne Smith proposed a vote of thanks to the President, Vice-Presidents, and members of the Committee. He was very pleased to know that Mr. Prynne had been re-elected President.

Mr. Swinfen Harris seconded the motion, which was agreed to.

Mr. W. H. Seth-Smith then proposed a vote of thanks to the Hon. Treasurer, Mr. H. W. Pratt. He also coupled with it thanks to the Librarian and the Assistant Librarian for their valuable services.

Mr. Goldsmith seconded, and the motion was agreed to.

On the motion of Mr. Beresford Pite, seconded by Mr. Satchell, a vote of thanks was heartily accorded to the Hon. Secretaries, Messrs. E. Howley Sim and G. B. Carvill, and to the Assistant Secretary and Registrar, Mr. D. G. Driver.

The following votes of thanks were also passed:—To the Institute, for the use of the Meeting-room; to the School of Design Visitors; and the Education Board, for facilities granted in connexion with workshop demonstrations.

The meeting then terminated.

## THE SURVEYORS' INSTITUTION:

### LAND PURCHASE IN IRELAND.

AN ordinary general meeting of this Institution was held on Monday in the temporary premises of the Institution, Savoy-street, Victoria Embankment, Mr. Robert Vigers, President, in the chair.

The minutes of last meeting having been read and confirmed, Mr. R. M. D. Sanders read a paper on "Land Purchase in Ireland." In the course of his remarks he said that the system of land tenure in Ireland, inaugurated by Mr. Gladstone in 1881, and perpetuated by the Land Act, 1896, had very few friends. Representatives of landlords and tenants alike condemned it. The economic loss to Ireland which it caused was very great. In July, 1895, Mr. Gerald Balfour gave a forecast of the Government policy in regard to Irish land, declaring that in his judgment the alternative solution of the difficulties would lie, not in any amendment of the Act of 1881, but rather in promoting the more rapid and effective working of the Land Purchase Acts of 1885 and 1891. But, unfortunately, Mr. Balfour's Land Act, 1896, aggravated the evils of the rent fixing system, which tended to discourage the tenants from adopting land purchase as a settlement. The administration of this Act necessitated the appointment of the Royal Commission, presided over by Mr. Justice Fry. That Commission issued a most valuable report, and it was to be regretted that the recommendations contained in it had not been fully carried out by the Government. A great social revolution had just been passing over Ireland with the establishment of Local Government. The landlords as a class had been relieved of their former local duties, and very great and far-reaching powers had been placed in the hands of the people. The importance of creating a strong and numerous body of peasant occupiers was increased, and the object of his paper was to consider how this could be encouraged. Compulsory purchase was not only undesirable but unnecessary, because we want to get back to the principles of "free contract." The basis of a voluntary system of purchase was "free contract," but compulsory purchase or sale must be founded upon an official valuation, which would not satisfy all parties nor would the State have the same security for the repayment of advances as under the voluntary system. He thought also that more rapid progress would be made by improving the present methods than by experimenting afresh. The Purchase Act of 1885 enabled the Land Commission to advance the whole of the purchase-money to the tenant keeping back one-fifth from the landlord as a guarantee deposit, upon which he received 3 per cent. interest and repayment of the cash at the end of about seventeen years, if there were no deductions to be made for purchaser's defaults in repayment of the instalments. The loans were made at 4 per cent., repaying principal and interest in 49 years. The advantages obtained induced many tenants to purchase, and ten million pounds were advanced in about six years, converting into owners 25,000 occupiers of 1,000,000 acres, who previously paid a rental of about 600,000*l.* per annum. In 1891, the system having passed the experimental stage, and the authorised direct grants from the Treasury having been used up, the Purchase of Land (Ireland) Act, 1891, became law, enabling the Land Commission to issue stock at 2¾ per cent. to the amount of 30,000,000*l.* The conditions attached to advances were not so favourable to the tenant purchasers as previously, and amendments improving these were enacted in 1896, which had now made the terms more acceptable. The landlord who sells receives payment in stock which now realises in cash 10 per cent. premium. Up to the end of the last financial year, land stock to the amount of 3,178,000*l.* had been issued, and 9,580 occupiers, who paid a rental of 190,000*l.*, were converted into owners under this new procedure.

It would be observed that steady progress was being made in this process of land purchase, and that land to the value of nearly 800,000*l.* per annum had been transferred to the occupiers. There were about half a million agricultural holdings, the total agricultural rental of Ireland was about 10,000,000*l.* a year, paid by half a million occupiers, three-fourths of whom paid less than 15*l.* per annum, but only occupied about a quarter of the agricultural land, and about a quarter of a million were less than fifteen acres. As half the 30,000,000*l.* available for land purchase must be applied for the purposes of small holdings, there was ample money available to deal with a very large proportion of occupiers. The advantages of the system to both landlord and tenant were very great. The tenant becomes fee simple owner subject to a terminable Government annuity which was very much less than his rent even when he agreed to pay his landlord a liberal price, and was reduced every ten years in proportion to the amount of principal paid off. The author then described the financial details as to purchase and repayment. Proceeding, he said that some change was necessary, and an extension of land purchase rather than a continuance of the present statutory rent-fixing system was apparently the policy of the Government. They could bring it about without any grand heroic measure of compulsory sale, but rather by the removal of the difficulties which now stood in the way of voluntary agreements. It was worthy of comment that out of thirteen millions which had already been advanced for land purchase default had taken place in very few cases, and the guarantee deposit in 999 cases out of 1,000 had never been drawn upon. The price which the tenant gave to his landlord was never the full value of his holding, and there was generally a large tenant right often exceeding that price which the Land Commission had as additional security. But the real block lies in the system of transfer of the land to the tenants. The Land Commission have a large staff engaged at the work, and they have been unable to vest on the average more than one million pounds' worth of property each year. At that rate it will take perhaps twenty-six years to use up the funds provided by the Land Purchase Act of 1891. What was the remedy? He believed it lies in establishing a proper system of registration of title under which the transfer of land in large or small parcels may be effected as rapidly and inexpensively as it can be in the colonies and on the Continent. The necessity for adopting registration of title in the case of peasant proprietors as a protection to the State in securing the advances made was admitted by the passing of the Local Registration of Title Act, 1891. Although this Act falls far short of what is required, it nevertheless creates a new system of transfer which can easily be developed to meet the requirements of the country. The Act creates two systems of registration: (*a*) Compulsory registration in the case of all tenant purchasers; and (*b*) Voluntary registration for any other landowner who desires to bring himself under the Act. When an estate had been registered, the title to it having previously been investigated by the Government office, sale and transfer was the simplest transaction possible. The landowner, in lieu of his title deeds, became possessed of a certificate of title which was good against all the world. If he desired to sell to his tenants under the Purchase Act, he had merely to produce his certificate and a sale could be made so soon as the farms had been valued and the advances provisionally sanctioned.

He was strongly of opinion that the ultimate success of land purchase would depend upon the improvement of this system, which, to be perfect, must comply with the following conditions:—1. It must be compulsory in all cases. 2. It must be founded upon an accurate survey officially prepared, and the boundaries between occupations must be made conclusive.

The perfecting of a good system of maps was of very great importance. There were at present mapping departments attached to the Land Commission. The Valuation Office, the Land Judges Court, and the Local Registration of Title Office. These should all be united under the Ordnance Survey Department, and the saving of expense to the State would be sufficient to enable that Department to produce a map of any district in Ireland with correct boundaries between the occupations. Public notice might be given that, after a certain period, the boundaries set out on the map would be deemed conclusive. There would be very few changes made, for the occupiers were only too ready to accept the ordnance map when disputes arise over their boundaries. When this mapping system had been completed for any area, and the title to an estate within that area had been cleared, it would be registered with a schedule of tenancies and reference numbers to the map, similar to a well made out estate map, and a transfer of ownership could be effected in a few days.

### *Professional Examinations, 1899.*

The following student candidates have passed the examination for the Professional Associateship:—R. W. Alderson, Leek Wooton, Warwick; J. W. W. Armstrong, Stratford-on-Avon; E. W. Booth, Morley; † A. G. Bradshaw, Lancaster; C. J. B. Bridgewater, London; B. V. Bruton, London; G. R. Church, South Hampstead, N.W.; G. H. Cole, Chelsea, S.W.; G. E. Cragg, Kendal; G. H. Croft, Brighton; G. A. Cutler, Blackheath, S.E.; H. Dann, Jun., Gravesend; J. W. S. H. Davies, London; *H. A. A. Gate, London; H. A. Gleed, London; J. C. Goff, Kingstown, Co. Dublin; A. Goodman, Upper Clapton, N.E.; R. G. Gurney, Aylesbury; J. S. Hall, Muswell Hill, N.: T. P. Hartley, West Hampstead, N.W.; L. G. Hawkins, Downham Market; E. R. Hinchsliff, Crewe; M. A. Hindmarsh, Alnwick; G. Howland, Coleshill, Amersham, Bucks; P. Hurlbutt, Flintshire, North Wales; G. P. Knowles, London; N. P. Laird, Kirby Muxloe, near Leicester; S. M. Lampard, Clapton Common, N.; H. ### SOUTH HALL, BRANKSEA CASTLE, POOLE, DORSETSHIRE.

THE drawing shows an apartment in the castle, known as the South Hall. The vaulted portion, about 24 ft. square, is enclosed within the limits of the ancient keep, the walls of which on either side are over 9 ft. thick. The history of the castle and of the beautiful island in Poole Harbour on which it stands, is not without interest. In A.D. 1015 King Knut and his Danes landed there, and Roman remains have also been discovered, including a very beautiful marble bath out of a single block, with a finely-wrought fluted pattern on the outside. This bath has now been brought into use in one of the bath-rooms in the restored building.

The castle was built about 1545, and attained a position of considerable importance as a fortress during the Civil War, until, in 1722, it ceased to be a fortified stronghold. Its hospitality has been extended to many illustrious personages in days gone by. In 1665 Charles II. and the Duke of Monmouth, attended by a great retinue, journeyed there by water and spent a night. In 1741 Frederick Prince of Wales went there, and George IV. is also numbered among its guests. The castle has had many

owners, among them the notorious Colonel Waugh. It is now the seat of Captain K. R. Balfour, 1st Royal Dragoons. On the afternoon of January 26, 1896, fire was found to have broken out in the billiard-room, which occupied the top floor of the tower, and in the course of a few hours the whole of the structure, including the famous carved oak staircase and elaborate panelling, was totally destroyed, the outer walls alone remaining.

The castle has now been completely restored and added to, though the internal arrangements have been largely modified to suit present-day requirements. The arcade seen in the drawing now carries the south wall of the tower, which it was found necessary to rebuild during the reconstruction, and by this means sufficient amount of daylight is now obtained in the inner portion of the room. The interior walls are now hung with a red and yellow silk brocade of fine design, which contrasts well with the fine old tiles which form the fireplace.

Previous to the fire many of the ceilings were elaborately frescoed by Italian painters, and it has been intended to reproduce something of the same kind on the new plaster ceiling of the South Hall.

R. S. BALFOUR.

## NEW CHURCH, GLASS HOUGHTON, CASTLEFORD.

THIS church is designed to accommodate 600, and for an elevated corner site. It is to be built of thin local bricks with stone tracery for the windows, &c. The roofs are to be covered with best Westmoreland slates and lead.

Messrs. Demaine & Brierley are the architects.

## NEW CHURCH, PARISH OF ST. THOMAS, YORK.

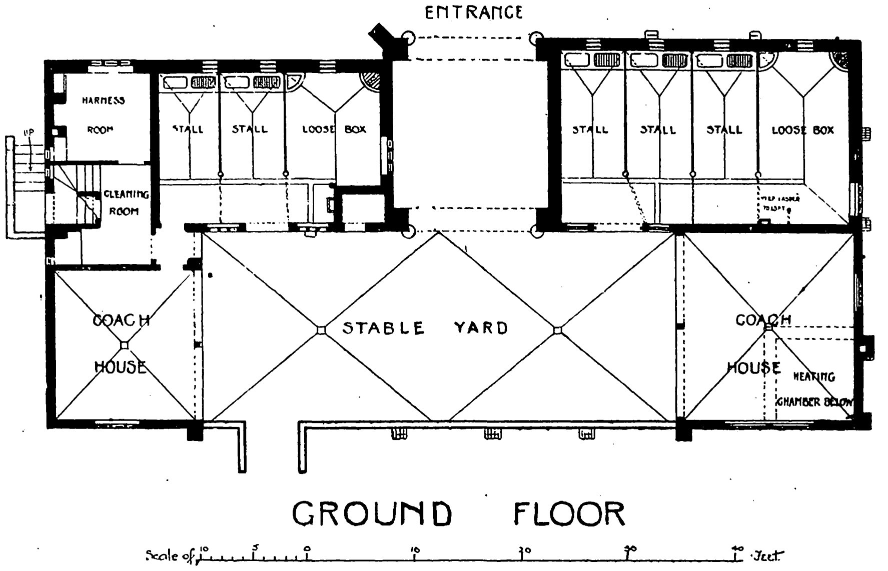
THE plan attached to the drawing will explain the arrangement of this church, which is planned to accommodate 700 worshippers and to be built in sections. The choir and choir aisles are to be built first, and will accommodate 300.

The turret staircases are for access to the organ chamber, which is over the south aisle, and to the screens and roofs. The one on the north side is also carried up as a bell turret.

The materials proposed to be used are thin hand-made red bricks with stone dressings. The aisle and vestry roofs are to be covered with lead and the others with green Westmoreland slates. Inside the walls will be plastered, with panelled wood dado.

Messrs. Demaine & Brierley are the architects.

## STABLES, LINGFIELD.



*Stables, Lingfield. Plan.*

THESE stables were erected in two sections. The portion to the left of archway shown in the view was erected as a stable complete in itself, and shortly afterwards the additional coach-house and stable accommodation was added. This accounts for the stable being divided into two sections.

The materials used are red brick for the lower portion, rough timbering and plaster for the upper part, and tiles for the roof, with local stone used for the dressings, &c., to archway.

Mr. Ernest Runtz is the architect.

## THE CROWN THEATRE, PECKHAM.

WE give the perspective view and two plans of this theatre, recently erected from the designs of Mr. Ernest Runtz.

The main entrance to the stalls is in the High-street, as also the pit entrance; the amphitheatre and gallery have entrances from Stafford-street.

The auditorium is divided up into an area and two tiers, and whilst the area floor is divided into the stalls and the pit, the first tier is known as the grand circle and balcony, and the second tier as amphitheatre and gallery. The total accommodation afforded is approximately for an audience of 2,600.

In the auditorium the proscenium has a frieze in which is a central group representing Britannia, with figures of Scotland and Ireland; a group representing Poetry, Music and Dancing, and another representing Literature, Art and Science.

The stalls saloon is decorated with some Flemish wood carving, with a display of old armour, halberds, antlers, &c. The saloon attached to the first tier is decorated in Renaissance style, with furniture of the Sheraton type. The lounge connected with this is ornamented with a fountain.

The stage, as will be observed, is unusually wide, for purposes of spectacular effect.

The theatre is lighted by electric light, and exhaust fans have been introduced for ventilation; the heating being by a low-pressure hot-water system.

The general contractors were Messrs. Colls & Sons. The decorative paintings were executed by Mr. Charles Buchel. Other works in the building were carried out by the following firms:—Constructional ironwork, Messrs. Dennett & Ingle; terra cotta work, Messrs. Doulton & Co.; electrical installation, Messrs. Strode & Co.; plastic decoration, Messrs. G. Jackson & Sons; furnishing and general equipment, Messrs. Wolfe & Hollander; stage appliances, Mr. I. N. Lyons and Mr. J. Cawdry; fire hydrants, Messrs. Merryweather & Son; "fire-proof" curtains and doors, Messrs. E. & E. Taylor; vitreous mosaic work, Messrs. Jesse Rust & Co.; brass work, Messrs. Carter & Aynsley; panelling and antique furniture, Messrs. Lennard & Son; bamboo work, the Fisher Bamboo Company; wall paper, Messrs. Chappell & Payne and Messrs. Rottmann & Co.; pottery ornaments, the Bareham Pottery Company; pewter work, Mr. Thomas Heath; and heating apparatus, Messrs. Rosser & Russell.

## AMHERST SCHOOLS, GUERNSEY.

THESE schools are about to be erected to supply a deficiency in the school accommodation of one of the suburban districts of St. Peter Port. Competitive designs were advertised for last year, and those submitted by Messrs. Colson, Farrow & Nisbett, architects, of Winchester and London, were selected as the most suitable.

The site is an uneven one, both the adjacent roads sloping away from their point of junction at which the land is highest. In order to obviate the inconvenience of having floors at different levels, or great difference between floor and outside ground levels, which would have been inevitable if the entire frontage of the school had been arranged parallel to and facing one of the roads, the architects decided to place the boys' and girls' schools in separate

but symmetrical blocks, each facing one of the roads, and being united by means of the teachers' and cloak-room block. By this means the difference of the levels is rendered less conspicuous.

Each block will accommodate 252 children, making a total of 504 places. There are four class-rooms in each school, having places for sixty-eight, sixty-four, sixty, and sixty respectively. These are formed by dividing two large schoolrooms by means of Messrs. Peace & Norquay's sliding partitions, thereby obtaining the advantages of larger rooms for assembly and drill without the extra expense of a central hall. The cloak-rooms and lavatories for each sex are placed near the children's entrances, and two teachers' rooms which may be thrown together to form a parish meeting room occupy a central position, from which the whole building can be superintended.

The only local building material for external work is grey granite, and the elevations are accordingly treated in a style suitable to its use. The gables are "stepped," the stone is hammer-dressed, the general wall surface being light grey, with quoins, dressings, and plinth course of a darker tint. Internally the walls will have a dado 4 ft. high, formed with salt-glazed bricks, the upper part being of local bricks, and coloured. The roofs are to be constructed with wrought, rebated boarding upon purlins, stained and varnished internally, and covered externally with Broseley tiles. It is proposed to warm the building with low-pressure hot water.

Estimates are now being prepared by local builders, and it is hoped that the building may shortly be commenced.

◆

THE STUDENT'S COLUMN.—Owing to the pressure of other matter, our Student's Column article ("Architectural Hygiene") is held over until next week.

METHODIST NEW CONNEXION CHURCH, WEST HARTLEPOOL.—A new church for the Methodist New Connexion has been erected in Park-road, West Hartlepool. In the chapel, seating accommodation is provided for 550 persons, and there are vestries for the minister and choir. A church parlour separates the chapel from the schools, the principal room of which is 60 ft. by 30 ft., giving accommodation for between 350 and 400 scholars. There are also three class-rooms and a room for infants. The heating throughout is accomplished on the low-pressure hot-water system. The building contract has been carried out by Messrs. J. Howe & Co., of West Hartlepool. Mr. J. Garry, of West Hartlepool, was the architect.

## THE DECORATION OF ST. PAUL'S.

THE following memorial, signed by architects, was presented on the 12th inst. to the Dean and Chapter of St. Paul's:—

In a letter to the *Times*, which appeared on May 6, Sir W. Richmond has to all intents defied the instructed opinion of this country in regard to the decoration of St. Paul's. We, the undersigned architects, therefore feel it our duty to protest against the continuance of the works of decoration until full opportunity has been given for the consideration of the whole scheme by the best expert opinion available. St. Paul's Cathedral is the most characteristic of our national monuments. It is now in imminent danger of losing the grave dignity which has endeared it to the heart of the majority of Englishmen, and, in our opinion, this is due to the fact that Sir W. Richmond's scheme, whatever its abstract merits, has not been thought out in sympathy with and in subordination to the architecture of the cathedral.

1. The chief inspiration of Sir W. Richmond's design has been sought in Byzantine art, with certain motives suggested by English designers of this century. It would be impossible to conceive anything more alien to Wren's genius

and to the intellectual atmosphere in which he lived and worked.

2. In St. Paul's Cathedral, as in any other masterpiece in architecture, a certain scale has been set by the original designer which cannot be abandoned without serious injury to the effect of the whole building. The scale that Wren intended was followed by Stevens in the designs that he made for the spandrils under the central dome, and the discrepancy between this scale and that adopted by Sir W. Richmond can be measured by a comparison of the figures on the spandrils with Sir W. Richmond's figures in the half domes over the canted angles below. In our opinion a fatal injury is being done to the proportions of St. Paul's by this substitution of Sir W. Richmond's scale for the scale of Sir Christopher Wren.

3. The decorations now being carried out involve actual injury to the stonework of the cathedral as left by Wren.

In the four great arches at the north-east, south-east, north-west, and south-west angles under the dome, Wren, in order to satisfy the eye as to the constructive stability of his arches, left plain piers or abutment under the arches, and he deliberately abstained from any ornament to these piers in order to make clear the idea of strong support, which is their actual function. Sir W. Richmond has formed raised panels on these piers and studded the margins and divisions with *pateræ*—that is to say, Sir W. Richmond has stultified the architect's design, and in nearly every detail of his decoration he has, in our opinion, shown the same indifference to the clear intention of the architecture.

Sir William Richmond has practically admitted his dislike of that architecture in his letter of May 6, a letter more remarkable for its courage than for any appreciation of the gravity of the case. It seems to us that an artist so evidently out of touch with the conditions of his work should not be permitted to alter the character of the finest work of modern English architecture, and this feeling we believe to be that of the great majority of intelligent and educated Englishmen. We desire in no way to disparage Sir W. Richmond's attainments and well-earned reputation, but we cannot regard them in comparison with the fame of Sir Christopher Wren and the loyal preservation of his work. We protest as Englishmen against this subversion of the character of our national cathedral, and we resent, as artists and admirers of Wren, this tampering with the intention of one of the greatest of English architects.

## INSTITUTE OF BUILDERS:

### ANNUAL DINNER.

THE annual dinner of the Institute of Builders was held on Thursday evening last week at the Grand Hotel, Charing Cross. The chair was taken by the President, Mr. Joseph Randall, and among those present were the Rev. H. Hirsch, Colonel Gehle, R.E., Alderman W. Holdsworth (President of the National Association of Builders), Mr. J. Clusson Preston (Master of the Worshipful Company of Carpenters), Mr. G. H. F. Prynne (President of the Architectural Association), and Messrs. Edward White, L.C.C., A. Ritchie, C.C., Howell J. Williams, L.C.C., H. H. Bartlett, F. S. Bywaters, J. H. Docwra, F. J. Dove, B. J. Greenwood, T. Gregory, R. S. Henshaw, H. Holloway, H. W. Horner, F. May, H. Northcroft, A. Pennington, A. F. Randall, T. F. Rider, W. Shepherd, Strudwick, B. Tabberer, W. H. Turnbull, C. Wall, T. Costigan (secretary), and others.

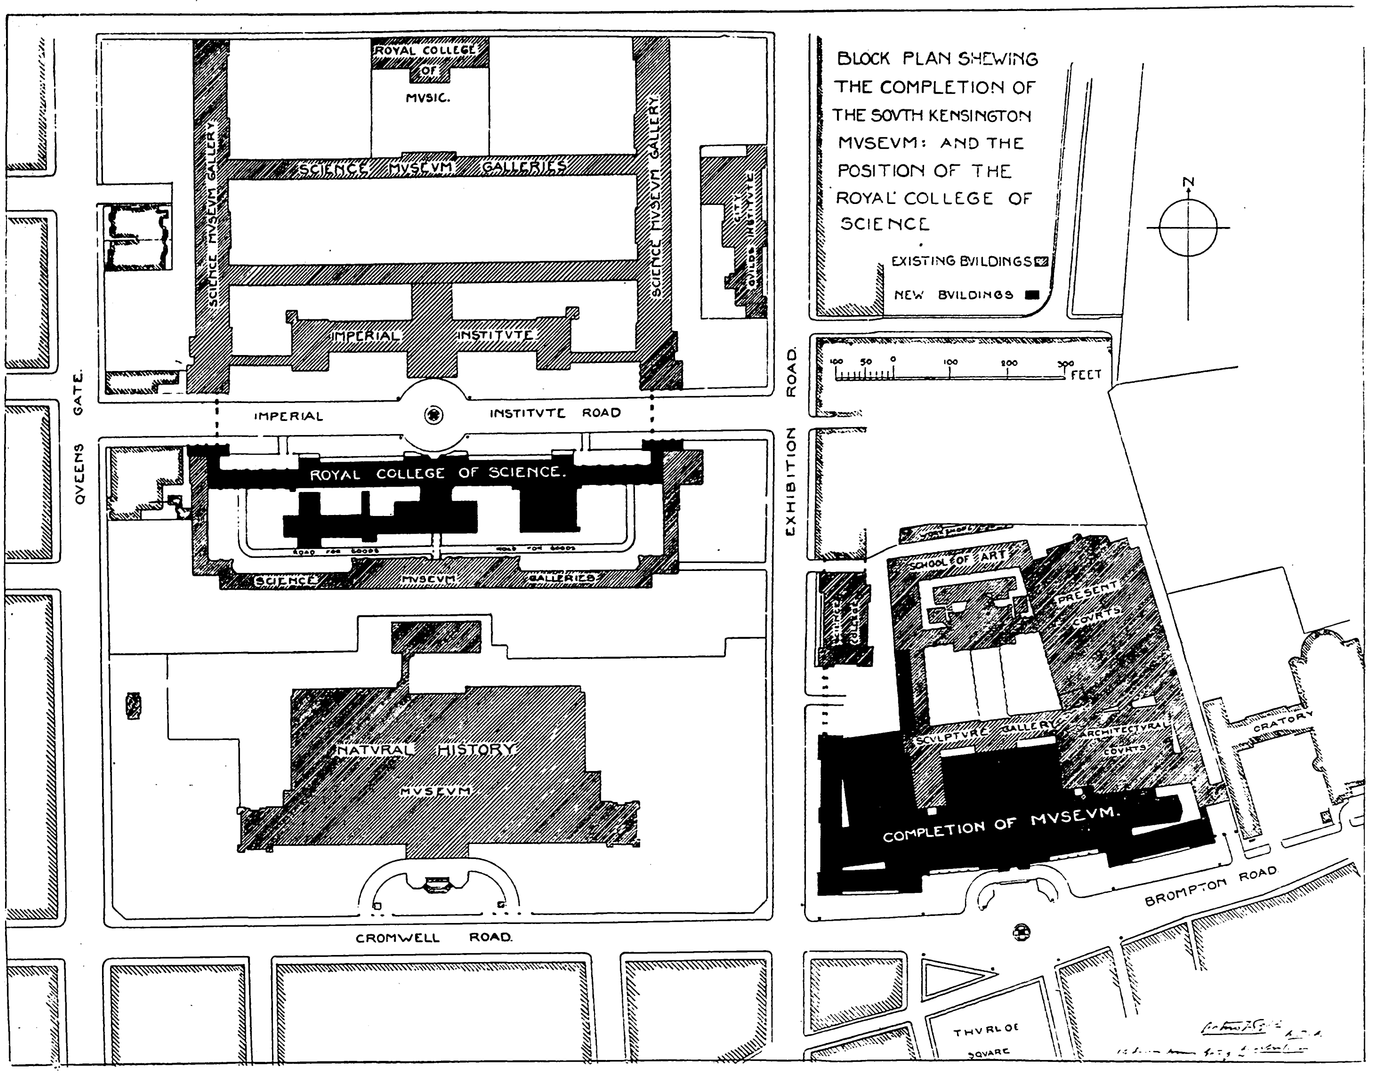
The usual loyal toasts having been duly honoured, Mr. H. J. Butter proposed "The Navy and Army," coupled with the name of Colonel Gehle, R.E., who responded.

The Chairman then gave the toast of the "Institute of Builders." He said that the object of the Institution was to uphold the honour and integrity of the building trade, and already it had earned an excellent reputation, although still young as an institution. He could not help regretting that the old modes and rules of work which had contributed so much to the greatness of this country were being abandoned, and that new rules were being forced upon them which caused great difficulties in the execution of their works. Legislation had become more exacting; they laboured under the terrible onus of the new Workmen's Compensation Act, disputes with labour had greatly increased their watchfulness, trouble, and anxiety; and not only had the cost of labour gone up, but the action of the unions made it impossible to estimate the cost of labour with any degree of accuracy. He had noticed in the *Builder* last week that there were no less than thirty disputes at present in the building trade in England and Wales, and he could not see that these differences had led or would lead to any beneficial result to one side or the other. A better feeling would be for the best interests of all concerned, and if they could have a good understanding once and for all it might help to bring back to England some of those businesses which had been driven out of the country. A great part of the steel trade—joists and girders, and engineering work and machinery—had gone away. No firm here could promise to complete a job in any reasonable time. Then they had to compete not only with America, but with Germany. The Germans had monopolised nearly the whole cement trade of America, which ten years ago belonged to this country. A great part of the furnishing trade was now Austrian and German, and a large part of the joiner's work used in this country was now imported ready manufactured. If he were building a thousand houses he could readily import sashes and frames and other joiner's work complete. Nine-tenths of the glass trade had gone to France and Belgium. Merchants in this country did not know where their glass came from because it went into a pool. Altogether the outlook was not very cheering. They noticed that the London County Council and other public bodies had taken up the idea of becoming builders, perhaps to aid in the extinction of the trade or possibly to help the peace of mind of its members. Public bodies might think they could become contractors, but all in the trade knew the long years it took to acquire the experience necessary for success. So far as they could see from the public records, there were more bankruptcies among builders than in any other trade. Their earnest desire in that Institute was to see building prosper, and to that end to condemn any practice which might lead to inferior work. The builders strongly desired that architects should establish some recognised standard of contract conditions. For years they had been trying to arrive at an agreement in this matter, the differences had been brought down to a narrow issue, and he thought it was high time that the remaining difficulties should be overcome. If both parties put their backs against the wall, of course very little progress would be made, but the settlement of fair conditions ought not to be an impossible task. Another point on which he would like to touch was the question of the quality of materials, and the tests applied. In the case of cement it was possible to go to an independent expert, but why should they hear so much about this or that cement being "best." Some latitude should be allowed to builders to suggest alterations in material and variations of structural detail in the event of strikes or other disturbances of trade. Also he would like to suggest that before a job was started the specifications and drawings should be complete. If they gave a builder imperfect drawings, and doled them out to him one by one, foot by foot, he would defy any living man, however clever he might be, properly to organise his work, or to carry it out with expedition or profit. When the work was begun the specifications should be properly explained, and the details should be accurate. When they had the drawings doled out one by one it set up that irritating, "pin-pricking" sort of business that was certain to lead to differences and disputes, and perhaps to arbitration or law suits. All that might be avoided if the drawings were properly made and details given before a job was started. Builders did not in any way seek to dictate their own terms, but there were many concessions the benefit of which would be felt not only by them but by the architect and his client. If a building was worth spending 10,000*l.* or 20,000*l.* upon, it was worth while also to get it done in the time agreed. Why should a client put his hand in his pocket and spend a lot of money unless he was to get the work done at the time when he had been led to expect it? At present it was quite impossible to get a guarantee of time from any one supplying ironwork. A spirit of mutual confidence between architect and builder would not interfere with the independence of either. Why should not a builder be able to go to the architect and say, "I am unable to get such and such things; will you allow me to substitute so and so, and if the cost is less, I will give you the advantage?" If the client's interest were served, the architect would see that the request was reasonable, and would agree to it. In conclusion, he hoped that for ages to come men would be able to look upon buildings which were monuments of the genius of the architects of to-day, and evidence of the faithful and enduring work of those by whom those creations of genius were erected.

The toast was honoured with enthusiasm, after which

Mr. B. J. Greenwood proposed the "Architects and Surveyors." Although the toast was "The Architects and Surveyors," the combination was not a happy one when both were found in the same individual. Combination was the order of the day, and some men had no hesitation in taking up fourteen or fifteen trades at once. Architects in these days had a great deal to put up with, and must be men of exceptional courage. When the plans were drawn for a building in the metropolis the trouble had only just begun. No sooner was the work begun than up sprang a legion of "ancient lights" all round, many of them so obscured by dirt and neglect that they had long ceased to be lights at all. The architect had to be a good lawyer, a good financier, and a good all-round man if he was to deal with all these claims in a satisfactory way. Then in walked the County Council to say "This won't do" and "That won't do," and after that the sanitary inspector came round. Then after that the architect had to deal with the builder, and last of all to go and deal with his client again; and perhaps that was the most difficult of all. As to styles of architecture, he was reminded of a story of the late Mr. C. H. Spurgeon, who on looking at a house in Norwood was told it was in the "Queen Anne" style. Then he went round and looked at the rear, and he said, "This style must be the *Mary* Anne." They all knew of a good deal of architecture in London that answered that description. Coming to the surveyors, he said that quantity surveyors were men in whom builders had the utmost confidence. In some cases quantities were not made part of the contract, and when the builder signed he was absolutely dependent on the quantity surveyor whose name appeared at the foot. If that name were well known he felt much safer than if the name were unknown and he had to put his trust in Providence.

Mr. G. H. Fellowes Prynne responded on behalf of the architects, and said that he was not only a member of the Institute, but represented the junior society of architects—the Architectural Association—which sought to educate the members of the profession, instead of leaving them, as had too often been the case, to be educated by the builder. As a member of the Council of the Institute, of course he knew how much had been done by the Institute of Builders in regard to the question of conditions of contract and also with regard to the important point of damages for want of detail. Of course there were two sides to the question, and the Council of the Institute had done their best to thrash out the whole matter. He saw perfectly the builders' view of the question. Under the arbitration clause they wished that any point of dispute that turned up during the contract should be at once arbitrated. But the architect's life was not a happy one. He had to put up with many difficulties that perhaps even contractors did not understand, and to add to those difficulties the continual worry of arbitration on every detail that arose during the progress of a contract would make life intolerable. He was sure that the contractor, putting himself in the place of the architect, would understand that view of the matter. There were builders and builders, just as there were architects and architects, and a



(*See second article in this issue, page 485-6.*)

builder wishing to make himself disagreeable might keep finding causes for arbitration all the time. As to the second point, damages for want of detail, that was another case in which the difficulties of the contractor must be very great indeed. He agreed that half-inch details at least ought to be signed with the contract. But the architect had the art side of his work to look at, and if it was a creation and not a mere copy, then in a building of considerable size it took a long time to fill in detail in an artistic way. If the architect was being pressed to get the building started and the contract signed, it was a very difficult thing to give the builder complete details at the outset. Again, in this case a builder might easily obtain an unfair advantage over an architect by threatening to claim damages for want of details. There were difficulties on both sides, and he could only hope that a proper settlement would be arrived at. If ever there was a time when an institute like the Institute of Builders was needed, it was now. Combination amongst master builders was more needed than ever before. Loss of trade was causing the greatest suffering among the poor. An enormous amount of work was going to America, and energetic agents were seeking high and low for orders for Germany. The building of the Egyptian bridge given an American firm the other day ought to be a warning to our working men. He had immense faith in the honest English workman, but he believed we were losing trade simply through the unsettled condition of labour. He believed workmen should have an absolutely free right to combine, but they could not be allowed to force their conditions on employers until the latter had no control over their own business. He was glad to see the admirable answer of the secretary of that Institute to the plasterers, whose demands went so far as to order that some plaster work should actually be taken down because it had been done by a bricklayer. He thought that if labour went to such extremes in its demands they could not wonder if masters were seeking abroad for men who would meet their wishes. He believed a strong line must be taken, and the Architectural Association had sent a resolution expressive of their fullest sympathy with the employers. In conclusion, he said that the one wish and desire of the Institute of Architects was to arrive at relations of complete friendliness with the builders as a body.

Mr. T. Franklin, on behalf of the Surveyors, in the course of his remarks, said that what the builders wanted was that the quantities should be taken out by some one who could do it thoroughly, and, if not done thoroughly, they wanted the right to have the work remeasured and paid for at prices that were fair. Then people would not employ surveyors whose work had to be measured over again, and came to double the money. He was not the only surveyor who had measured work done by others and made it come to double the money, and he could do it again !

Mr. T. F. Rider then, in a complimentary speech, gave the health of the President, who, in responding, regretted the absence, through illness, of their old friend, Colonel Stanley Bird.

Mr. Henry Holloway next proposed the toast of "The Visitors," referring to the pleasure with which they saw at their board such men as Mr. Preston, Master of the Carpenters' Company—a Company which had done so much for education in the building trade ; Alderman Holdsworth, President of the National Association of Builders, who had fought the battle for them against the plasterers ; and also another very distinguished gentleman, who had fought their battle in the London County Council, *i.e.*, Mr. Edward White. Then, of course, they welcomed their architect and surveyor friends.

He coupled the toast with the name of Mr. Harry Northcroft, who suitably responded.

◆

THE ARCHITECTURAL ASSOCIATION SUMMER VISITS.—There is a slight correction to be made as to the arrangements for the summer visits of the Association. On June 3 the visit will be to Cobham Hall, Kent, by permission of Lord Darnley ; the very interesting church and fifteenth century College will also probably be visited, conducted by Mr. T. W. Aldwinckle and Mr. G. A. Lansdowne. Under date July 29, Lea Park, near Godalming, is described as "Lee Park, near Blackheath."

## ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

THIS Association held an Eastern Counties district meeting at Ipswich and Felixstowe on Friday and Saturday, May 12 and 13. The business proceedings of the meeting were commenced in the Town Hall, Ipswich, at mid-day on Friday. The President (Mr. C. Claude Robson, of Willesden), occupied the chair, and amongst those present were Professor Kennedy, Messrs. W. Weaver, Kensington ; J. P. Barber, Islington ; W. H. Savage, East Ham ; J. Pollard, Westminster ; T. Cole, Secretary, Westminster ; J. T. Eayrs, Birmingham ; E. Pritchard, Birmingham ; Bennett, Southampton ; E. Buckham, Ipswich ; H. Goodyear, Colchester ; A. Hayward, Sudbury ; Jeavons, Hertford ; Clare, Sleaford ; A. H. Campbell, Canterbury, and others.

The Mayor (Mr. E. P. Ridley) in welcoming the members of the Association, said there was no doubt modern life owed a great deal to the work of the municipal engineer.

The President acknowledged the cordial reception given to the members of the Association. They highly appreciated the privilege accorded by the Mayors and Corporations of various towns in offering invitations to the Association to hold its meetings in their respective towns. These meetings enabled the members to gain experience of new works and to gather up fresh facts and ideas which they would find it difficult, at any rate satisfactorily, to obtain in any other way.

On the proposition of Mr. A. E. Collins (Norwich), Mr. Cockrill, of Great Yarmouth, was re-elected Honorary District Secretary.

### *Electric Lighting.*

Professor Kennedy then delivered an address on the principles and equipment of an electric lighting station. In large towns where space was valuable he advocated the use of some form of tubular boiler, but where ground was not so expensive it was often advisable to economise cost and use the simpler form of Lancashire boiler. As to the types of engines to be used, they ought to use those which would drive the dynamos direct without the intervention of any belting. In America it was the custom to use slow speed engines, but in this country it was more usual to use a high speed engine, with a short stroke and a great many revolutions per minute. Personally, he thought the advantages in almost every case were on the side of the high speed engine, but he was perfectly well aware that engineers as good as he preferred the slow speed engines. He might say, however, that he had had high speed engines running for ten years, and that the maintenance cost had been small and the attention required in working a minimum. Coming next to the question of dynamos, he could not resist the temptation to give them Mr. Preece's account of how a dynamo worked. Mr. Preece stated that in this matter they started with the knowledge that if a conductor were moved between the poles of a magnet what was called a current of electricity would flow in that conductor. The earth was a magnet, though rather a feeble one, and if a man took a copper wire in his hands and skipped with it in the plane of the earth's magnetism, north and south, a current would pass through that wire and through his body. Such a current would be infinitesimally small, but there it was, and they could measure it if they had instruments sufficiently delicate. Instead of taking a single wire, however, they took a very large number of wires and arranged them in a proper fashion; instead of taking a man's movements as the source of power they took an engine of 500 or 5,000 horse-power; instead of taking a very feeble magnet they took an enormously strong electro-magnet—and there was the dynamo. The current, having been generated, was supplied to consumers by means of trunk and feeder wires, and though the pressure might vary at different points in the mains, was supplied at even pressure to consumers residing at varying distances from the stations. At Ipswich it was proposed to put down, independently of any question of traction, sufficient power for the lighting of 8,000 8-candle power lamps. The popular idea always was that they would have all those lamps alight at one time, but he wished he could find that happy land. In Glasgow, when they first started, they had 60 per cent. alight at once. At St. James's and Pall Mall, London, where the greater part of the supply was to clubs, hotels, and similar places, they had 66 per cent. alight at once; but that was quite exceptional. In the district supplied by the Westminster Company—which covered St. George's, Hanover-square, St. Margaret and St. John, Westminster, they never had more than 27 per cent. alight at once. In a place like Ipswich for the first 10,000 lamps they might get very nearly half a light at once; but afterwards, when they went into the suburbs and took up the private residences, they would never have one half the lamps alight at one time. As to the cost to persons using the light the Act of Parliament allowed 8d. per unit—or about a farthing per 8-candle lamp per hour. No municipality of any importance had lately been charging more than 6d. per unit, and that made the cost about three-sixteenths of a penny per 8-candle lamp per hour. The tendency was to reduce this charge as much as possible, so as to increase the demand and cheapen the production. It was proposed later on to try and supply current for driving electric trams from the electric light station. This was to the advantage of any town to do, as it provided a continuous day load, extending over fourteen or sixteen hours a day. The question whether the municipality should own the electric light was one which had practically solved itself. He had had the pleasure of dealing with a number of towns, and in every case the electric light had proved a success and had not imposed a burden upon the rates.

### *Use of Heat from Destructors.*

Mr. A. H. Campbell, City Surveyor, Canterbury, next read a paper on the use of heat from destructors to assist in steam generation. He remarked that the rapid increase in the number of electricity stations throughout the kingdom had given an impetus to the consideration of this subject. That there was much latent heat and power contained in the cremation of town refuse went without saying; that there was not so much in it as some of the enthusiasts averred was evident from the very few stations which had as yet been erected. Nevertheless there was such a sufficiency of power contained in the cremation of refuse as to justify full inquiry and careful research and investigation by those having the requisite facilities of test and observation. And at the very lowest estimate it was the turning to profitable use of power hitherto unappreciated or left undeveloped. He had erected a refuse destructor plant in connexion with the electricity works at Canterbury, which had not yet begun work, though the guarantee of the builders was that 1 lb. of steam would be produced per 1 lb. of refuse consumed. The author quoted the experience of Oldham, Shoreditch, Llandudno, and Hereford to show that there was a great reserve of power suitable to the generation of steam for electricity works contained in house refuse when properly cremated.

Mr. Bennett, Southampton, said that for the past fifteen years he had been trying to develop as much power as possible for the destruction of refuse, and had done so with considerable financial advantage, but he ought to say that the power obtained was not constant, and had to be supplemented at times during the past two years. The power obtained from the destructor had been utilised for lifting by the stroke ejectors a flow of sewage of from 1½ to 2 million gallons in twenty-four hours.

Dr. Elliston, Medical Officer of Health for Ipswich, expressed pleasure at the prospect of town refuse being put to profitable account. Now that a water-carriage system was becoming generally adopted in Ipswich, the ordinary town refuse would not be accepted by the farmers as a gift. The accumulation of town refuse had a very serious effect upon public health, and especially in hot and dry summers was a fruitful source of disease.

Mr. A. E. Collins, Norwich, admitted there was power to be obtained from the burning of refuse, but it was not well to depend upon it as it varied so greatly.

Mr. Weaver, Kensington, remarked that the calorific value of refuse varied not only in different places but at different seasons of the year. For instance, in winter, when people were burning a lot of coal, they got very good refuse and considerable power; but in the summer, when the dust carts were laden with cabbage leaves and cockle shells, they had to burn coal to supplement the power. He had made a proposal to the electric light companies who had Kensington portioned out among them that if they would put up a 30-cell destructor at a cost of 25,000*l.* he would guarantee them 30,000 tons of refuse a year, and pay them 1s. a ton for destroying it. After they had given that offer consideration, Mr. Crumpton and the other electrical engineers declined it, except with a condition that if they did not find it satisfactory they could call upon the Authority to take over the destructor and repay them the whole cost they had been put to. That showed that electricians, when it affected their own pockets, were not so enthusiastic about the power-raising property of house refuse as persons with destructors and furnaces to sell. He mentioned this as a caution to municipal engineers to be careful about embarking upon any expenditure for destroying house refuse, as they would find it both a varying quantity and a varying quality.

Mr. J. Parker, Hereford, claimed that he had been raising an average of 120 h.p. per day of ten hours for the destruction of his house refuse.

Mr. Barber, Islington, was exceedingly glad to hear so high an authority as Professor Kennedy speak of the advantage to be derived by a condensing plant, and the abolition of gearing in connexion with machinery. Sometimes one found it very difficult to make members of their committees understand the advantages to be derived from the use of a condensing plant and direct driving. He was glad Mr. Campbell had not taken too easy a view of the power to be derived from the burning of house refuse. Reference had been made to the varying quality of the refuse, and he might say that, by the adoption of a weekly system of collection in Islington he had found that the character of the refuse had changed entirely. It had become of a lighter character altogether, with a larger proportion of paper and vegetable matter of no calorific value.

The President said it was gratifying to all towns intending to adopt electric light to hear from Professor Kennedy that in all probability it would be a benefit rather than a burden to the rates, because there was no doubt that that bugbear, a burden on the rates, was keeping many towns from adopting this cleaner light. He suggested that the use of electric light might be largely increased if facilities could be provided for the free wiring of premises by the municipal authorities or the electric light company. Many persons would be willing to pay a small extra amount for the light who would not be willing to pay a larger capital sum for the wiring of their premises.

Professor Kennedy, in replying to the vote of thanks, which was accorded by acclamation, mentioned that one or two firms or companies were willing to make arrangements for free wiring.

The Mayor of Ipswich then entertained the company to luncheon in one of the rooms of the Town Hall. The Mayor presided, and in addition to the members of the Association attending the meeting, many of the members of the Town Council were present. The toast list was limited to the Queen, the Association of Municipal Engineers, and the health of the Mayor, and the afternoon was devoted to visits to the air compressing station, the Waterside Engineering Works of Messrs. Ransomes & Rapier, where the sluices for the Nile dam are being manufactured; the Orwell Works of Messrs. Ransome, Sims, & Jeffreys; and the waterworks. On Saturday morning, before leaving for Felixstowe, many of the members visited the new high-speed engine works of Messrs. Reavell & Co.

The scene of Saturday's meeting was Felixstowe. The day's proceedings commenced with a luncheon at the Bath Hotel, given by the chairman and members of the District Council. Subsequently a meeting was held in the Town Hall, at which Mr. J. T. Eayrs, Birmingham, presided, in the absence of the President (Mr. Robson).

### *Drainage Works of Felixstowe.*

Mr. G. S. Horton, Borough Surveyor of Felixstowe, contributed a paper on the Shone drainage system, and other works of Felixstowe. He said that after looking round and inspecting works on the Shone system he came to the conclusion that it was a system peculiarly well suited for a place like Felixstowe, and the Council were unanimous in approval of his recommendation that it should be adopted. Messrs. Shone & Ault, of Westminster, were appointed consulting engineers, and since the drainage had been completed, now over three years, the works had given complete satisfaction. The proposal to discharge the sewage into the sea encountered a lot of opposition from the Harwich Harbour Commissioners and the War Office, and after negotiation the present system of discharging the sewage was agreed upon. In order to ensure efficient self-cleansing, gravitation sewers throughout, &c., had divided the district into practically four separate drainage areas, and for these the sewage was collected automatically, and was ejected and delivered to the outfall tanks, near to which the air compressing station was erected. The drainage of Felixstowe was practically on the separate system, and the volume of sewage and rainfall combined was estimated, on the assumption that the sewage would amount on the average to twenty gallons per head per day, and that 1 in. of rain would fall per day of twenty-four hours on at least 400 square feet of hard surface connected with every house drained. The outfall works were placed on flat, wet, low-lying land, the surface of which was 344 ft. over ordnance datum, and 5 ft. below high-water spring tides. In order to comply with the conditions imposed by the War Department, and the Harwich Harbour Commissioners it was necessary to erect the outfall tanks of a capacity sufficient to discharge two-thirds of the maximum volume of sewage estimated to flow from the population of Felixstowe in 1924 within the prescribed time, that was for five hours during each receding tide. To do this two tanks were provided, each holding 295,000 gallons of sewage. The sewage, as it was to be delivered at the tanks, was to be deodorised by ferrozene. The discharge of the treated sewage effluent into the sea had to take place from one hour after high water to two hours before low water.

### *Rural Sanitation.*

Dr. C. G. Havell, Medical Officer of Health for Felixstowe, contributed a paper on "Some Aspects of Rural Sanitation." He said that while fully acknowledging the improvement in public health and comfort resulting from the sewerage system in Felixstowe, he would like, in passing to the general question of rural sanitation, to urge that there was too great a tendency to insist on a system of sewerage and drainage as a *sine quâ non* in sanitary reforms. The essence of sanitation, so far as excreta and refuse were concerned, was to secure its resolution into harmless and, if possible, useful elements, without nuisance or danger to population. This was best accomplished by its immediate and direct application to cultivable soil. Whether the water-carriage system of sewage was an economical and efficient mode of transport he must leave engineers to determine, but that it had many drawbacks none would dispute. In his opinion these disadvantages became so prominent in rural districts as to largely discount any merits it might possess. The difficulty of meeting the increased quantity of water required and the waste which was encouraged by the water-carriage system of sewage was becoming a matter of national importance. He would say nothing about rates, because any expense necessarily incurred in safeguarding public health was justifiable. But to his mind the most valid objection, and an almost insuperable one, was to be found in the difficulty of getting and maintaining the high standard of construction required to protect houses from the danger of sewer gases. The provision of the multiplicity of traps and the profusion of ventilation arrangements stipulated for were an admission of the danger; and although they might be efficiently worked out on paper he believed their execution was beyond the capacity of the average country workman. At any rate there was no doubt that either he was unable to comprehend the importance of good workmanship and sound jointing, or his conscience was so elastic that it enabled him to dispense with both. If trade organisations did half as much to encourage a good standard of workmanship as they did to screw up wages, their legitimate objects of improving the status of the workman would be more surely attained, and the public health would gain. But when all was done, and the outfall reached, they had often only arrived at the beginning of trouble in efforts to dispose of the sewage without the fouling of river or stream. Happily it seemed as though this were now in reach of attainment by the wonderful results of intermittent filtration in the bacterial tanks. But the resolution of excreta and refuse, and its utilisation, was a problem still to be faced by sanitary authorities after their sewerage scheme was completed,

Mr. Buckham, Ipswich, Mr. J. P. Barber, Islington, Mr. Shone, Westminster, Mr. Savage, East Ham, and Mr. Hayward, Sudbury, took part in the discussion on the papers. The remainder of the day was devoted to a visit to the Landgard Fort and to the sewage outfall tanks.

## THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of this Council was held on Tuesday in the County Hall, Spring Gardens, Lord Welby, Chairman, presiding.

*Loans.*—On the recommendation of the Finance Committee, it was agreed to lend the Battersea Vestry 12,032*l.* for sewer reconstruction works, and 11,076*l.* for channelling, &c., works; St. Saviour's District Board 12,730*l.* for paving works; Whitechapel District Board 25,000*l.* for the purchase of land; Guardians of St. George's-in-the-East 1,600*l.* for works at infirmary; and the Whitechapel Guardians 7,000*l.* for purchase of land for the extension of their infirmary.

*Proposed New Fire Station, Redcross-street.*—The Fire Brigade Committee recommended, and it was agreed, (*a*) that the estimate of 31,500*l.* submitted by the Finance Committee in respect of the acquisition of a site for a new station in the City be approved; that the Council do acquire for 31,000*l.* the freehold of Nos. 35, 36, 37, and 38, Redcross-street, the Council paying in addition costs under the Lands Clauses Act and one surveyor's fee of 156*l.* 9s., and that the Solicitor do complete the matter. (*b*) That the Fire Brigade Committee be authorised to make the necessary preliminary arrangements for the erection on the above-mentioned site of a fire brigade station in substitution of the existing Whitecross-street station.

*Fire Station, Clapham.* — The same Committee reported, and it was agreed:—

(*a*) That the estimate of 3,100*l.* submitted by the Finance Committee in respect of the acquisition of a site for a new station at Clapham be approved; that the Council do agree to acquire for 3,000*l.* the freehold of the premises known as The Cedars, Old Town, Clapham, and that the Council do enter into an agreement to purchase the property at that price on March 25, 1901, or earlier should the owners be able to give possession before that date, the owners to convey to the Council a cleared site; and that the Solicitor do complete the matter.

(*b*) That the Fire Brigade Committee be authorised to make the necessary preliminary arrangements for the erection on the site of The Cedars, Old Town, of a station in substitution of the existing Clapham station.

*Electrical Traction for Tramways.*—The following recommendations of the Highways Committee were agreed to:—

(*a*) That the resolution of the Council of October 18, 1898, relative to the use of electrical traction on certain of the tramways of the London United Tramways, Limited, be rescinded.

(*b*) That the Council do consent, on the terms stated in the letter, dated September 27, 1898, from the managing director of the London United Tramways, Limited, to application being made by the company for power to reconstruct, in accordance with the overhead trolley system of electrical traction, the tramways (*a*) in that part of Uxbridge-road between the "Askew Arms" public-house and the railway-station, and (*b*) from Uxbridge-road railway-station *via* Goldhawk-road to Young's Corner, on condition that the company do also reconstruct, according to an underground system of electrical traction, the tramways (*c*) from Young's Corner *via* King-street to Hammersmith Broadway; it being understood that, should the Council when the proper time arrives decide to purchase those portions of the company's tramways which are situated within the County of London, the Council shall pay the "then value" of the tramways (*c*) above referred to.

*Turner, Ruskin, Romney, and Rossetti Buildings, Millbank Estate.*—The Report of the Housing of the Working Classes Committee contained the following paragraph:—

> "The Council is now proceeding with the erection of dwellings on the Millbank Estate. The estate is laid out so that seventeen blocks of dwellings may be erected, and these dwellings will provide accommodation for about 4,300 persons. One block only has so far been completed. In accordance with the usual practice, the Manager of Works was asked in December, 1898, whether he was prepared to erect two blocks of dwellings, to be called Leighton and Millais Buildings, at the amount of the Architect's estimate, viz., 12,380*l.* The Manager was not prepared to undertake the work at this amount, but before inviting tenders the Architect, under our instructions, endeavoured to arrange a schedule of prices with him for all the dwellings to be erected on the estate. The Manager, however, could not see his way to accept the schedule proposed. Tenders were, therefore, invited from selected firms, and on April 25, 1899, the Council accepted the tender, amounting to 12,380*l.*, of Messrs. Holloway Brothers for the erection of Leighton and Millais buildings. This tender was the lowest of the five submitted, and is at the amount of the Architect's estimate which will enable the dwellings to be erected without involving a charge on the county rate. Leighton and Millais buildings are two of the blocks of dwellings which will face the proposed open space on the estate. The other two blocks which will face this open space are Turner and Ruskin buildings, whilst two further blocks (Romney and Rossetti buildings) will be erected immediately at their rear. The sites of these four blocks can therefore be readily enclosed with those of Leighton and Millais buildings, so that building operations in respect of all six blocks could be expeditiously carried on at the same time by the same builder. Sketch plans and preliminary estimates of Turner, Ruskin, Romney, and Rossetti buildings have been already prepared, and these buildings will be similar in character to Leighton and Millais buildings. As the Architect strongly advised us that such a course would save both time and expense, we instructed him to ascertain whether Messrs. Holloway Brothers. would be prepared to proceed at once with the erection of Turner, Ruskin, Romney, and Rossetti buildings on the same terms and at the same schedule of prices as they had already undertaken to erect Leighton and Millais buildings. This schedule is in the aggregate lower than that which the Manager did not see his way to accept; it has been most carefully analysed in regard to the most recent data available, and we are advised that there is no recent schedule of any contract in hand which is so economical. The architect has now reported to us that Messrs. Holloway Brothers are willing to undertake the work, and we therefore propose that the contract for Leighton and Millais buildings should be extended as above indicated. The chief considerations that have led us to bring this proposal before the Council are—first, the necessity for expedition in the erection of the dwellings; and, secondly, the question of cost. The proposal we make will, if adopted by the Council, greatly accelerate the erection of the four blocks of dwellings now under consideration. On the other hand, if the Council should determine to adhere to the usual procedure, the process of preparing for fresh tenders involving bills of quantities, and the time necessary to enable such tenders to be received, will entail so much delay that the best months of the building season will have passed before building operations can possibly be commenced. Moreover, in view of the unsettled state of the building trade, it is highly improbable that such a satisfactory offer could again be obtained. The details of the four blocks are as follows—Turner and Ruskin buildings each contain 6 four-room, 78 three-room, and 86 two-room tenements. The average size of the living rooms is 157 square feet and of the bedrooms 112 square feet. The Architect estimates that the cost of these two block will not exceed 46,420*l.* for buildings and 700*l.* for architect's expenses, incidentals and supervision (not including quantities). Romney and Rossetti buildings each contain 50 three-room and 70 two-room tenements. The average size of the living rooms is 141 square ft., and of the bed-rooms 102 square ft. The Architect estimates that the cost of these two blocks will not exceed 27,930*l.* for buildings and 570*l.* for architect's expenses, incidentals and supervision (not including quantities). We have, therefore, forwarded estimates of 47,120*l.* and 28,500*l.* to the Finance Committee, who will report thereon in due course. We recommend—That the estimates of 47,120*l.* and 28,500*l.* submitted by the Finance Committee, in respect of the erection of Turner and Ruskin, and Romney and Rossetti buildings, Millbank Estate, be approved; that the offer of Messrs. Holloway Brothers to erect the dwellings on the same terms and at the same schedule of prices as that on which they have contracted for the erection of Leighton and Millais buildings on the same estate be accepted; that the Solicitor be instructed to prepare the necessary contract, and that the seal of the Council be affixed to such contract when ready."

A long discussion took place on this, during which the opinion was expressed by several councillors that such a large work ought to be put out to tender. Messrs. Holloway Brothers, it was stated, had tendered for the Leighton and Millais Buildings, and their tender was 8 per cent. lower than that of the Works Department, and for this reason the Architect recommended that the work of erecting Turner, Ruskin, and Romney, and Rossetti buildings be given to the same contractors. It was also stated that in a second offer by the Works Department for Leighton and Millais buildings, their tender was 3½ per cent. higher than Messrs. Holloway's. This statement was denied by several speakers, but Mr. Waterlow, Chairman of the Building Act Committee, adhered to it, and it was substantially confirmed by the Architect in a letter which was read. Mr. Burns spoke very strongly against what he called the favouritism shown towards Messrs. Holloway. On a division the recommendation was agreed to by a large majority.

*Tower Bridge Northern Approach.*—The Improvements Committee recommended, and it was agreed, that the estimate of 9,000*l.* submitted by the Finance Committee be approved, and that the Improvements Committee be authorised to acquire from the London and North Western Railway Company, upon the terms stated in the Committee's report, the land needed for widening Mansell-street at Nos. 60 to 78, and to take all necessary steps for completing the widening of that portion of the thoroughfare, as shown upon the plan approved by the Committee on May 3, 1899.

*The Old Tudor House, Bromley.*—The question of pulling down this house (for details of the matter, see our last issue, page 469) was again discussed.

Mr. B. Cooper last week moved an amendment to refer the report back for further consideration, on the ground that the house was a Tudor building of much archæological interest.

Mr. Renwick Seager said antiquarians were agreed that the demolition of the house would be a loss to London.

Mr. Torrance supported the Committee's recommendation, believing that this ramshackle building was of no historic interest, and that it would be a crime to deprive a crowded neighbourhood of any portion of the proposed open space.

Mr. Bull said the house was an interesting specimen of architecture, dating back to the reign of William and Mary, and ought to be preserved.

Colonel Rotton, Chairman of the Parks Committee, said the house had no artistic merit, and would cost 800*l.* to renovate. He thought that amount would be far better expended in laying out the land.

After further discussion, the Council divided:—For the amendment 65, against 31. The report was therefore referred back to the Committee.

*Deposit of Refuse in Plumstead.*—It was agreed that the Public Health Committee be authorised to take proceedings against, or in default of, the Vestry of Plumstead respecting the deposit of offensive refuse in contravention of the Council's by-laws, should necessity arise in the future.

*Building Trades School.*—On the recommendation of the Technical Education Board it was resolved: "That in the event of the Ferndale-road premises, known as the Brixton Baths, being sold or used for other than educational purposes, a sum of 4,000*l.* (in addition to the 4,000*l.* already sanctioned) be paid by the Council to the Vestry of Lambeth; and that the solicitor be instructed to make the necessary arrangements."

*Ground Plan of London.*—It was agreed that the supplemental estimate of 750*l.*, inclusive, submitted by the Finance Committee, be approved, and that it be an instruction to the Corporate Property Committee to bring and keep up to date the latest issue of the 5-ft. ordnance survey, and that when the survey is complete information be supplied to the public upon payment of fees hereafter to be determined.

*Enlargement of the Hampstead Fire Station*—The Fire Brigade Committee recommended,

(*a*) That the supplemental estimate of 442*l.* 10s. submitted by the Finance Committee in respect of the enlargement and alteration by the Works Department of the Hampstead fire-engine station be approved; and that the Council do sanction in connexion with the work a further expenditure of that amount, or such part of it as may be found necessary.

(*b*) That 52*l.* 10s. (part of the before-mentioned amount of 442*l.* 10s.) be paid in full settlement of claims in respect of interference with the light and air of No. 53, Heath-street, and the inconvenience occasioned to the tenant owing to the rebuilding of the party-wall of those premises; and that the solicitor do complete the matter.

The recommendations were agreed to.

*New Fire Station for Islington.*—The following recommendation of the same Committee was agreed to:—"That, in the event of the manager of works reporting that he is not satisfied of the sufficiency of the architect's estimate of the cost of erecting the proposed Islington fire station, tenders for the execution of the work be invited by public advertisement."

*Remetalling Victoria Embankment Carriageway.* — The Highways Committee recommended, and it was agreed:—"That the Council do sanction the expenditure by the Highways Committee of a sum not exceeding 5,450*l.* for the remetalling of the carriageway of the Victoria Embankment, and the laying of iron pipes from one side of the road to the other for the mains required in connexion with the electric lighting of the Embankment and Westminster Bridge; that the work be carried out without the intervention of a contractor; and that the specification, quantities, and estimates be referred to the manager of works for that purpose."

*New Police Offices, Victoria Embankment.*—Messrs. Lawrance & Sons are the contractors for the erection of new police offices on the Embankment on the site hitherto occupied by the offices of the Civil Service Commissioners, and permission was granted them to erect a hoarding along the inner side of the footway of the Embankment.

*Elthorne-road, Islington.* — On the recommendation of the Improvements Committee it was agreed that the amount of the Council's contribution to the Vestry of Islington, in respect of the widening of Elthorne-road between Holloway-road and the entrance to Messrs. Carter, Paterson's premises, be 3,454*l.*; and that the matter be referred to the Finance Committee with a view to the payment of the money.

*Overhead Traveller, Crossness Outfall.*—On the recommendation of the Main Drainage Committee it was agreed that the tender of Mr. J. M. Henderson, amounting to 416*l.*, for the supply and fixing of a 10-ton overhead traveller at the Crossness Outfall, be accepted.

*Dollis Hill Estate.*—On the recommendation of the Parks and Open Spaces Committee it was resolved: "That the Council do inform the Voluntary Committee formed for acquiring the Dollis Hill estate for the purpose of a public recreation ground, that upon the land being secured and dedicated for ever to the public, and upon Parliamentary Powers being obtained to enable the Council so to do, and subject to an estimate being at the proper time submitted to the Council by the Finance Committee, as required by statute, the Council will contribute a sum not exceeding 3,000*l.* towards the cost of purchasing the land, conditionally upon the Willesden Urban District Council undertaking to maintain the place for ever as a place of public recreation; and that it be referred to the Parliamentary Committee to take steps to insert in the General Powers Bill of next Session any clauses necessary to give effect to this resolution."

*New Theatres, Whitechapel and Woolwich.*—The Theatres and Music Halls Committee reported that they had considered nine drawings of a theatre which it is proposed to erect in the Whitechapel-road, on the site of premises known as Wonderland, which were until last November licensed by the Council for music. The total boundary of the site of the proposed theatre is 556 ft., of which 31 ft. front to the Whitechapel-road, 155 ft. to a footway 20 ft. wide, 51 ft. to a footway 15 ft. wide, 93 ft. to a footway 10 ft. wide, and 226 ft. to buildings. The total frontage to thoroughfares of the width required by the regulations is 186 ft., whereas it should be 278 ft. To compensate for this, however, 144 ft. of frontage are given on to footways of 10 ft. and 15 ft. in width. A great improvement, which has been sanctioned by the Council, has been effected in the locality, as a footway 20 ft. in width will be formed between the Whitechapel-road and Charlotte-street. The theatre will have seating accommodation for 1,646 people, and the regulations as to construction will be strictly adhered to. The drawings were approved.

The Committee had also considered eight drawings of a theatre which it is proposed to erect in Wellington-street and Lower Market-street, Woolwich. The former street is 56 ft. wide and the latter 35 ft., and 237 ft. (4 ft. less than half) of the total boundary of the site abut on these streets. The theatre will have seating accommodation for 1,680 persons, and the arrangements generally are satisfactory. There is, however, a question for the Building Act Committee in respect of a projecting portico and an enclosed area and steps. The Committee recommended that the eight drawings in regard to the theatre which it is intended to erect in Wellington-street and Lower Market-street, Woolwich, be approved subject to the Building Act Committee being satisfied as to the projecting portico and enclosed area and steps. The recommendation was agreed to.

Having transacted other business, the Council adjourned for the Whitsun recess.

## APPLICATIONS UNDER THE LONDON BUILDING ACT, 1894.

AT the meeting of the London County Council on Tuesday, the Building Act Committee brought up the following list of applications under the 1894 London Building Act. Those applications to which consent has been given are granted on certain conditions.*

### *Lines of Frontage.*

*Lewisham.*—A one-story stable and coach-house on the south side of Taunton-road, Lee, at the rear of Nos. 32 and 34, Burnt Ash-road (Mr. W. T. Gates for Mr. W. Browne).—Consent.

### *Deviation from Certified Plans.*

*Strand.*—Certain deviations from the plans certified by the District Surveyor, under Section 43 of the London Building Act, 1894, so far as relates to the proposed re-building of the "Nag's Head" public-house, James-street, Covent Garden, at the corner of Floral-street, on the site of Nos. 10 and 10½, James-street, and portion of the site of stabling in Floral-street, at the rear (Mr. P. E. Pilditch for Mr. M. J. Atkins).—Consent.

*Lambeth, North.*—Certain deviations from the plans certified by the District Surveyor, under section 43 of the London Building Act, 1894, so far as relates to the proposed re-building of the "Rising Sun" public-house on the site of Nos. 54 and 56, York-road, Lambeth, at the corner of Vine-street (Mr. R. Sawyer for Mr. R. H. Barnes).—Refused.

### *Formation of Streets.*

*Lewisham.*—That an order be issued to Mr. J. Lockhead, refusing to sanction the formation or laying out of nine new streets for carriage traffic, and of two new streets for foot traffic, out of Athenlay-road, Ivydale-road, Lewisham (for the Governors of Christ's Hospital).—Agreed.

### *Buildings for the Supply of Electricity.*

*Greenwich.*—A deviation from the plans approved on March 7, 1899, for the construction of a generating-station and works on the north-west side of Blackwall-lane, East Greenwich, so far as relates to the extension of the engine-house (Mr. F. Forbes Glennie for the Blackheath and Greenwich District Electric Light Company, Limited).—Consent.

*Deptford.*—Additions to two furnace chimney-shafts at Stowage Wharf, Deptford (Messrs. R. B. Hilton & Sons for the London Electric Supply Corporation).—Refused.

### *Artisans' Dwellings.*

*Bermondsey.*—That the Council do make an order as follows:—Whereas Mr. J. Moore, of No. 33, Finsbury-square, London, E.C., on May 2, 1899, under the provisions of Section 42 of the London Building Act, 1894, delivered on behalf of the Improved Industrial Dwellings Company, Limited, at the County Hall, plans of a laundry addition on the flat roof of a block of intended dwelling-houses, to be inhabited by persons of the working class, and proposed to be erected, not abutting upon a street, between Waleran-buildings, Old Kent-road, and the garden at the rear of No. 155, Old Kent-road, Bermondsey. . . . Now the Council, in the exercise of its powers under Section 42, of the said Act, but in no way otherwise than under such section, does by this order sanction the said plans.—Agreed.

◆

## THE BUILDING TRADE DISPUTE.

A MEETING of masters in the Lancashire and Cheshire building trades was held at Manchester on the 11th inst. Those present included a deputation from the Yorkshire Employers' Federation. After discussion, it was resolved to recommend the National Association of Master Builders to order a general lock-out of 25 per cent. of all unionists in the building trades of the country as soon as convenient.

On the 12th inst., a conference of the Northern Counties Federation of Building Trade Employers was held at the Grand Hotel, Middlesbrough, Mr. Rankin, of Sunderland, presiding, when it was resolved to recommend the National Association of Master Employers to declare a lock-out of 25 per cent. of the union workmen throughout the country, the same to take effect as soon as practicable after the Birmingham Conference on the 18th inst. The meeting endorsed the action of the Yorkshire Federation in locking out 25 per cent. of their men, and further resolved to recommend the Tyne and Wear masters to refuse the joiners' application for an advance of wages. A deputation was appointed to meet the joiners.

The lock-out of the 25 per cent. of the union men engaged in the various branches of the Sheffield building trade came into operation on Saturday.

The trade unions whose members are engaged in the various departments of the building trade held on the 15th inst.—through their representatives—a conference in Manchester. They had under discussion the question as to the assurances asked for by the National Association of Master Builders of Great Britain and Ireland. The unions represented were the Operative Stonemasons' Society, the House and Ship Painters' Association, the Amalgamated Society of Carpenters and Joiners, the United Operative Plumbers' Association, the Amalgamated Society of House Decorators and Painters, the Operative Bricklayers' Society, the National Association of Operative Plasterers, the General Union of Operative Carpenters and Joiners, the National Amalgamated Society of Operative House and Ship Painters and Decorators, the United Builders' Labourers' Union, the Manchester Unity of Bricklayers, and the Gas Workers' and General Labourers' Union. Mr. W. T. Wilson, the chairman of the Amalgamated Society of Carpenters and Joiners, was elected chairman of the Conference, and Mr. G. B. Cherry, of the Operative Plumbers' Society, was appointed secretary. The Conference sat in private. The following resolution was agreed to.

**"That we condemn in the strongest possible terms the untrue and misleading statements contained in**

---

* Names of applicants are given in brackets. Buildings are new erections unless otherwise stated.

the manifesto issued by the Yorkshire Federation of Master Builders. And as we are of opinion that the points raised by the master builders are not of sufficient importance to justify a lock-out in the building trades, we are prepared to meet the National Association of Master Builders in open conference and discuss the questions at issue."

It is to be hoped that this may lead to a conference betweeen the parties, and that the dispute may soon be brought to an end.

A meeting of the Manchester and Salford Master Builders' Association was held at Manchester on the 16th inst., when delegates were appointed to the conference of Master Builders at Birmingham on the 18th inst. The delegates were not provided with specific instructions as to adopting any particular attitude.

## *COMPETITIONS.*

THE CARTWRIGHT MEMORIAL HALL, BRADFORD.—The Cartwright Memorial Hall Committee met on the 11th inst. at the Bradford Technical College, Alderman T. Speight presiding. The purpose of the meeting was to confer with Mr. John W. Simpson, of London, a member of the firm of architects whose designs for the Cartwright Memorial Hall have been awarded the first premium in the competition recently decided. Eventually it was decided that Messrs. Simpson & Allen's designs and plans should be adopted, and the hall erected in accordance therewith. Mr. Simpson was instructed to proceed with the preparation of the detailed designs and working drawings.

## *ARCHITECTURAL SOCIETIES.*

EDINBURGH ARCHITECTURAL SOCIETY.—On the evening of Wednesday, the 10th instant, the session was brought to a successful conclusion, when a paper on "Furniture" was read by Mr. John Ednie. The styles of furniture in Italy, France, Germany, Spain, and England from the Renaissance downwards were lightly touched upon, choice examples being thrown on the screen. The later periods of English work were then more fully dealt with. The lecturer next went on to discuss the adverse circumstances of furniture production to-day, Commercialism and the state of public taste being the chief drawbacks. The conclusion of the paper was a strong plea for leaving the old styles on which one cannot improve and vindicating ourselves as designers by producing original work. In this connexion examples of what Mr. Ednie termed the "Arts and Crafts" style were shown. In the discussion which followed, these examples of the new style were freely criticised. Mr. A. Lorne Campbell, the President, occupied the chair.

# Correspondence.

*To the Editor of* THE BUILDER.

### ARCHITECTURE A FORGOTTEN ART.

SIR,—Every architect will feel grateful to Mr. Leonard Stokes for calling attention to the scant courtesy meted out to architecture by the President of the Royal Academy, in his speech at the recent dinner. It has occurred to me, however, that architects themselves—or at least those connected with the Royal Academy—may be in a measure responsible for the position. Mr. Leonard Stokes himself realises the impossibility of adequately representing the work of the architect on the walls of Burlington House, and this difficulty, coupled with the fact that the art of architecture is subordinated to the art of *architectural drawing*, makes any allusion to the position or progress of the real art extremely difficult; and this state of things, it seems to me, must exist so long as a poor drawing of a fine piece of work is rejected in favour of a fine drawing of a poor work, and the name of the artist, who in reality caused its acceptance, is suppressed in the catalogue. Under such circumstances, any allusion to the architectural exhibits would seem to entail a rather elaborate dissertation on the exact relation of these exhibits to the real art of architecture outside the Academy.

R. F. CHISHOLM.

*Heidelberg*, May 14, 1899.

## BOOKS RECEIVED.

CONFLAGRATIONS DURING THE LAST TEN YEARS. By C. E. Good (British Fire Prevention Committee).

THE VALUATION OF LAND AND HOUSES. By D. Thos. Davies and Ivor Curtis. (*Estates Gazette* Office).

## *OBITUARY.*

MR. J. E. GOODCHILD.—We announce with regret the death of Mr. John Eastty Goodchild, architect, in the eighty-ninth year of his age. He owed his architectural education to the late Professor Cockerell, with whom he was so intimately connected during nearly the whole of the Professor's career as to be familiarly known to most of the architects of that day, both in London and Liverpool. His own works were chiefly of a private character, including several city buildings, of which the best known is the North British and Mercantile Insurance Offices in Threadneedle-street. In 1888 he compiled and printed for private circulation "A Study of the Halicarnassian Marbles," and in 1889 "A Study of the Marbles from Ephesus," containing his restoration of the Temple of Diana at Ephesus, and in which he pointed out what he considered the errors of the discoverer (Mr. Wood). Between the ages of eighty and eighty-eight he prepared a number of fine drawings of various Greek and Egyptian temples, &c., and was engaged on a set of studies up to within about a week of his death.

## *GENERAL BUILDING NEWS.*

NEW CHURCH, DRIFFIELD.—The foundation-stone of St. John's Church, Driffield, was laid on the 6th inst. Some progress has already been made with the building of the church, which will be constructed principally of brick. The church will consist of a nave and chancel, with transepts. The drawings show a tower at the intersection of the nave and transepts. The chief entrance is on the west facing Beverley-street; double doors will here be provided, and other entrances will be on the north and south aisles, and the vestry will also be approached by an outer door. The church will be capable of seating 419 adult persons; the nave accommodating 276, the north and south aisles and transepts 44 each, the chancel aisle 27, and the chancel 28. The cost of the fabric and the stalls is estimated at about 3,500*l.* Messrs. W. Leason & Son, of Driffield, are the contractors, and the woodwork will be done in the town by Messrs. Shepherdson & Son, Limited. The architects are Messrs. Hicks & Charlewood, of Newcastle-on-Tyne. Mr. Joseph Berry, of Driffield, is the clerk of works.

CRICHTON CHURCH RESTORATION, N.B.—This collegiate church was one of many founded in the fifteenth century by nobles and gentry in the south of Scotland. The restoration, so far as completed, presents it nearly as it was when wrecked by the misdirected zeal of the Reformation mobs. After having remained for three centuries more or less in a ruinous condition, so far as architectural details of doors and windows are concerned, the work of restoration has been heavy. In 1645 the church was constituted the parish church, which was located in the transepts, and in the early part of the present century, owing to the increase of population, the church was rebuilt in the larger area of the choir. The plan comprises choir, tower, and transepts, the nave never having been erected. The church, so far as it has been restored, has all the characteristic features of its architecture complete with the exception of the pinnacles, the east window, and sacristy. The restoration of the interior masonry was heavy work from the great damage done to walls and pillars and arching by the gallery beams, wall-screen fixings, &c. The organ case and organ are erected on the under porch. All woodwork above the floor is in oak, and fumigated. Seating is of the modern design, with moulded bench ends. The roof of the tower has been renewed, the parapet repaired, its windows opened out, and a system of spouting and drainage carried out. The restoration, though not yet complete, has at least succeeded in recreating the original design as far as its masonry is concerned, and for the first time for 300 years after it was dismantled its interior can be seen. The east window and one of the side windows have been filled with memorial designs in stained glass, and a wall-screen at the east window and communion table, from Messrs. Jones & Willis's factory, have been given. The whole of the works have been carried out (from the plans by Messrs. Hardy & Wight, of Edinburgh) by tradesmen in the parish. —*Glasgow Herald.*

BAPTIST CHURCH, HERNE HILL.—The Church Hall erected by the Baptists of Herne Hill at the corner of Winterbrook-road was opened recently. This building will serve the purposes of the church pending the completion of the larger scheme, which includes the erection of a church and a school-room on the adjoining vacant land. The amount of the contract for the erection of the hall was 2,259*l.* The cost of the complete scheme will be 9,000*l.* The building has been erected by Messrs. W. J. Mitchell & Sons, of Dulwich, from the plans of Mr. Charles Barry.

PRIMITIVE METHODIST CHURCH, WEST BROMWICH.—The stone-laying ceremony of a new Primitive Methodist Church, to be built in the Lyng district of West Bromwich, took place on the 8th inst. The new church, to be erected from the plans of Mr. Alfred Long, will cost 4,990*l.* The building, which will accommodate 640 worshippers, is designed in the Early English style, and a feature of the exterior is a square tower, finished with a parapet and pinnacles. The work is being carried out by Mr. John Mullin, of West Bromwich.

RESTORATION OF A CHAPEL IN WORCESTER CATHEDRAL.—The chapel, which has been used as the baptistry, in the north transept of Worcester Cathedral, has been under restoration. The materials of the new altar and reredos have now arrived. The work was designed by Mr. R. A. Briggs, architect, of London, and has been carried out by Messrs. Martyn & Co., of Cheltenham.

RENOVATION OF PARISH CHURCH, AYLESBEARE, NEAR EXETER.—The parish church at Aylesbeare has just been opened after renovation. The nave has been re-roofed, and the north wall set right and supported by buttresses. The gallery has been removed, the west windows and the interior of the tower have been restored, and the east window filled with stained glass, the work of Mr. Drake, of Exeter. Mr. Harbottle, of Exeter, was the architect.

CATHOLIC CHURCH, CROSSGAR, CO. DOWN.—The new church of the Holy Family, Tyconnett, Crossgar, was dedicated on the 14th inst. It has been built by Messrs. Fitzpatrick Brothers, of Belfast, from the designs of Mr. J. J. McDonnell, J.P., architect, of the same city.

CATHOLIC CHURCH, TARMONBARRY, IRELAND.—On the 14th inst. was consecrated the Church of the Sacred Heart, Tarmonbarry. The building consists of chancel, nave, and side chapel, and was erected by Mr. Thomas Fee, of Longford, from the design of Mr. Kilgallon, of Sligo.

CHURCH AT THE LUNATIC ASYLUM, CORK.—On the 10th inst. the new Catholic Church at Cork Lunatic Asylum was consecrated. The church consists of a nave, two aisles, chancel, and side chapel, with sacristy, organ-loft, &c. The building occupies an area of about 120 ft. by 70 ft. The dressings of the doors and windows are of Cork limestone, the walls being of rubble from a local quarry. The building was erected by Mr. Patrick Murphy, of Cork, from the designs of Mr. W. H. Hill.

SUNDAY SCHOOLS, &C., ST. PAUL'S, WEST HARTLEPOOL.—The foundation stone has just been laid of the new Sunday schools, parish hall, and institute in connexion with St. Paul's Church, West Hartlepool. These buildings, which it is estimated will cost about 5,000*l.*, are in course of erection in Murray-street. The accommodation provided for Sunday school purposes is for 1,150 children. Seating accommodation in the hall for other purposes is 600. The buildings contain on the ground floor a hall 82 ft. by 32 ft., having platform and retiring rooms at the south end facing Milton-road, and a gallery at the other end. On either side are class-rooms, on the west side, facing into Milton-road, is an infants' class-room. On the first floor, approached by a separate entrance, is the institute off Murray-street, in which are games-rooms, billiard-room, &c. The buildings are to be faced with Commondale bricks and stone dressings, and Welsh slates, and are intended to be heated by hot water. The contractor is Mr. C. T. Watson, of West Hartlepool. The buildings have been designed and are being carried out under the superintendence of Mr. J. H. Morton, architect, of South Shields.

TECHNICAL SCHOOLS, OLDBURY.—Foundation stones have just been laid of "The Technical Institute Continuation Schools," Oldbury. The buildings are being erected by Mr. J. Dalton, of Blackheath, from plans by Messrs. Wood & Kendrick, architects, of West Bromwich. They comprise, in addition to the room for various science and art classes, workshops for giving manual instruction, a laboratory, lecture theatre, examination, committee, and exhibition rooms, teachers' and secretary's apartments, caretaker's house, &c.

BOARD SCHOOL, NOTTINGHAM.—The Mundella Higher Grade School and School of Science, in the Meadows, Nottingham, was opened on the 29th ult. The school is in two separate blocks, divided into the Higher Grade and Science Department, and the laundry, gymnasium, and dining-rooms. In these, accommodation is provided for 402 girls and 502 boys; whilst in a neighbouring building 230 infants will be accommodated. The front of the Graded school, which is in Mundella-road, is of brick, with yellow terra-cotta dressings. On the ground floor is situate the girls' school; on the first floor is the boys' school; and the laboratories, lecture-room, and drawing-class room occupy the second floor. Entrance to the girls' school has been established on Mundella-road, the managers' entrance being also at this point. The boys and infants will enter their schools from the Collygate-road. There is on the ground floor a girls' assembly hall, which is 64 ft. by 30 ft. 6 in., and is approached from two entrances, and on the same floor is the cookery-room, scullery, and cloak-room. The chemical laboratory, which is on the second floor, is 51 ft. 3 in. by 19 ft. 6 in.; the drawing class-room is 31 ft. by 27 ft. 6 in.; and the lecture-room is of the same dimensions. On the south side of the Graded school, in a separate building, are the gymnasium, the laundry, and separate dining-rooms for girls and boys, provided with cooking ranges. The infants' school in Collygate-road, on the north side of the Graded school, has a central hall, 48 ft. by 27 ft., and has two entrances. Three infants' class-rooms and one "babies'-room" have been provided. All the walls in the interior of the buildings, up to 4 ft. high, are faced with white glazed bricks. Mr. R. C. Clarke, of Nottingham, was the architect, his plans being accepted in competition. The contract for the erection of the schools and outbuildings was entrusted to Mr. Enoch Hind, the clerk of the works being Mr. W. H. Price. The contract for the schools and outbuildings, exclusive of fittings, amounted to 17,146*l.*

ART SCHOOL, BALSALL HEATH, BIRMINGHAM.—The memorial-stone was laid on the 8th inst. of the building which is to serve as a branch school of art for the Balsall Health district of Birmingham. The site is at the corner of Lime-grove and Moseley-road, and has a principal frontage of about 65 ft. A strip, a yard wide, has been given up to the widening of Lime-grove; and the new building, which occupies the front half of the remainder, has been planned with a view to its ultimately covering the whole of the land. The building when complete will present a façade of Classic character to Moseley-road, with the front entrance block advanced 7 ft. in front of the side wings, and crowned with a circular pediment. A large entrance hall will lead through an open colonnade to a stone staircase in the rear, which will readily admit to all parts of the building. Leading directly from the hall there will be rooms for the masters, the curator, and the library. Under the front portion of the building will be a basement to be devoted to modelling and metal work; and on the first floor, over the entrance-hall, a lecture-room will be provided, with an annexe for building construction. The rear portion of the building will consist of three class-rooms for elementary drawing, design, and study of the antique. They will be approached by a corridor running along the central axis of the building, and this will constitute the main artery of communication when the building is extended. The work is being carried out from the designs of Mr. W. H. Bidlake, architect, by Messrs. Smith & Pitts, who are under contract to complete the school by July 31 next, for the sum of 6,602*l.*, minus an allowance of 100*l.* for the old buildings.

PREMISES, GLASGOW.—A ten-story building (100 ft. high from street level and 110 ft. from basement to attics) is to be erected in St. Vincent-street, Glasgow. The building is to be erected by Mr. J. Millar, from the designs of Messrs. James Salmon & Son, architects.

NEW PAROCHIAL HALL, ANFIELD, LIVERPOOL.—On the 10th inst. a new parochial hall and new Sunday schools were opened in connexion with St. Simon and St. Jude's church. The new hall is situated in Watford-road, adjoining the church, and the design was prepared by Mr. Owens, architect. The contractors who had the erection of the structure in hand were Messrs. G. & J. Chappell, of Walton. The building really comprises a Sunday school capable of accommodating about 500 scholars, a parochial hall, and two class-rooms.

HOTEL, SOUTH SHIELDS.—The hotel, "The Britannia," at the corner of Charlotte-terrace and Claypath-lane, South Shields, has just been completed. The principal façade faces Westoe-lane. Internally the building consists of a smoke-room on the right of the main entrance a bar, 34 ft. by 16 ft., on the left, and behind the bar a sitting-room, and a wholesale and outdoor department with a side entrance. On the first floor is situated a billiard-room and a luncheon-room, the dwelling rooms being on the second floor. The architect was Mr. J. Wardle Donald. The general contractor was Mr. Robert Allison, of Whitburn, the other contractors being Messrs. Christie & Sons, slating; Mr. H. Niven, plastering; Messrs. T. Coulson & Son, glazing; ornamental window glass, Mr. Laws; Mr. A. Holme, painting; Messrs. Dagleas & Sons, plumbing; Mr. J. T. Dagleas, electric lighting; and Messrs. Bainbridge & Crimson, iron work; all of South Shields. The granite was supplied by Mr. Robert Beall, of Newcastle.

PAVILION, ASHBROOKE, SUNDERLAND.—A pavilion for the Sunderland Cricket and Football Club was opened recently at Ashbrooke. The building is of red bricks, with a red tiled roof. Mr. J. B. Stott, of Sunderland, was the contractor, the architects being Messrs. James Henderson, jun., and John Hall.

PUBLIC HALL, HALIFAX.—The memorial stone of the new Public Hall at Halifax was laid on the 6th inst. The building is situated at the corner of Commercial-street and Fountain-street, and will accommodate 2,600 persons, the cost, including the site, being about 30,000*l.* The scheme includes the erection of shops and a restaurant. The architect is Mr. W. C. Williams.

DRILL HALL, WARE.—A new drill hall is to be erected at Ware on the site of Dickinson's Yard. The main room will be 108 ft. long and 52 ft. wide. The frontage to the building will be red local brick, with glazed brick plinth and window dressings; the splayed angles and jambs on either side of the entrance will also be of glazed brick. Tenders have been received from five contractors, the lowest being 5,250*l.*, from Messrs. J. Simpson & Son, of Paddington. The architect is Mr. Vivian Young, of Westminster.

WORKHOUSE EXTENSIONS, WITHINGTON, LANCASHIRE.—It is proposed to make some extensions at the Withington Workhouse. Plans have been prepared by Mr. J. B. Broadbent, architect, showing the way in which the ground recently bought by the Guardians from Earl Egerton will be utilised. There will be ultimately eight new hospital pavilions, of three stories each, and as each pavilion will contain ninety beds, the number of additional inmates to be provided for will be 720. The existing pavilions have 630 beds, so that the total accommodation, if the scheme is fully carried out, will be for 1,350 patients. The probability is that the construction of two new pavilions, containing together 180 beds, will meet the requirements of the Union for some time to come. The new pavilions will be of brick, and will be connected on the first and second floors by bridges.

CUSTOM HOUSE, QUEENSTOWN.—The new Custom House at Queenstown has just been completed. The building is constructed of red Ruabon bricks with terra-cotta dressings, and consists of two stories. On the ground floor is a room for the boats, and another fitted up for the use of the boatmen. On the upper floor is the general office. The building, which has cost about 3,000*l.*, was erected by Mr. F. Dolan, under the supervision of Mr. J. J. Fitzpatrick, clerk of works to the Irish Board of Works, from the designs of Mr. T. J. Mallow, the Chief Surveyor to the same Board.

BUSINESS PREMISES, BELFAST.—The block of business premises, for Messrs. Anderson & M'Auley, at the corner of Donegall-place and Castle-street, Belfast, is almost completed. Electric light has been fitted by Messrs. W. T. Coates & Son, who have also supplied the elevators. Messrs. F. Sage & Co., Limited, of London, have executed the shop fittings, the contractors being Messrs. M'Laughlin & Harvey, and the architects Messrs. Young & Mackenzie.

NEW WORKHOUSE, IPSWICH.—The new workhouse at Ipswich has just been opened. The entrance block is under the supervision of the porter and assistant matron. The main buildings are recessed 200 ft. from the side of the Woodbridge-road. They consist of a central administrative block and two pavilions, one for male and the other for female inmates, in the central block being the office and apartments of the Master. The dining hall behind is warmed with hot water. The workhouse is lighted throughout by electricity, generated on the premises. The warming is chiefly by open stoves, but the passages and dining-hall are heated by steam. There is accommodation in the various buildings for 369 paupers. The architects were Messrs. Salter & Adams and Mr. W. Lister Newcombe, whose designs were selected in competition. The tender of Messrs. G. Grimwood & Sons, of Ipswich, was accepted at 25,773*l.* Mr. Cockrill was clerk of works.

NEW SCHOOLS, LLANELLY.—Two schools were opened last week at Llanelly, providing accommodation for 770 children. They are built from plans prepared by Mr. J. B. Morgan, architect, of Llanelly.

PROPOSED TECHNICAL COLLEGE, WIGAN.—It is proposed to erect a technical college for Wigan and district. The site of the structure is situated in Library-street, a new thoroughfare which will form a main artery in the town, and the erection of the buildings will, it is estimated, involve an outlay of close upon 40,000*l.* The plans of Messrs. Briggs & Wolstenholme, of Liverpool and Blackburn were selected in competition.

THEATRE FOR HUDDERSFIELD. — Mr. Frank Matcham, architect, has been commissioned by the Northern Theatres Company, Limited, to design and supervise the erection of the new Grand Theatre at Huddersfield. The site, in Northumberland-street, contains an area of 1,826 square yds.

CONSERVATIVE CLUB, WIGAN.—The foundation-stone has just been laid of a new Conservative Club for St. Andrew Ward, Wigan. The club building will be a two-story building with bay windows. The plans have been prepared by Mr. J. A. Johnson, and the work of erecting the premises has been let to Mr. John Bott.

THE SIR JOHN CASS NEW SCHOOL AND INSTITUTE, ALDGATE.—The Bishop of London (Dr. Creighton) laid the foundation-stone recently of the new school and technical institute in connexion with Sir John Cass's Foundation. The ground floor of the institute provides a large lecture theatre, with accommodation for 225 persons, and four rooms for instruction in arts and crafts. The Board-room and secretary's office will be in close proximity. Upon the first floor there will be fine class-rooms, a library, and a reading-room The second floor comprises a chemical laboratory, a tailor's workshop, and a women's department, including a laundry, a cookery school, and dressmaking-room. Two rooms will be used as an art school, and there will also be a gymnasium. In the basement provision will be made for the building and allied trades. Messrs. Killby & Gayford were the builders, and Mr. A. W. Cooksey was the architect. We illustrated the building in our issue for July 23, 1898.

A NEW HOSPITAL FOR LEEDS.—A new hospital for women is about to be erected in Leeds. The existing building is to be devoted to the treatment of children. There is ample space on which to erect the new structure, the grounds in which the old building stands covering about an acre and a half. Three sides front Woodbine-place, Blundell-street, and Little Woodhouse-street respectively. The plans of the new buildings, which have been prepared by Messrs. Chorley & Connon, Park-row, and adopted by the committee of the institution, comprise an out-patients' department, a hospital for women, and a maternity department. It has been decided, however, to defer the erection of the latter until the building fund reaches larger proportions. The estimated cost of the entire scheme is about 40,000*l.*, and of this the erection of the maternity department would absorb 17,000*l.* The out-patients' department will comprise an entrance-hall, a waiting-hall, an examination-room, and two consultation-rooms, each with ante-room and dressing-room. attached. There will likewise be a dispensary and drug store, accommodation for the hall porter, a room in which perambulators may be placed, and lavatory accommodation. The Women's Hospital will consist of three wards, each with eighteen beds, and four single wards. On each of these three floors there will also be a day-room and a ward scullery. The principal ward will likewise have attached an operating-room, with an anæsthetic-room and recovery-room. A lift sufficiently large to take up a patient and bed will be provided. The ground floor of this department will be occupied by the administrative rooms, including board-room, waiting hall, reception-room, accommodation for the medical staff, the house-surgeon, the matron, and nurses, and the kitchens. The boiler, engine, and laundry, &c., will occupy the basement. The maternity department, occupying the first and second floors of the building devoted to it, will contain four wards, each with four beds, or sixteen in all, and the arrangement will be such that each ward, in case of need, can be isolated. Other necessary accommodation will be provided, including a small isolation hospital, with disinfecting apparatus, a bed lift, and portable baths. The administrative apartments will be on the ground. The plans show that the out-patients' department will be of one story; the women's hospital of four stories, and the maternity department of three.

IMPROVEMENTS, ABBEY MILLS PUMPING STATION.—At the Stratford Town Hall, on the 12th inst., Colonel A. J. Hepper conducted an inquiry on behalf of the Local Government Board, into the application of the West Ham Town Council to borrow 5,500*l.* for the purposes of erecting a boundary wall and to improve the wharf and offices at the Abbey Mills Pumping Station. The Borough Engineer, Mr. Lewis Angell, submitted a plan of the work and explained the scheme.

CATHEDRAL EXTENSION, PERTH.—At a meeting of the Chapter of St. Ninian's Cathedral, Perth, on the 12th inst., the plans of the late Mr. Pearson, R.A., were considered. Some eight firms of builders in England and Scotland have tendered for the work, and it is understood that the tender of Messrs. Fraser & Morton, of Perth, has been accepted. The total estimates amounted to close on 15,000*l.* An order was given to proceed at once with the chapter-house in memory of the late Bishop Charles Wordsworth; with the cloister connecting the chapter-house with the Cathedral; with the structural alterations on the choir; with the new organ chamber to be built abutting on the south transept; and with the internal furnishing, comprising Bishop's throne, canons' stalls, choir stalls, and pulpit, all of carved oak. The cost of this work will be about 10,500*l.*

NEW BANK, PLYMOUTH.—The new banking premises of the Consolidated Bank of Cornwall, Plymouth, were opened this week. The ground floor and basement are planned for the business of the bank, the upper floors being arranged as chambers or offices with a separate entrance at the southern end. The banking room or public office is about 60 ft. by 42 ft. by 20 ft. high. The ceiling is supported by four Scagliola Corinthian columns. The woodwork of the room is entirely of mahogany, except the floor, which is of oak blocks set on concrete. The room will be lit by electric light from seven large pendants from the ceiling, and a number of standards on the desks and counters. The warming is by means of hot water from a boiler in the basement, with ornamental radiators fixed around the walls. The entire ground floor is built with steel joists and concrete, so as to be fireproof. The basement story contains various strong rooms, stationery rooms, deed inspection room, heating chamber and other apartments, and a hydraulic lift is provided for the purpose of taking the books from the banking rooms to the strong rooms. The exterior of the building is of limestone and granite up to the level of the ground floor windows, and above this of Portland stone. The architect is Mr. H. J. Snell, of Plymouth, and the contractors Messrs. Tozer & Son, also of Plymouth.

## *SANITARY AND ENGINEERING NEWS.*

KEW BRIDGE.—In consequence of the agitation made recently by those engaged in the carrying trade on the Thames, above Kew Bridge, on account of the inadequate width and height of the arches of the temporary structures to be erected during the construction of the new bridge, the Joint Committee of the Middlesex and Surrey County Councils have agreed upon a modification of the original plans, involving a cost of 500*l.* The original designs showed for both temporary structures a central opening of 60 ft., with a headway of 14 ft. above Trinity high-water mark, and side arches 40 ft. wide. It is now proposed to give a central working opening of 75 ft., with a headway of 15 ft.

REFUSE DESTRUCTOR, BRIDLINGTON.—A special meeting of the Bridlington Urban Council was held on the 9th inst., when the deputation which earlier in the year went on tour in the North of England visiting refuse destructors submitted their report and recommendations. Mr. Sawdon, in submitting a motion that a refuse destructor be erected within the district, said the deputation recommended the Council to cause a Beaman & Dea's destructor to be procured, and referred to the fact that at Fleetwood, Morecambe, Barrow, Cardiff, and other places similar destructors were being erected. Mr. J. Rennan seconded, and the motion was carried.

## *STAINED GLASS AND DECORATION.*

Memorial Window, St. Michael's Church, Appleby.—A stained glass window, the work of Mr. C. E. Kemp, of London, has just been placed in this church as a memorial to the late Mr. C. P. Colnaghi.

Windows, St. James's Church, Nottingham.—Two stained glass windows have recently been dedicated in this church. Both windows are the work of Messrs. Salisbury & Davies, of London and St. Albans, the masonry having been executed by Mr. Clark, of Lenton.

Windows, St. Stephen's, Hyson Green, Notts.—Two stained glass windows, one in the west end and one in the north-west end of this church, were dedicated on the 11th inst. The west window is divided into two parts. the left half representing the baptism of Christ and the right half the Transfiguration. The north-west window represents the presentation at the Temple. The work has been carried out by Messrs. Thomas Powell & Son, from designs by Mr. W. D. Caröe.

## *FOREIGN.*

France.—On Sunday last, at Père la Chaise, the monument erected by public subscription to Charles Floquet was inaugurated. This monument is by M. Dalou, the architectural part having been designed by M. Formigé. Before a column supporting the bust of Floquet is a tribune on which are flowers and palms. On the steps which lead up to it is an allegorical figure of the Republic, who is placing a crown on the tribune.——The work of rebuilding the fountain of Chatelet, has just been commenced. It was the work of Bralle and was built in 1806. M. Blanchard, sculptor, has been commissioned to remake the four decorative figures by Boizet, which represent Law, Force, Prudence, and Vigilance.——A bust of Racine has just been inaugurated at the Port Royal des Champs. The work is by M. Jean Féra.——Last Sunday, at Montdidier, a new Hotel de Ville was inaugurated. It is by M. Schmith, architect. The style of the building is in the Louis XV. age, and the sculptures are the work of M. Lucien Pallez.——M. de Saint Marceau has just submitted a model for the monument of Alexandre Dumas *fils*, which is to be erected on the Place Malesherbes, where the statue to the Dumas père, by Gustave Doré, already stands. This monument will consist of three figures, Dumas *fils* and two allegorical figures, one representing "Theâtre" and the other "Feminism," of which the great author was an apostle.——A Palais de Beaux Arts is to be built at Nice to enable them to have a permanent exhibition there.——In September the monument will be inaugurated at Chantilly in memory of the Duc d'Aumale. The equestrian statue is by Gerome, the pedestal by M. Daumet, member of the Institute. It will be decorated by bronze bas reliefs by M. Gerome. The whole monument will be 8 mètres high.——The Congress of the Société Archeologique Française will be held this year at Macon from the 14th to the 21st June.——The Government has just opened a competition for the designs for the diplomas to be given in the 1900 Exhibition. The sketches will have to be sent in on the 15th June, the Exhibition will be held from the 18th to the 25th June.

Bulawayo.—New buildings have just been erected at Bulawayo for the Mashonaland Agency. The new buildings are situate at the corner of Main-street and Sixth-avenue. Besides numerous suites of offices, they contain the High Court and telegraph office. The architect is Mr. W. Douslin, of Bulawayo. The building has a frontage on Main-street of 207 ft. and 100 ft. on Sixth-avenue. The material used is red and white freestone, quarried at Thabas Induna. The main building in Main-street is entered by a broad flight of steps leading into a large hall or vestibule, from which wide passages run to the different offices on the ground floor. A main staircase, constructed of native and Indian teak, leads to the upper floor. The fittings of the High Court and telegraph offices are made of the same woods. A most ingenious contrivance is provided for dealing with those destructive pests, the white ants. An air passage runs close to the foundations of all the inside and outside walls of the building. Trap-doors leading into this are placed at intervals where sulphur is burnt and the traps closed. The fumes from the burning sulphur are carried round the walls throughout the ground floor. This contrivance is in addition to the usual ones adopted. The portion of the building facing Main-street is divided into suites of offices of various sizes. One of the chief features is that each suite is provided with a large main office, and smaller private offices adjoining. The total cost of the building complete was 30,000*l.*—*South Africa.*

## *MISCELLANEOUS.*

Building Trades Exhibition.—In our notice of awards in the Smoke Prevention Department of this exhibition, the firm given as "Domestic Grates Co." should have been "Domestic Crater Co."

Court of Common Council.—At the meeting of the Court of Common Council on the 11th inst., the Finance and Improvement Committee submitted for approval a plan for making Lower Thames-street 60 ft. wide between Botolph-lane and Fish-street-hill, at an estimated cost of 199,000*l.*, towards which the London County Council had agreed to contribute 50,000*l.* The report was carried.—The Streets Committee submitted a further report on the question of the electric lighting contracts with the City of London Electric Lighting Company, which, in counsel's opinion, are null and void. It was resolved to authorise the committee to have a conference with the directors of the company. and to report to the committee the result.—On the motion of Mr. W. Cooper it was resolved to make an annual allowance of 500*l.* for the purchase of paintings or drawings to be exhibited in the Corporation Art Gallery at Guildhall.

Jerry Building in Sheffield.—At a recent meeting of the Sheffield City Council, Mr. Howell asked the Chairman of the Highway Committee whether the Highway Committee is taking any, and what steps, to put a stop to jerry building? Whether the committee will prosecute in some cases to endeavour to put down the evil? What steps are being taken with regard to the jerry-built property in Hangingwater-road. Mr. Furness, in reply, said the highway department was doing all it possibly could by means of four building inspectors to secure observance of the building by-law in the erection of all new property. The committee would continue to order prosecutions in all cases of infringements of the by-laws. At present their powers were limited to securing stability of buildings, the prevention of fire, and for purpose of health in the way of ventilation, air space, and drainage.—Mr. Charles Hobson presided over the usual monthly meeting of the Sheffield Federated Trades Council on the 12th inst. Mr. Shaw moved the following resolution :—"In the opinion of this Council the building by-laws of the city require to be more strictly enforced; we also consider that many important amendments are necessary to enable the Highways Committee to see that the citizens of Sheffield are provided with good, healthy houses; it is with great alarm we view the liberty allowed to speculating builders who are rapidly changing the picturesque suburbs of the city into dreary, unsightly, and insanitary slums." He remarked that the manner in which jerry buildings were being thrown together in all directions showed conclusively that the by-laws were not strictly enforced. He was told that the Highways Department was very much understaffed. He was certainly of opinion that more building inspectors were wanted, so that the work going on in the city could be more carefully watched. It was said that if they had better houses they would have to pay more rent. Better far that they should pay a little more rent than that they should suffer from sickness as a result of badly built and unhealthy houses. Sheffield has some of the most beautiful suburbs of any town in the kingdom, but those were all being spoilt by buildings which were a disgrace to the city. Mr. J. Bailey Howard seconded the resolution. The sanitary inspectors reported numerous cases of breaches of by-laws, which received no attention. Mr. J. C. Whiteley thought there should be in connexion with the Corporation a Works Department, apart from the Highway Department, so that such matters as building could receive much better attention. The resolution was carried.

West of England and South Wales Federation of Building Trade Employers.—On the 9th inst. the annual meeting of the West of England and South Wales Federation of Building Trade Employers was held at the Royal Hotel, Cardiff. There were present Mr. W. Symonds, of Cardiff, who presided; Messrs. A. Krauss, W. Church, George Humphreys, and F. N. Cowlin, Bristol; C. H. Long, E. J. B. Mercer, W. Webb, E. W. Wooster, and S. Ambrose, Bath; W. M. Blackburn and J. Linton, Newport; R. A. English, Stroud; J. E. Turner, D. Davies, A. J. Howell, and Holloway, Cardiff; F. J. Mingo and G. Herbert, Exeter; E. B. Turpin, A. N. Coles, and W. G. Lapthorn, Plymouth; M. Julian, Pontypridd; W. F. Drew, Chalford; A. W. Hook, Brimscombe; W. Lewis, Hereford; and H. J. Spear, secretary, Bristol. The President gave a hearty welcome to members of the Federation to the town of Cardiff, and then moved the adoption of the report. Mr. W. Church seconded the resolution, which was carried, and it was resolved that the report be printed and circulated among the members of the Federation. Mr. J. Linton presented the financial statement, which was adopted. On the motion of Mr. F. Cowlin, seconded by Mr. Blackburn, Mr. S. Ambrose, of Bath, was elected President. Mr. G. Humphreys proposed, and Mr. Lapthorn seconded, a vote of thanks to Mr. Symonds for the admirable manner in which he had conducted the business of the Federation during the last twelve months. This was carried by acclamation. Mr. Lewis moved, and Mr. Linton seconded, that Mr. Lapthorn be chosen vice-president, which was agreed to. The re-election of Mr. J. Linthorn as treasurer, on the motion of Mr. Long, seconded by Mr. Turner, followed. Messrs. E. J. B. Mercer, Bath, and C. Harris, Bridgwater, were re-elected auditors on the proposition of Mr. English, seconded by Mr. Blackburn. The question of the action taken by the Council of the county borough of Cardiff was introduced by Mr. A. Krauss, of Bristol, and he made some remarks relative to the subject. He then submitted the following proposition :—"That this meeting of the West of England and South Wales' Master Builders' Federation is of opinion that the action of the Cardiff Council with respect to the building trade dispute is a most dangerous precedent, and, having in view the fact that already there exists a fair wage clause compelling all County Council contractors to pay the full trade union rate of wages as agreed between the two respective parties, is an undue interference between employers and their workmen." Mr. Long seconded the proposition, and a discussion ensued, in which the difficulties of the position were explained. Mr. J. Linton referred to what had been done by the Newport Corporation, and said that this body was in accord with the Master Builders' Association of the town. The resolution was eventually carried, and it was resolved, on the motion of Mr. W. Church, of Bristol, seconded by Mr. E. B. Turpin, that a copy of the foregoing proposition be addressed to the town clerk of Cardiff. Mr. F. N. Cowlin introduced the question of the formation of a Builders' Foremen's and Clerks of Works' Association, and submitted a draft scheme which was adopted by the Lancashire Federation. He strongly urged the West of England and South Wales Federation to adopt a similar scheme, as he believed there was only one town in which such an association existed, namely, Bristol. He then proposed that a copy of a scheme should be forwarded to each association in Federation. Mr. W. M. Blackburn seconded the resolution, which was adopted, and this brought the business to a close. In the evening there was a dinner at the Royal Hotel, under the presidency of Mr. J. E. Turner, of the Cardiff Association. Mr. Long (Bath) proposed "The West of England and South Wales Federation." He considered they should hope for success in their movement, and not be discouraged by the work done up to now, as he felt that great results would be attained by the Federation. Mr. Symonds responded. He thought the Federation had not done a great work, but it had done a good and useful work, and whatever small failures there might have been they must persevere. The time had come when capital and labour must be affiliated; they must meet combination by combination, or else they would be a scattered flock. As to their local difficulty he did not think if the Cardiff Council knew what the real facts of the case were they would have acted as they had done. Mr. F. N. Cowlin proposed "Cardiff Master Builders' Association." He considered that they must acknowledge the part that Cardiff had played in the formation of the Federation, and the plucky determination in which the Cardiff Builders' Association had carried through their great strike. Mr. Turner, in acknowledging the toast, stated that he was sorry they could not have received the Federation in Cardiff at a more prosperous time. They did not know what the dispute with the masons would result in, but the employers would meet the men in a conciliatory manner. Mr. A. Krauss, in submitting "The Visitors," said he found in Cardiff that the tenders of local men were accepted, and that he did not complain of, but if they followed out that practice they must not be surprised if the rates went up. Mr. Ambrose returned thanks, and subsequently the health of the chairman was drunk on the proposition of Mr. Lewis.

Interesting Discovery at Bakewell Church.—The west front of Bakewell Parish Church is being restored, mainly with a view to the reopening of the fine Norman doorway at this end of the church. During the excavations the workmen laid bare the foundations thought to belong to a small western tower at the end of the south aisle, into which the arch behind the font originally opened in the eleventh century. Exact measurements were taken before the foundations were again filled in to be covered by the new pathway. It was conjectured that a similar foundation might be found on the north side of the doorway. This proved to be the case, for, on the 13th inst., the workmen exposed to view the foundations of another tower of almost precisely the same design and dimensions, but in a much better state of preservation. Although probably buried for centuries, the masonry still shows the chisel marks of the old Norman workmen, and the work, undoubtedly, belongs to the Norman period. Three steps are still existent.—*Nottingham Guardian.*

The Institute of Sanitary Engineers.—On Wednesday, the 10th inst., by invitation of the President, Mr. R. Reynolds Rowe, F.R.I.B.A., M.Inst.C.E., &c., a party of members of this Institute and their friends visited Ely and the neighbourhood.

On arriving at Ely the party was entertained to luncheon by the President, and afterwards conducted over the cathedral by him in his capacity as clerk of the works. They explored the building from the ground level to the leaden roof of the octagon lantern, as also the outlying buildings, "watch hill," &c., and a great deal of interesting information was given by Mr. Rowe.

THE SANITARY INSTITUTE.—At an examination in practical sanitary science, held in London on May 5 and 6, the following three candidates were granted certificates in practical sanitary science :—C. Barker, Bromley, Kent ; E. G. Browning, Bethnal Green ; and J. de Lanoy Dunk, Folkestone.

FONT AND LECTERN, ST. MARY'S CHURCH, ARNOLD, NOTTS.—On the 10th inst. a new font and lectern were dedicated in this church. The font is of Caen stone, and is octagonal in shape, the bowl being supported at the angles by four columns of red Ogwell marble with a centre shaft of stone. It was executed by Messrs. Jones & Willis, of Birmingham. The lectern, which is of British oak, was the work of Messrs. Harry Hems & Sons, of Exeter. The floor of the baptistry has been tiled in black and white Minton tiles by Messrs. Foss & Son, of Nottingham.

ABERDEEN BUILDING TRADES FEDERATION.—The fourth annual report states that the question as to raising the contributions to provide a strike fund, which was under discussion when last report was issued, did not result in any change being made in the constitution, some of the trades never having reported any decision on the matter. An effort was made to get the two trades which had never been connected with the Federation, viz., the masons and plasterers, to join, the result of which was that the plasterers became affiliated, but the masons again declined to do so, and it appears there is little probability of their becoming part of the Federation so long as the existing arrangement between their Union and the employers is continued. Relating to the "Contract's Clause" in schedules for Town, Council and School Board work, the question was raised as to whether or not an employer, holding such contracts, was bound to pay the standard rate to all in his employment or only to those engaged in that particular contract. After inquiry the Federation was convinced that the employers carrying out contracts for the Corporation or School Board were under obligation to pay all their employés the standard rate. A question of demarcation of work between plumbers and slaters, which had been periodically before the Federation for a considerable time, was at length disposed of. The decision, which was largely in favour of the plumbers on the points raised, did not meet with the approval of the slaters, who immediately thereafter withdrew their delegates. This result was much deplored, but, according to rule, the Federation had to decide the question and did so, to the best of their belief, in accordance with the evidence. During the year two conferences of building trade workers have been held under the auspices of the Federation, the whole of the trades in the building group being represented. The building trade continues very brisk and wages are still moving upwards. Most of the building trades in the city agitated for an advance of wages this spring, and, at the time of writing, all have succeeded in gaining increased pay except the masons, but there is reason to believe a settlement in favour of the men will be arrived at shortly. The joiners and painters were both a week on strike before their demands were granted.

REREDOS, HOLY TRINITY CHURCH, WESTWARD HO.—An oak reredos has just been placed in this church. In width it is the same as the east window, under which it has been fixed. The work was executed by Messrs. Harry Hems & Sons, of Exeter.

SALES OF BUILDING SITES IN THE CITY.—The fine position now occupied by the Lady Holle's Girls' School at the end of Fore-street, City, and by a branch of the City and Midland Bank, has just been sold by Messrs. Feltham, Woodrow, & Co. to the London County Council for 31,000*l.*, as a site upon which to build a new fire station commanding the district where the great Cripplegate fire took place in 1897. Last week also Messrs. David Burnett & Co. (in conjunction with Messrs. Feltham, Woodrow, & Co.) sold No. 54, Cheapside, a fine position in the heart of the City, for 28,500*l.*

THE NEW WAR OFFICE.—In the House of Lords on the 12th inst., the Marquis of Lothian asked her Majesty's Government whether they would cause a model of the proposed new buildings for the War Office to be made and placed in the precincts of the House for the inspection of members of both Houses of Parliament. The noble lord said he had no intention of detaining the House by going into the general question. The necessity of having such a model as he suggested was shown by what happened in the case of the new Admiralty. When a model was produced of the plan first accepted it was found that the proposed buildings would be such monstrosities that an entirely new plan had to be resorted to ; and the present Admiralty buildings were absolutely unworthy of the office they had to house. The architecture was weak where it ought to be strong, and there was at the top of the building a sort of trimming which appeared to be taken out of a child's box of bricks. When the new Admiralty was finished, it would not be large enough for its purpose, and it would be necessary either to add another story or to provide a fresh building elsewhere.—The Earl of Pembroke said he was afraid he could not give much comfort to his noble friend. The First Commissioner of Works did not see his way to grant the request with respect to a model of the new buildings. At the same time—as, perhaps, the noble lord was aware—the plans and elevations of these proposed new buildings had been in the tea-room of the House of Commons for some time, and he was quite sure that his right hon. friend would be glad to show them to any noble lord who took an interest in the matter. With respect to the present new Admiralty, one must remind his noble friend that that magnificent edifice was the result of a Committee of the House of Commons. This did not encourage his right hon. friend to carry on the same procedure with respect to the further buildings to be erected as was done in the case of the Admiralty. The Marquis of Lothian said the plans and elevations were absolutely no use for the purpose.

◆

## *CAPITAL AND LABOUR.*

THE JOINERS' STRIKE AT ST. ANNES-ON-THE-SEA.—The strike of joiners at St. Annes-on-the-Sea was settled on the 10th inst. Six months ago the men gave notice of a demand for an increase from 8d. to 9d. per hour. The masters made no response, and the men came out on May 1. The employers and men have met, and an advance to 8¼d. has been conceded, and 8½d. on August 1. A new set of rules has also been agreed to.

THE DISPUTE IN THE BELFAST BUILDING TRADE.—The carpenters and joiners affected by the strike which opened on the 1st inst. returned to work on the 8th inst. The dispute arose from a demand on the part of the employers for the alteration of the existing rules. As a result of the settlement arrived at, the conditions of employment hitherto observed will be adhered to, with the alteration that the limit within which certain allowances are made will be extended by half a mile.

THE BUILDING DISPUTE AT WOLVERHAMPTON.—In connexion with the building dispute at Wolverhampton, there has been an abrupt termination of the strike consequent upon the masters agreeing to the demand. On Friday last week, Mr. H. Gough, one of Wolverhampton's largest contractors, gave an undertaking to pay the advanced rate to the labourers viz., 6d. per hour. Mr. Gough is carrying out the contract of Messrs. Chubb & Sons for the erection of their new works in Wolverhampton. The day previous to this undertaking being given about 150 men were out, and at least sixty of them were affected by the decision of Mr. Gough. The other master builders of the town at once called a meeting, which was held in the Star and Garter Hotel, Wolverhampton. Mr. T. Skett (President of the Wolverhampton Branch of the National Association of Master Builders) occupied the chair. Eventually the following resolution was passed :—"That this meeting of the master builders of Wolverhampton and district expresses surprise at the action taken by Mr. H. Gough in writing privately to the labourers conceding their demand, after being the strongest opponent to do so at the meeting held on the 4th inst. ; and that we, after this action, are pleased to grant the advance asked for." Most of the labourers have resumed work.

WOLVERHAMPTON PLUMBERS' DISPUTE.—The application made by the plumbers of Wolverhampton for an advance of ½d. per hour has been considered by the Master Builders' Association and refused. At the present time the supply in the plumbing line is greater than the demand. For the past few days there has been no great change in the position of affairs. The men sent a request to the master builders that they should receive a deputation, but no reply to the communication has been received. With regard to the code of working rules that the men are asking for in addition to the advance, they state that these are merely what have been in force previously between themselves and the master plumbers. The master builders state that they have not yet considered the matter.

STRIKE OF BRICKLAYERS' LABOURERS AT ELVEDON, SUFFOLK.—The general labourers on the building works going on at Elvedon, have struck for an advance of ½d. per hour.

CHELTENHAM CARPENTERS' STRIKE.—The differences between the employers and the men at Cheltenham have been arranged in a satisfactory manner. Before the intervention of the Mayor, matters were at a hopeless deadlock, neither side being disposed to give way. At a meeting called by the Mayor the following propositions were agreed upon : That the wages shall be 7½d. per hour from this date, the men returning to work forthwith at this rate ; that on and after January 1 next (January 1, 1900), the rate of wages shall be 8d. per hour ; that the notice on either side shall be two hours, instead of one as at present ; that the same men shall be taken into their old places as far as practicable ; that it is agreed by the men that the question of an umpire is dispensed with. This was signed on behalf of the employers by Mr. A. C. Billings, and on behalf of the workmen by Mr. J. Grimes (A.S.) and Mr. C. Evans (G.U.). The Mayor also affixed his signature and certified the correctness of the terms set down. A meeting of the men was held afterwards, when the arrangements made were approved.

THE NORWICH BUILDING TRADE.—We understand that conciliatory relations still prevail as between the members of the Norwich and District Master Builders' Association and the carpenters, bricklayers, and labourers whom they employ. The carpenters, it will be remembered, ask for 7½d. an hour all round, but as most of them already are paid at that rate, it is not expected that any insuperable difficulty will arise in that quarter. The labourers are the chief element of trouble. They ask for an increase of one penny an hour all round. The masters are willing to grant a half-penny to the men whom they consider capable, but not to just any man who may have been employed as a labourer. They point out that there are various degrees of capacity in a bricklayer's labourer, and that while some are capable of mixing hair mortar and doing other things requiring experience more or less, there are others, as for instance, certain men who were displaced by the recent shoe strike, who are capable of little or nothing but to carry bricks in a hod up a ladder. The contention of the men is that the masters ought not to discriminate between labourers who have been admitted to membership of the union.—*Eastern Daily Press.*

BUILDING STRIKE, LOWESTOFT.—The bricklayers, labourers, and scaffolders employed by Johnson & Co., of Wandsworth, London, in the erection of the Empire Hotel, Kirkley Cliff, came out on strike on the 12th inst. The demand of the men is for an increase of a penny an hour. They are now receiving the following rates : Bricklayers, 8d. per hour ; labourers, 6d.

THE GATESHEAD BUILDING TRADE.—On Thursday last week, the Gateshead Master Builders held a meeting and agreed to make an offer to have the dispute with the labourers settled by arbitration. The lock-out—which affects between 150 and 200 men—arose out of a demand by the men for an advance of from 6½d. to 7d. per hour. The men have been locked out since the end of March, and many have obtained employment elsewhere.

ROTHERHAM BUILDING TRADE.—The position of affairs in the Rotherham building trade is assuming a serious aspect. The masons, some seventy in number, ceased work at the end of April in consequence of the refusal of the employers to concede 1d. and 1½d. per hour—according to class of labour—advance in wages. It is understood that the decision of the Sheffield builders is awaited, and that the two places will act together. The bricklayers are now making a movement. The stoppage of the masons has led to the non-employment of a number of labourers, and it is expected that all the other branches of the trade will be affected.

BUILDING TRADE DISPUTE, YORK.—A meeting of the York Master Builders' Association was held recently, when it was decided to comply with the request of the Federation and lock out 25 per cent. of the men of all trades on the 27th inst.

QUARRY DISPUTE IN BRISTOL.—The dispute in the quarry industry in Bristol does not seem to be any nearer a settlement than it was two or three months ago. In November last a letter was sent to the quarry owners of Bristol and district from the Gasworkers' and General Labourers' Union, enclosing a copy of suggested new rules. In this letter the firms were asked to make any suggestions as to alterations they might think desirable, with an assurance that any such suggestions would receive the fullest consideration. It was also hoped that a final arrangement would be made by January 30, 1899. The desire of the society was to get a code of working rules in definite form with a standard rate of wages, which was duly formulated, and which would have meant, generally speaking, an advance of ½d. an hour for the labourers only. The rules also aimed at the partial abolition of piecework. Several employers signed these new rules, but there are over 100 men out of employment.

THE BUILDING DISPUTE, HULL.—The men in Hull affected by the dispute in the building trade are, it is stated, so firm in their intention not to give way that there has been quite an exodus from the city. Out of 550 joiners affected no less than 350 have been found employment elsewhere. Bricklayers have also been departing rapidly. The question of the completion of the Corporate contracts has been under the consideration of the Joint Committee of bricklayers, plasterers, joiners, and builders' labourers, when the following resolution was unanimously passed :—"That in the event of the Corporation deciding to do their own work by employing workmen direct, we have no objection to the same, and will be prepared to actively co-operate with them to complete the work by supplying all the men they need. But under no circumstances are we prepared to advise our men to work for the Corporation should the contractor have any further control of the work from which our men have been locked out."

THE BUILDING TRADE DISPUTE, LEICESTER.—Leicester builders report that they are getting over their troubles much better than was at first anticipated, owing to the excellent substitutes they have been able to put in the places of the men now compulsorily idle. Few of them are now short of good plasterers, who have come over from Dublin and other places in Ireland, and have not only proved themselves to be in every respect capable and trustworthy workmen, but have expressed satisfaction with the treatment they are receiving. Some of the men have brought their wives and families with them, and all have expressed their willingness to remain in the town. With regard to a supply of labourers, there have been many applications from the Eastern counties. Leicester builders are not, therefore, so badly handicapped by the dispute as was at one time feared, and whilst remaining loyal to their Federation, they can afford to treat the position of affairs with equanimity.—*Leicester Post.*

## *LEGAL.*

### ACTION ON BEHALF OF A BUILDER AGAINST A SOLICITOR.

THE case of Field *v.* Jessop came before the Court of Appeal, composed of the Master of the Rolls and the Lord Justices Rigby and Collins, on the 9th and 11th inst. on the appeal of the plaintiff from the judgment of Mr. Justice Kekewich in the Chancery Division, giving judgment for the defendant.

Mr. Renshaw, Q.C., and Mr. Jessel appeared for the appellant, and Mr. Warrington, Q.C., and Mr. Christopher James for the respondent.

Mr. Renshaw stated that the action was brought by the trustee in bankruptcy of a builder named Mackintosh, who carried on a business at Bedford, against the defendant, Mr. W. B. Jessop, a solicitor in partnership with his father at Bedford under the style of Jessop & Son, to recover the excess value of a house built by Mackintosh for the defendant under a contract at a price which was totally inadequate. The learned counsel said that the defendant had acted prior to that date when the contract was entered into as solicitor for Mackintosh, and had financed him in his building operations, and the allegation was that he had obtained from Mackintosh, by virtue of his position, a contract by which Mackintosh built a house for him at a gross undervalue. At the time when the contract was entered into in 1894, Mackintosh was a young man, he having been born in 1872. Mackintosh had been educated as a civil engineer, and in 1893 he went to Bedford, having in his pocket a capital of about 680*l.*, and he conceived the idea of setting up business at that place as a builder. In February, 1894, Mackintosh bought three plots of land on the Queen's Park estate at Bedford, and employed Messrs. Jessop & Son as his solicitors on that transaction, and the defendant acted for him. In February, 1894, Mackintosh bought another plot of land on the St. Peter's Glebe estate, and in March, 1894, he built a house in which his mother afterwards resided. Under the advice of the defendant Mackintosh bought another piece of land on a building estate adjoining the St. Peter's Glebe estate. By April or May, 1894, he had spent his 680*l.*, but by realising a reversion and some other small property which he had inherited he obtained another 650*l.* After that date Mr. Jessop began financing him for the purposes of his building, and the amount of the advances was considerable. On May 19, 1894, he contracted to sell a house he had built to a man named Cromarty for 1,150*l.* In that transaction the defendant acted as solicitor for Mackintosh, and soon after Jessop asked Mackintosh what would be the cost of a similar house to that sold to Cromarty in materials and labour. Mackintosh, being young and inexperienced, said that, as he had not quite finished Cromarty's house, he did not quite know, but said probably 600*l.* or 700*l.* About a fortnight after this time the defendant suggested to Mackintosh that he should build him a house on land which he had got in Park-avenue, and that he should build it for 600*l.*, the house to be similar to that sold to Cromarty. The foundations were already put in, as a man named Smith had entered into a contract with Jessop to build him a house, but after putting in the foundations he threw the contract up and went away. Mackintosh said that he could not build such a house for 600*l.* Interviews followed between Jessop and Mackintosh, when Jessop held out inducements to Mackintosh to build the house for that sum. He said it would be a good advertisement for him and promised to charge him no law costs, and to employ him on a building estate he (Jessop) had and so on. Jessop then got Mackintosh to bring him the plan and specifications of Cromarty's house, which was the house to be imitated, and he adapted these and to some extent moulded them into the terms of Smith's contract, which had proved abortive the previous year. The contract with Smith was for 1,150*l.*, but it was fair to say that it was not of the same kind of house as that Jessop now proposed to have. Jessop then told Mackintosh to get his own architect to prepare the plans under lines suggested, and the defendant at the same time copied out the specifications and the contract. Mackintosh asked for a quantity surveyor to be employed to take out the quantities, but this Jessop refused to allow. Mackintosh then asked that an architect should be employed by Jessop, but he would not do that. On July 7, 1894, Mackintosh was induced to sign the contract to build the house for 700*l.* By the contract Mackintosh was to build the house according to the specifications and plans, "or to be hereafter specified or required in explanatory instructions." Two days later Mackintosh got frightened at what he had done, and went to the defendant and asked him to release him from the contract, but this the defendant refused to do. The consequence was that Mackintosh had to build the house. The house was finished, and on July 2, 1895, Mr. Turnbull, the architect employed by the defendant wrote and certified that the work was "first-class." The settlement between the parties took place on July 28 or 29, and on that day the account was signed and passed, the extras coming to 77*l.* 8s. 11d. Immediately the defendant got the house built he let it for 100*l.* a year. In November, 1895, Mackintosh got into financial difficulties, and in January, 1896, he was adjudicated a bankrupt, the present plaintiff being the trustee in his bankruptcy. The learned counsel said that the evidence called on behalf of the plaintiff in the court below was that if the house in question had been constructed and paid for by measure, the actual cost without profits would have been 1,136*l.*, with profits at the ordinary 10 per cent., 1,282*l.* The defendant only called one witness on this part of the case, and he said that at cost price and no profit the house would cost 911*l.* The learned counsel said that the result was that Jessop had got from his client the extra value of the house over and above—about 750*l.*—and he submitted that, having regard to the relationship of solicitor and client which existed between them, the defendant was not entitled to retain that advantage to the detriment of the bankrupt's estate.

Mr. Warrington having addressed the Court on behalf of the defendant,

Their Lordships held that the defendant had acted quite properly throughout, and dismissed the appeal with costs.

---

### IMPORTANT POINT UNDER THE WORKMEN'S COMPENSATION ACT.

THE case of Edwards *v.* Godfrey came before the Court of Appeal, composed of Lords Justices A. L. Smith, Vaughan Williams, and Romer, on the 13th inst., on the appeal of Mr. Godfrey from an award of the Judge of the Wandsworth County Court, upon proceedings to assess compensation under the Workmen's Compensation Act, 1897. It appeared that the respondent on the appeal, Edwards, was in the employment of Godfrey on a building over 30 ft. in height, upon the top story of which a studio was being erected. A scaffolding was being used in carrying out the work. The respondent was employed in glazing the studio, and on September 12, 1898, he was descending from the outside of the studio when he fell to the ground and was injured. Edwards then brought an action against Godfrey in the Wandsworth County Court, under the Employers' Liability Act, 1880, the action being tried on January 9, 1899, when the jury found that Edwards was guilty of contributory negligence, and judgment was given for Godfrey. No application was then made on behalf of Edwards to assess compensation under the Workmen's Compensation Act, 1897. On January 30, 1899, Edwards took proceedings to recover compensation under the Act of 1897, and on March 13 the County Court Judge made an award in his favour, and awarded him as compensation 11s. a week.

Mr. Frank Gover, for the appellant Godfrey, contended that by Section 1, Sub-section 2 (b), and Sub-section 4 of the Workmen's Compensation Act, 1897, the workman could claim compensation either under the Employers' Liability Act, 1880, or under the Act of 1897. He could not take two independent proceedings. By Section 1, Sub-section 4 of the Act of 1897, if an action was brought to recover damages independently of that Act, and the action was dismissed, the court might, if the plaintiff chose, proceed to assess compensation under the Act of 1897, and might deduct from such compensation the costs caused by the plaintiff having brought the action under the Employers' Liability Act, 1880. That was in favour of the workman, and if he did not apply for compensation to be then assessed under the Act of 1897, he could not subsequently take proceedings under that Act.

Mr. Colam having argued on behalf of the respondent Edwards in support of the County Court Judge's finding,

Their Lordships allowed the appeal, Lord Justice Smith stating that the question was whether the workman, after having exercised his option of suing under the Act of 1880, could rebut back to the Act of 1897. In his opinion, Section 1, Sub-section 2 (b) of the Act of 1897 gave the workman in the circumstances there mentioned the option of claiming compensation independently of the Act or under the Act. The workman in the present case had excused his option of claiming independently of the Act. If it had not been for Section 1, Sub-section 4 of the Act the matter would then have been *res judicata.* But that sub-section gave the workman the advantage when he had wrongly exercised his option of proceeding independently of the Act and had failed, of having compensation then and there assessed under the Act of 1897 by the court which had *seisin* of the case. At the same time a benefit was given to the employer by allowing the Judge to deduct from the compensation awarded the costs caused by the workman having wrongly brought the action.

The other Lords Justices concurred.

---

### SHOULD "CRIPPLES" BE NAILED?

AT Brompton County Court on Monday, before Judge Stonor, Henry Blackman, a bricklayer, 76, Tonsley Hill, Wandsworth, London, S.W., sought to recover compensation under the Employers' Liability Act from Mr. Charles Wall, builder and contractor, Chelsea, S.W.

Mr. Colam was counsel for the plaintiff, and Mr. Clavel Salter, counsel, defended.

The plaintiff stated that on November 1 last, according to the directions of the defendant's foreman, he was working upon the hip and valley roof of a mortuary which was being erected by the defendant near Dartford. In order to get to the higher portions of the roof, it was necessary to have "cripples"—triangular frames—to hold the scaffold boards upon which the men worked. As there was a return roof, it was not possible to get the "cripples" within about 3 ft. or 4 ft. of the end of the roof at the top, and so the boards hung over beyond the "cripples" more than 3 ft. While the plaintiff was working upon the overhanging boards, they suddenly tipped up, and in saving himself from falling, he knocked the back of his hand against the slate battens. Through this blow his wrist was severely injured. He was unable to go back to work until February 1 last, and still felt pain and weakness in his wrist. His wages had been a little over 2*l.* a week.

The boards were not nailed to the "cripples," but he did not examine them before he went upon them. He maintained that it was not sufficient that the top and bottom boards should be nailed to the "cripples"; all the boards should be so nailed.

Dr. Williams, Wandsworth, stated that he had attended the plaintiff, and found him suffering from inflammation of the sheath of the tendons in the wrist. He considered that the man was not able to resume his work until February 1, and in his opinion there is a slight but permanent stiffening of the wrist.

Other bricklayers were called. Some thought it unnecessary to nail the boards; others said the usual thing was to nail the top and bottom boards, and the remainder said that all the boards should be nailed to the "cripples."

William Morgan, the defendant's general foreman, admitted that he could not say whether any of the boards were nailed to the "cripples."

Mr. Clavel Salter: After that admission I do not think that the matter can be carried any further.

The Judge: No; I find for the plaintiff for 30*l.*, and allow all costs.

---

### IMPORTANT ACTION AGAINST A GAS COMPANY AND CONTRACTORS.

THE case of Jordeson *v.* the Sutton, Southcoates, and Dypool Gas Company came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Rigby and Vaughan Williams, for judgment on the 16th inst. on the appeal of the defendant Company and Messrs. Holmes & King, contractors, from a decision of Mr. Justice North, in the Chancery Division, who had granted the plaintiff, a solicitor of Hull, an injunction in respect of alleged obstruction to ancient lights and had granted him damages for injury to property caused by the defendants' works. The case was reported in the *Builder* of February 19, August 13, and October 29, 1898.

The Master of the Rolls, in giving judgment, having stated the nature of the order appealed from, said the contentions raised by the defendants were numerous. They contended that, assuming the plaintiff's ancient lights to have been darkened and the plaintiff's buildings to have been damaged, still no action would lie having regard to their Parliamentary powers; secondly, that as regarded the ancient lights, assuming an action would lie, no injunction ought to be granted, and that damages only ought to be awarded; and, thirdly, that as regarded the damage to buildings caused by subsidence no action would lie because such subsidence was occasioned by pumping water out of the defendants' own land, thereby drawing water from beneath plaintiff's land, which defendants urged gave no right of action. The plaintiff was the owner of some land in Hull, and on the land were erected a number of small houses, some of which had existed for more than thirty years before the commencement of the present action. The defendants were a gas company, whose works were within a short distance of the plaintiff's property, and they had power to buy land by agreement, but not compulsorily. The Gas Company's Acts clearly authorised some nuisances, such as breaking up streets, &c., and such nuisances, expressly authorised by Parliament, gave rise to no cause of action unless there was negligence in the exercise of those statutory powers. In the district where the plaintiff's land was situated there was a stratum of what was called running silt, which was well known to persons acquainted with the geological nature of the soil on which the town of Hull stood, and which was a constant source of trouble to persons who had to make excavations. This stratum was some 6 ft. thick, and was at a depth of about 22 ft. below the surface at the point where the defendants' and plaintiff's land was situate. The land on which the plaintiff's houses stood was, in fact, supported by this stratum of silt and the earth above and below. Before 1887 the defendants' works were comparatively small. There was one gasometer of no great height, and the works were not such as in any way to injure the plaintiff. But in 1887 the defendants resolved to enlarge their works and to construct a large gasholder having a diameter of about 52 ft. and a length of about 105 ft. at the ground level. The defendants began to excavate their land for the purpose of this gasometer and in doing so they cut into this bed of silt. They took all reasonable precautions which experience suggested to keep the silt from escaping into the excavation and the sides of the trench from falling in. Notwithstanding all their care, the land under the plaintiff's houses subsided and this subsidence caused damage. So far, there was no dispute about the facts. There was, however, a considerable controversy as to the nature of this silt, whether it was muddy water, as distinguished from wet sand. That the structural damage of which the plaintiff complained was caused by the defendants in the execution of their works was not disputed, and it was also not really disputed that there would be some obstruction to the light coming to the plaintiff's houses if the gas-holder was raised to its full height of 105 ft., and the defendants contended that whatever their liability might have been apart from their special Acts of Parliament, they were protected by their statutory powers against such actions as the present one. In 1867 and 1873 the defendant company obtained special statutes which gave it certain defined powers, and also incorporated the Gas Works clauses Acts of 1847 and 1871, and they relied upon these Acts to justify what they had done. He did not think they had made out their contention on this point. As regarded the injunction granted by Mr. Justice North against raising the gasometer to its full height, he did not think such an injunction ought to be refused. The plaintiff's rights could not be adequately vindicated by damages. The liability of the defendants to pay damages for subsidence required careful consideration. That the excavation caused subsidence was clear beyond all controversy. *Prima facie* the defendants had no right to do what they had done, and it was for them to justify their conduct if they could. They had attempted to do so by reason of their special statutory powers, but even then they would, in his opinion, be liable at common law. The defendants relied upon the case of Popplewell *v.* Hodgkinson, which they said laid down that a man could do what he liked with his own land, even though he might thereby cause injury to his neighbours. The question thus raised was of extreme importance, and by no means free from difficulty. The conclusion he had come to was that the operations of the defendants, carefully and skilfully conducted as they were, resulted in the removal from the plaintiff's land of a considerable quantity of silt, with the result that the equilibrium of the soil beneath the plaintiff's houses was disturbed and that there was a movement of the sand towards the excavation. The plaintiff's houses were supported by a bed of wet sand and not by a stream of water, and this was the conclusion at which Mr. Justice North also arrived. What had been done was a nuisance in common law and the judgment of Mr. Justice North being correct in all points, the appeal would be dismissed with costs.

Lord Justice Rigby concurred, but Lord Justice Vaughan Williams dissented from the rest of the Court on the subsidence point. The appeal, therefore, by a majority of the Court, was dismissed with costs.

Mr. Haldane, Q.C., Mr. Macnaghten, Q.C., and Mr. Boome appeared for the appellants; Mr. Upjohn, Q.C., and Mr. Dighton Pollock for the respondents; and Mr. Bardswell for Messrs. Holmes & King, the contractors.

---

* The prices for wood are shipping prices. Ten per cent., approximately, should be added in order to arrive at the current trade prices.

◆

## RECENT PATENTS:

### ACCEPTED SPECIFICATIONS.

*Open to Opposition until July 10.*

[1898.] 10,005, Adams, Disconnecting Chamber for Drains. 10,177, Meiklejohn, Lamp Irons for the Suspension of Electrical Fittings. 10,289, Hall, Owen, & Dayton, Gas Burners. 10,768, Miller, Combined Monkey and Pipe Wrench. 11,098, Place & Jolly, Valves and Taps. 11,627, Smith, Electrical Cables. 12,159, Hirth, Adjustable Drawing Tables. 12,336, Lindemann, Glass Panels, &c., for Decorative and similar Purposes. 12,495, Somerville, Prepayment Mechanism for Gas and other Fluid Meters. 12,876, Gjers & Harrison, Nozzles for Spraying Water, &c. 13,168, Lines, Water-closet Flushing Cistern. 13,413, Saunders, Ventilators. 13,417, Darling & Sellers, Dividing Apparatus. 13,725, Toifel, Production of Designs upon Paper, Woven Fabrics, &c., by means of Template Printing. 14,080, Watts, Bearings for Bridges, Girders, and Principals. 14,422, Heywood, Door Stop. 14,431 Simpson, Wire Fencing. 14,612, Björnstad & Easton Anderson & Goolden, Driving Gear for Lifts and Hoists. 14,626, Norman, Apparatus for Breaking, Crushing, or Pounding Stone, Flint, and other Friable Material. 14,810, Davy, Electrical Couplings. 14,817, Hüllinghorst, Preparing and Connecting Metal Caps, Edgings, &c., for and upon Roofs. 14,918, Owles, Concrete Mixer. 14,966, Wood, Rotary Pumps. 15,272, Miller & Miller, and [1899] 3,439, Davies & Still, Lanterns, Hand Lamps, &c. 15,911, Swarbrick, Window-blind Roller. 16,519, Augé & Blûm, Automatical Breaker for Coke, Coal, and Anthracite. 16,999, Andreas, Electrical Accumulators. 19,785, Kellner, Incandescent Bodies for Incandescent Electrical Lamps. 22,190, Wilkinson, Joint Boxes and Switches for Concentrical Systems of Electrical Conductors. 25,656, Maxim, Calcium Carbide. 26,539, De la Roche, Drying Oils. [1899] 387, Unterberg, Iron Wall-carriers for Electrical Insulators, &c. 573, Cobb, Doors for Hospitals and other Buildings. 3,850, Price & Turner, Gas Stoves. 4,400, Prentice, Working, Cleaning, Dressing, Polishing, and Preserving the Surface of Stone. 4,431, Ferrell, Impregnating Cellular Substances, such as Wood, with Fire-proofing, Preservative, and other Re-agents in Solution. 4,639, Zamboni, Rivetting Tools. 5,029, Grouvelle & Arquembourg, Jointing Tubes of Ductile Metal. 5,140, Bigwood & Hancher, Stop Tap Boxes and Manhole and Interceptor Covers and Frames. 5,174, McLachlan, Stone Sawing and Moulding Machines. 5,748, Loufer, Glueing Machines. 6,153, Burrell, Fluid Motors, especially Suitable as Water Meters. 6,157, Johnson & Wunderlich, and 6,478, Hall, Electrical Arc Lamps. 6,568, Andrew, Window Sash and Blind Balance. 6,645, Fiedeler, Joints and Connexions for Extensible Structures. 6,684, Bacon, Carbons for Electrical Arc Lamps. 6,934, Haendeler, Stench Trap for Discharge Basins, Sinks, &c. 6,948, Cranston, Burners for Incandescence Oil Lamps. 7,010, Schubert, Connecting the Carbide Reservoirs of Acetylene Gas Generators. 7,082, Prévost, Lifting Jacks. 7,116, Bray, Apparatus for Bending or Welding Pipe. 7,169, Coe, Apparatus for Applying Metallic Leaf from a Package Roll to any Surfaces. 7,277, Aron & Aron Electricity Meter, Ltd., Measuring and Recording Electrical Currents.

### ABSTRACTS OF PATENTED INVENTIONS.

1,087.—KILNS FOR BRICKS, CEMENT, POTTERY, &c. *H. Beyer & F. Becke.*—The novelty lies in the mode of putting the articles that are to be baked in a set of superimposed layers arranged spiral-wise around the central columns of each chamber within the kiln, and in such a manner as to cause the gaseous products of combustion to circulate in spirals through the mass of each kiln before it is discharged into the next one, or escapes, as the case may be. Side flues, together with the central columns of air, help to keep up the spiral course of the gases, and dampers control the passage of the gases through the connecting flues.

1,138.—FITTINGS FOR SHELVES, &c.: *E. H. Ledger.*—At the junction of the shelves and the uprights is screwed a plate which has two, or three, or four channels or ways, and may be bent or cast from a blank.

1,143.—TILES FOR STOVES AND FIRE-PLACES: *F. N. Butler.*—To facilitate the fixing and unfixing of tiles without disturbance of the stove-front or the use of nuts and screws, parts of the jamb-mouldings are made removable by means of dove-tailed joints, so inclined that the removable part shall not fall out of its position: the tiles are slipped into their places behind the flsnges that hold them, when the removable part is replaced.

1,152.—BRICKS AND TILES: *C. H. Collins.*—The invention consists in fashioning each tile or brick with a projecting rib at its lower edge in order to protect the mortar joints from the effects of the weather; the ribs may be plain or ornamented, and the tiles will serve for walls arches, chimneys, ranges, fireplaces, lavatories, &c.

1,161.—DRILLS FOR BLASTING STONE: *W. Westwood.*—For blasting stone in quarrying, grooves are driven in the sides of an ordinary round hole, in the direction in which fracture is desired when blasting, by means of a tool that has cutting-wings. A plug is inserted into the hole before it is charged with the explosive.

1,170.—PREVENTION OF FREEZING IN CISTERNS AND WATER-PIPES: *J. Archibald.*—The cisterns and supply pipes are covered with layers of non-conducting materials, say, wood, cork, flock, or slabs of ground cork and sawdust. A forked rod clamped to a cross-bar, made in two parts connected by clamping-screws, that extends across the cistern prevents the ball-cock from closing in frosty weather, by which means, it is claimed, a steady flow of water will be ensured.

1,195.—A SLIDE CALLIPER GAUGE: *H. Kienast.*—For the initial adjustment the slide is moved along a graduated bar together with a part to which a spring connects the slide. When the slide is clamped, by means of a screw, a graduated wedge is forced down for the taking of the fine adjustment, and the reading is taken opposite a line upon a plate which is screwed to the slide, or a vernier may be marked upon that plate, which is adjusted for wear by slots and screws.

1,212.—AN AUTOMATICALLY DISCHARGING SIPHON: *A. Wollheim.*—For sewer flushing purposes a bell to form a siphon, and trapped, covers the upper end of the discharge-pipe of the reservoir above, the upward branch of the siphon is made to project into the drain in order to facilitate the seal's displacement when there is a sufficient head of water in the reservoir, the top of the trap between the siphon branches is roughened or flattened in order that the air-seal may be retained as long as possible, and that the siphon's efficiency may be increased owing to the consequent escape of the air in a greater volume.

1,236.—FITTINGS FOR BATHS, LAVATORIES, SINKS, AND BASINS: *F. C. Lynde.*—Two levers are pivotted within a bracket bolted to the edge of the bath, one lever is connected to the top of the valve stem, when the other lever is turned to the left-hand a projection thereon engages with a similar projection on the stem which it thereby raises, the stem falling back by its own weight when the lever is turned back again, the valve-stem's bottom end has three side projections that register with internal or external recesses upon the top of the overflow pipe in which a screw fastens the stem.

1,284.—SIPHON DISCHARGE: *T. Gange.*—In order to prevent noise a spreader is provided for the incoming water, and the standpipe is fashioned with a trumpet mouth and flange. An annular flange at the bottom partially closes the bell, the standpipe being inserted before the bell's top is soldered down.

1,314.—CASTING BLOCKS FOR BUILDING PURPOSES: *F. Cohn & G. H. G. Brunckhorst.*—The mould has a base and four hinged sides, which, when closed together, are locked with latches, and two of them carry strips, forming grooves, for the union of the blocks by cement, &c., whilst a sectional core, to be expanded by a central wedge, is passed through openings in the two grooved sides. Channels for pouring in cement to reach the grooves are formed by means of core-rods, which pass through holes made in the two sides, or the holes may be utilised for iron rods to strengthen a conduit or chimney top which is made out of the blocks. In casting the cement is poured into the mould, the top surface is made smooth, and when the mass has become set the cores are taken out and the sides of the mould are unlatched.

1,319.—ARTIFICIAL STONE: *P. Kleber.*—The inventor makes a stone for fire-bricks, and building and paving blocks, &c., by wetting a mixture of ground calcined lime, sand, and quartz with diluted hydrochloric acid, and subjecting the moulded blocks to the pressure of super-heated steam in a closed vessel or drum; as a variant of the process he substitutes hydrochloric acid vapour, passed into the drum together with the steam, for the hydrochloric acid mixed with the compound.

1,356.—SASH FASTENINGS: *P. Meredith.*—To a lug upon a bracket fixed to the outer sash bar is pivotted a forked lever, which engages a tongue upon the inner sash-bar, and is drawn tightly by means of a thumb-screw; the lever is held in either an open or a closed position by a spring, and the inclined shoulders of the tongue serve to force the sashes upwards and downwards.

1,378.—CEMENTS FOR PAINTS AND SIMILAR PURPOSES: *Lithosite Manufacturing Company.*—The invention relates to cements that are applicable to paints or to any uses of Portland cement. Magnesium oxide is mixed with the solution of magnesium chloride obtained by evaporating sea-water, the evaporation being then continued at a higher temperature. With the material thus produced calcined magnesite is mixed, and the compound is ground to form cement; by an alternative process boracic acid is added to the mother liquor, and, after evaporation, the product is ground with calcined magnesite, or ground burned clay is added to the magnesium chloride; for use as mortar the cement is prepared by grinding sulphate of magnesium and sulphate of aluminium with the calcined magnesite; for use as paint the cement is finely ground and mixed with water.

1,474.—ANTI-CORROSION VALVES: *W. S. Newton.*—For resistance against corrosion the seat or face of the valve is enamelled, the opposing part being made, in each case, of soft material. The enamel can be fused into a groove in the valve seat, or a moulded ring of enamel may be cemented in the groove; by another method the enamelled seating is made detachable from the body of the valve or tap.

1,477.—ACETYLENE LAMPS: *J. G. A. Kitchen.*—For lamps that have feeding-wicks the supply of water to the calcium carbide is regulated by the following contrivance—one end of the wick passes through a hole in the upper plate of the carbide container, is coiled in a cylinder outside the plate, and is secured to a piston upon the end of a screw outside, when the cock is opened the quantity of water that is fed from the cylinder is determined by varying the amount of pressure upon the coiled wick by means of the screw; the carbide container is made in two parts, the lower and detachable part is secured by clips, and the water in the vessel above, or at the side, keeps the container cool.

1,536.—TRIPOD STANDS FOR SURVEYING INSTRUMENTS, &c.: *J. W. Bennetto.*—The invention is devised to provide means for limiting the stretch of the legs of tripod stands by jointing three stay rods to the legs of the stand and also to a sliding socket that can be clamped anywhere along a central rod which is fixed beneath the table of the stand.

## TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at public meetings, rests, of course, with the authors.

*We cannot undertake to return rejected communications.*

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

We are compelled to decline pointing out books and giving addresses.

Any commission to a contributor to write an article is given subject to the approval of the article, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR: those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and *not* to the Editor.

## TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us *not later than* 10 *a.m. on Thursdays.* N.B.—We cannot publish Tenders unless authenticated by the name and address of the sender; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is given, nor any list in which the lowest Tender is under £100, unless in some exceptional cases and for special reasons.]

* Denotes *accepted.* † Denotes *provisionally accepted.*

## *American Competition.*

IN (another column we publish some quotations from an interesting letter on the subject of American competition, and the reasons why America is outstripping us in practical and technical work. Public attention is being rapidly directed to a matter which those who have watched the commercial progress of the world have for some time been well aware is increasing in importance. The more the subject is discussed, the more will the public mind become impressed with its importance to our national prosperity. As we have said over and over again in considering the subject of technical education, no real progress can ever be made with it until public interest is so aroused as to create a public opinion. When we get that we shall have obtained the motive power to set the legislative machine in motion.

It is natural, however, that when the country begins to realise the serious character of American competition it should look round in a dazed and puzzled manner. When it hears of large contracts for bridges or railway rolling stock being sent to the United States, there is at once something which appeals to the public imagination. Little bits of household ware, corkscrews and such like, are appreciated as desirable innovations. When the amount paid to American manufacturers is calculated in thousands of pounds the Englishman begins to perceive that things are getting serious.

The correspondent whose letter we quote elsewhere fastens on the discouragement of invention in this country as one reason why the manufacturers of the United States are gaining upon us. But we must go to broader, more fundamental reasons. The United States manufacturers are now getting enormous supplies of the raw material. It is impossible here to go into statistics, but it is the production of raw material, and the creation of the means of transit, which are largely responsible for the present competition. The truth is that, to a great extent, England for many years had, owing very much to her coal mines, a monopoly of many manufactures. She is now beginning to find that if a competitor enters the field profits are at once cut down. We may cry out as much as we like; nothing, however, can minimise this cardinal fact.

As soon, however, as we have competitors it is found that a condition of affairs which did well enough in what we may call pre-historic days is unsuitable now. For example, the competitors have plant and machinery of the newest kind; their rates and taxes are, probably, lower than those to be found in an old country such as England. These things cannot be altered in a day. It is all very well to say to a manufacturer, "Your plant is old-fashioned," but new plant requires a large capital outlay, and it may be better commercial policy to be content with smaller profits arising from existing plant, than to risk investing new capital. There is also another point to be noted which is often overlooked. The proprietors of many of the most important undertakings are the sons or grandsons of those who first made them famous, or shareholders in limited companies. In the United States the leading manufacturers are usually men who have to make their fortunes. The difference is important. For the incentives to competition go a long way towards making such competition efficient.

Again, complaint is made of the cost of transit in England. But it has to be borne in mind that English railways as commercial undertakings are by no means remunerative. The rate of return which they pay would be regarded as small by a business man in connexion with his own business. The South Wales coal strike almost deprived the shareholders of the Great Western Railway of their dividends, thus showing what a narrow margin there is between the present rate of return on the capital and none at all. To ruin one industry to assist another is not sense, and railway directors who protect the interests of the shareholders who have elected them to office are acting as the agents of a large body of the most thrifty of the population. It is a mistake also to overlook the fact that the North of England manufacturers have seaports at their doors, and thus have full equality of opportunity, so far as regards foreign countries, with the manufacturers of the United States.

For this reason we do not think that the competition of the American manufacturer need be so greatly dreaded—we have still a large part of the world for our market. But we have in that market to face competition. We shall probably have to be content with smaller profits; and smaller profits, in an old country, and on smaller capitals than are becoming common in America, means much less return. In other words, it means for manufacturers a living as distinguished from a fortune. But it does not mean that the workman suffers or that the general consumer has anything to complain of. The former still earns good wages, the latter has a larger choice, and is supplied at a lower cost with what he needs.

What is now necessary in this country is an awakening to changing conditions. If this causes a greater keenness in inventions, better terms for inventors, better elementary and technical education, and a general bracing up of the mind of the capitalist and the artisan to the commercial struggle, it can do nothing but good. The English manufacturer, just like the English farmer, has not hitherto appreciated the changing circumstances of the century. But it is not state aid which will keep English manufactures in the front; they must depend on individual effort.

◆

## ARCHITECTURE AT THE ROYAL ACADEMY.—II.

WE may continue our remarks on the architectural designs at the Royal Academy by noticing, in the first place, some of the examples of church architecture which we have not already commented on. Church designs are not very numerous; nor is there very much of novelty or originality to be found among them. Character, however, there is in Messrs. Brewill & Baily's "Presbyterian Church, Nottingham" (1,654), chiefly shown in the design of the tower, with its long nearly unbroken buttresses built with a continuous batter. This use of battering lines, even in the main wall surface of buildings, is becoming rather a favourite one now; we see it again here in the small drawing of a tower by Mr. Grocock (1,685). Applied to the main wall surface it is a doubtful expedient, generally implying a waste of material; in buttresses it is legitimate enough. The curved or ogee lines of the copings of the battlements in Messrs. Brewill & Baily's design are a feature in line which was only introduced a few years ago, but is rapidly becoming a commonplace. The authors of this design (or their draughtsman) have something—one might say everything—to learn about the construction and meaning of a sundial, as they innocently show sundials on both the south and west faces of the tower, the gnomons of the dials at right angles with each other! Apparently therefore they are not aware that the gnomon of a sundial, wherever placed, whether on a pillar or on the surface of a vertical wall, is a line parallel with the earth's axis; they will find the matter intelligibly explained, with a diagram, in an article in the *Builder* for December 21, 1889. No plan of the church, by the way, is given. Mr. E. P. Warren does not fall into this latter condemnation, affixing a small plan to his pretty pencil sketch of the church of "St. Martin, Bryanston" (1,658), chiefly noticeable for the treatment of its massive tower with heavy buttresses, with which the rest of the building is well in keeping. Mr. Caröe's large and finely tinted drawing of the "Tower of St. Mary, Yate, Gloucester, as now completed" (1,675) does not show how much of the tower is old, as we suspect a portion of it is; this may account for the want of definite point and contrast in the design; if the blank traceried windows in the middle stage are ancient, there was nothing for it but to repeat somewhat the same design in the windows of the upper stage; otherwise, the middle stage would have been better left as blank wall.

Messrs. Mallows & Grocock's "St. Matthew's Church, Willesden" (1,709), a "passage-aisle" church in which a plan is shown on the same scale as the elevations (an unusual indulgence in the Architectural Room of the Academy), appears to have some special point in the arrangement of the plan, which, however, is hung too high to be well seen. Mr. R. W. Paul's three drawings, of the new chancel and transepts at Chard Church, Somerset (1,787), the lych-gate at Wootton Fitzpaine (1,708), and the new screen at Abbey Dore parish church (1,720), are illustrated in the present issue, and therefore require no description here; they all show knowledge of mediæval style combined with good drawing. Messrs. Walter A. Hills & Sons' "Proposed Church, Bromley-by-Bow" (1,715: no plan), shows in neat pencil elevations a simple design apparently with a single-span roof, a clearstory being formed by dormers in the roof slope. A more important work is Mr. Caröe's "St. Matthew's Willesden" (1,716), a tinted pencil perspective of the east end; it has the appearance of being a brick church, from the treatment of the drawing, with an east window divided by large mullions, almost of the scale of piers, into three sections, a treatment rather frequent now, and which gives a very solid appearance to a window design, though it may be questioned whether the effect of these decisive vertical lines butting against the arch line is always satisfactory. The east wall is flanked by two perfectly plain octagonal angle buttresses; the design of the transept end is in the same severe style; a small turret with a low-pitched hipped roof rises above the rest of the building, and is treated with a good deal of character; altogether this is a drawing to repay attention. A small plan is added. Messrs. Stokes & Hine's "All Saints' Convent, Colney Chapel, St. Albans" (1,723), may count with the church designs, though the chapel is not actually shown in the drawing; it is a view in the cloister court, noticeable for the treatment of the cloister windows, which are segments of circles springing directly from the sill line, with no vertical jamb, and filled with tracery; the effect is good and a little unusual; the gate-tower at the side is commendably massive in character, but has a somewhat unfinished appearance at the top. The projecting bays or oriels above the cloister arcade look rather intruders, and do not improve the general effect. Mr. J. W. Simpson's "Union Church, Brighton" (1,753), is the largest church design in the room, if, indeed, we are to call that a church which has more the character of an "Institution" or some other entirely secular building, but it probably belongs to a denomination with whom this is of no consequence. The plan consists of a square centre space out of three sides of which open large semi-circular bays, the fourth side being flat; not a very good outline of plan for an interior. The façade towards the principal street is treated partly as a kind of screen decorated with an order of attached columns, the staircase blocks at each end being emphasised by rather heavy lantern erections over them; there is a large dome over the centre, but its lines are not marked on the plan, and its relation to the substructure is not very apparent; its construction in fact must be rather a sham. The general effect is ambitious but the details are coarse and commonplace.

Three interiors should be mentioned; that by Mr. Fellowes Prynne of "Holy Trinity Church, Roehampton" (1,726), chiefly noticeable for its built stone traceried screen filling the chancel arch, a revival of a mediæval treatment which Mr. Prynne has made almost a feature of his own; Mr. Goldie's "Church of Our Lady of Lourdes, Acton" (1,832), a quasi-Romanesque interior of fine style, treated with a certain amount of colour in the ceiling and dome, with decorations on a blue ground; and Mr. Seth-Smith's "St. Luke's, Maidstone" (1,777), an interior showing a good deal of originality in the design of the piers and arcade.

Designs for church furniture, &c. (not very numerous), may fitly be grouped with church designs. The most important of these, the "Sketch working model for bronze screen at Whippingham" (1,925), by Mr. Alfred Gilbert, is among the sculpture in the lecture room, but was intended, we understand, for the Architectural Room. The model shows an arcade of Transitional character, the bays filled in with gilt metal-work of a very free style of design, and rather too sketchy to enable one quite to appreciate the detail. As far as it can be judged of, however, we are inclined to think that this very free style of design in metal-work, which Mr. Gilbert has had a good deal of influence in introducing, however well it may go with sculpture, tends rather to lose the quality of decision and purity of line which should characterise architectural metal work, and has rather too much the appearance of metal tied up into knots. To return to the Architectural Room, Mr. Horsley exhibits there a pen drawing of his "New Screen, Ipstones, Staffordshire" (1,623). This is generally Gothic in style, but with some rather new and free treatment of detail; the posts which form the chief upright members are square in section and unmoulded, and covered, as well as various panel portions of the design, with small conventional floral ornament. The impression produced by the drawing is that this ornament is intended to be painted, and that the whole would have been shown better in a coloured drawing; as it is, one has rather to guess at the effect in execution. Mr. Caröe exhibits a drawing of the wooden carved reredos for St. David's, Exeter (1,674); the wide panel margin springs from brackets at each side, and is carved with figures in the vertical portions, the horizontal panels being left plain. Mr. R. A. Briggs exhibits a design for an altar and folding reredos for Jesus Chapel (1,800; we are not told where the chapel is—is it that of Jesus College, Cambridge?); the general effect, all gilt, is very rich, but the drawing is sketchy and does not give the detail clearly. Mr. Ralph Knott exhibits a small sketch of a font (1,711) of very pleasing and original design, with tapering colonnettes at the sides, and a dome-shaped metal cover crowned by a little bronze winged figure. Mr. H. Wilson's "Design for a Chalice" (1,694) for St. Bartholomew's, Brighton, is hung rather high; the knops appear to be formed of a twisted serpent; the treatment of the base is rather wanting in decision of line. The drawing shows all the author's usual mastery of effect in water-colour drawing. The same exhibitor's "Design for a Calvary" (1,627) for the same church, a dark crayon drawing hung too high to be well seen, seems rather to come under the head of sculpture design than architecture. A small sketch exhibited by Messrs. Rogers, Bone, & Coles, for a pulpit and bench-end for St. Brelade's Church, Jersey, exhibits a good deal of character in work of a simple and inexpensive order.

Among the drawings representing civil architecture is Mr. H. B. Garling's "Study for the principal façades of the New War Office, in the original competition of 1857" (1,864). This at the present moment is of some interest, taking us back to the former epoch in the undertaking, and illustrating the design and drawing of nearly half a century back. The drawing is a large perspective view of the proposed building, which is grandiose in general character, with large square centre pavilions rising above the corniee line on each face, and smaller ones at the angles. What it wants is more concentration in the design; it is in fact Classic treated in a rather Gothic spirit, aiming at multiplicity rather than breadth of effect; the windows all separate and each with its own framework of pilasters, except in the two rusticated lower stories, forming a basement which does quite sufficiently detach itself from the rest of the design. The weak point in the design is the semicircular *frontons*, as the French call them, in the centre of the raised pavilions, with nothing behind them; a feature which would hardly be introduced in the present state of architectural taste. But the author did quite right to exhibit the design again, and has added a point of interest to the exhibition in doing so.

Among other works of secular architecture (excluding domestic, which we will deal with separately) Messrs. Bateman & Bateman's

"Cannon-street Hotel, Birmingham" (1,632), has more character than one generally sees in hotel architecture, and is entirely free from the "showy" element so disagreeably prominent in the average hotel building. It has a stone basement with plain mullioned windows, supporting a brick structure over it, with a boldly treated gable and semi-octagon turrets on carved stone corbels. The authors are to be commended for showing also complete plans of the building. Messrs. Lanchester, Stewart, & Rickards exhibit their very effective drawing of the selected design for Godalming Town Hall (1,636), published in the *Builder* of November 12, 1898; but they do not give the plans. In their competition design for memorial buildings, Singapore (1,647), Messrs. Ashley & Armstrong have cleverly contrived to impart a certain degree of oriental character and outline to a building mainly treated with classic details. Mr. W. S. Bates's clever design for a concert-hall (1,661), sent in competition for the Soane medallion, we have already published and commented on; we are glad to see it exhibited here. Mr. R. J. Lovell's "Newport and Monmouthshire Hospital" (1,683), a large perspective drawing of little architectural interest, is of no value without plans of the building, without which no hospital design ought to be exhibited at all; the picturesque, even if it were present (which it is not in this case), is not the object of hospital designing.

Messrs. Hall, Cooper, & Davis exhibit a small water-colour drawing, hung too high to be well seen, of the "North-east Angle of New College, Scarborough" (1,695), which looks a very effective bit of design, consisting of a brick tower-like erection, projected diagonally at the angles, and partially enclosing a polygonal two-storied bay in stone; the general effect is very picturesque. It certainly contrasts favourably, as a bit of collegiate architecture, with Mr. Champneys' bald and coarsely drawn elevation of "New Buildings, New College, Oxford," without a detail that could not be got out of books of late Gothic work, and which is hung on the line, one cannot tell why. "A Part of Trowbridge Technical School" (1,703), by Mr. Thos. Davison, deserves mention as a good coloured detail elevation of part of a stone front. In his "New Town Hall, Henley-on-Thames" (1,765), Mr. Hare has given municipal character to a town hall for a small town, without departing from the simplicity of treatment suitable in such a case; the building has what may be called a municipal front—a pediment on coupled pilasters and with boldly-carved Royal arms under; the projections at the side are pedimented also, to give a finish to the "municipal" front; behind it the building is very simply treated with rows of windows and no architectural pretension. This is one of the most satisfactory designs of its kind in the room; it is a pity that no plan has been added; Mr. Hare's plans are always so good that he ought to set an example of not exhibiting without them.

Messrs. W. A. Pite & Balfour's "Competition Design for Cardiff Law Courts" (1,789), an elevation, looks very good in general outline, but is hung too high to be seen. A competition design by Mr. R. O'B. North, for the Liverpool Royal Institution, is a curious and unsatisfactory combination of an Ionic order with very small cottage-like mullioned windows and a red-tiled roof; why it is hung in so good a position is another of the puzzles which meet us every year in the Architectural Room. Mr. G. D. Martin's "Flats at Kensington-square" (1,819) represents the commonplace disguised under effective drawing. Mr. Townsend's "Whitechapel Picture Gallery" (1,820), on the contrary, represents the too palpable effort to escape from the commonplace, resulting in eccentricity both in the moral and material sense. Why is the large arched doorway so uncomfortably out of the centre of the front, and what is the meaning of the kind of bracket forms by which the arch mouldings are interrupted? Eccentricities of this kind may interest for the moment, but people will soon tire of them. Mr. A. H. Hart's "Proposed Club House, Woodbury, Devon" (1,856) is a picturesque design with "country town" feeling about it; a little more simplicity in the details, without altering the general grouping, would have improved it. Mr. E. T. Hall exhibits two important drawings, but both without plans. The "Additions to the British Home for Incurables" (1,866) is a picturesque block chiefly in red brick, well contrasted with the stone erection containing the entrance porch; and the block which is evidently the dining-hall is so characteristically designed that there can be no mistake about it, even without the plan. The "Head Offices, Metropolitan Asylums Board" (1,868), is a building on an irregular site, looking rather like a large hotel, and to which a certain special character is given by the semi-circular projections which terminate in small domes; but this is just a case where a plan is required to give the explanation and justification of such features.

Among minor works in civil architecture the following may be mentioned: "Manufactory, Charing Cross-road" (1,748), by Messrs. Roumieu & Aitchison; a good deal more character might be got out of this class of building than is afforded by this regular repetition of cornices and rows of windows all alike; and what is the advantage of the immense vases on the top, as high as the windows—wholly unsuitable to the character of the building and destroying its scale? "Design for a Convalescent Home" (1,834) by Mr. F. D. Clapham; block plan only given, the perspective makes a pleasing group. "Design for Almshouses and Gardens" (Mr. W. E. Dobson (1,846), a pretty sketch, but a kind of thing very easily turned out where there is sufficient dexterity with pencil and brush. "Competition Design for Free Library, Putney" (1,816), by Mr. Sydney Perks; a small, rather bold elevation in Classic style, suitable for its purpose and situation. "Portion of Proposed Street of Flats in Dulwich" (1,784), by Mr. J. W. Rhodes, is a very meritorious design for the characteristic treatment of flats for lower-class tenements; they are mostly roughcast walls, with gabled brick portions at intervals; the gables are treated with a good deal of special character in a simple way. The turning round of the door arches into a three-quarter circle, stopped at the return by a stone upright, looks perhaps a little like a kind of joke; but in the main this is a very good attempt to give character and interest to lower-class street houses.

◆

THE NINETY-ONE ART CLUB.—This club will hold their annual exhibition of members' work at the Maddox-street Gallery, Maddox-street, during the first four days of June.

## NOTES.

**Decoration of St. Paul's.** IT is announced that at a meeting of the Decoration Committee of St. Paul's on the 15th inst. it was decided that the stencilling should be removed—which we are glad to hear of; and also that the south-west semi-dome should be completed without any decoration of the flat stonework, to consider what would be the best manner of finishing the arches. Thus the two points to which we mainly objected, before any of the hysterical writing in the daily papers commenced, are now secured, and it is to be hoped that there will in future be more caution and consideration exercised as to what is to be done. We are still of opinion that the nave and transepts should be left as Wren left them; but the dome must undoubtedly be decorated, as the choir has been, and as forming a portion of the ritual area of the services. But its treatment requires the greatest care and consideration. We cannot refer to the subject without a word as to the ridiculous exaggerations which have been made by people who talk of the "desecration" of the cathedral by Sir W. Richmond; a kind of expression which stultifies those who use it. The art students who memorialised the Committee got a deserved snub from Mr. Andrew Lang, to whom among others they submitted their memorial, who reminded them that "Sir W. Richmond is your fellow-being, and has probably been an art student." The whole case was very fairly put by the writer of an excellent letter signed "Candour," which appeared in Monday's *Times*, and formed a welcome contrast to much of the exaggerated and spiteful nonsense that has been written on the subject. Sir W. Richmond's exceedingly self-satisfied and "superior" attitude in the matter is of course in bad taste, and has done him no good with the public or the architects; but it does not follow that an artist is incompetent because he has a very good opinion of himself—a weakness which, in fact, is not uncommon with artists.

**The City and the London Gas Inquiry.** MR. A. C. MORTON, of the Corporation of the City of London, succeeded Mr. H. E. Jones as witness before the Select Committee of the House of Commons. The Corporation, like the London County Council, is dissatisfied with the price charged for gas by the Gas Light and Coke Company; but we do not think that the citizens of London would view with much favour Mr. Morton's proposal that the South Metropolitan Gas Company should be allowed to compete in the City with the Gas Light and Coke Company. One gas company's staff constantly at work breaking up and laying down City streets is nuisance enough; the presence of a second company would be almost intolerable. Referring to the fact that the City streets are mainly lighted by electric light, Mr. Morton said that, by reason of its great expense, the electric light was worse than the gas. Mr. Doughty, who appeared on behalf of the Vestry of St. Leonard's, Shoreditch, would also give the South Metropolitan Company power to supply gas on the north side of the Thames. We believe that this company would be able to supply gas north of the Thames at a lower price than that at which it is now supplied by the Gas Light and Coke Company; but, in view of the powers already granted by Parliament to the Gas Light and Coke Company, and the hopeless entanglement of mains and services that would necessarily ensue, the suggestion cannot be regarded as a very practical one. We understand that the Committee has adjourned until June 2.

**Electrical Engineers and Telegraphists.**

THERE has been considerable discontent lately amongst cable and telegraph engineers owing to the way their branch of the science has been treated by the Institution of Electrical Engineers. With the exception of the papers on wireless telegraphy, which is, of course, a very small branch of the subject, the only paper this year connected with telegraphy was Mr. Elton Young's on the measurement of capacity. Owing to his unavoidable absence the paper was taken as read, and the subsequent discussion was confined within very narrow limits by the chairman. Mr. Alexander Siemens, a former president, managed to make a few remarks praising up the speed of the signalling on one of the cables of the Commercial Company as compared with the cables of the Anglo-American Company. His remarks, based as they were on insufficient data, obviously required answering, considering the magnitude of the financial interests involved, and several of the subsequent speakers desired to do so. They were, however, ruled out of order by the chairman. Although he was technically within his rights, and although most of the members present were anxious that the discussion should be curtailed in order that they might hear the paper on electric traction read, yet as the rules regulating debates had been broken over and over again this year without let or hindrance, the cable experts present, some of whom had come great distances, were naturally indignant. The younger electricians, in their enthusiasm for the more modern developments of electricity, are apt to forget the enormous importance of submarine telegraphy, and the immense capital expended on it—a capital even yet greater than that expended on any other branch of the science. As the Institution was originally established by the telegraph engineers, it seems somewhat unfair that so little attention is paid to their science, and almost undutiful to closure their debates.

**British Association of Draughtsmen.**

WE have received the prospectus of a new society under this title, which at first looked like a kind of re-birth of the Architectural Association, since the latter institution had its origin in the wish of architectural draughtsmen to meet and know each other. The British Association of Draughtsmen, however, seems to attach a wider meaning to the word draughtsman, as it provides that "members shall be draughtsmen who shall have served at least seven years in office and works or yard of Architects; Civil, Consulting, or Mechanical Engineers; or Shipbuilders." Associates are to be "apprentices and improvers who are attached to and serving their time in any of the above departments from sixteen years of age, until qualified for the election of membership" ("to membership," it should surely be, grammatically). Moreover, the Association is not for London only, but is national. Apparently it is intended as a representative institution of all those who are employed in drawing out constructional work of any kind. Such an association can hardly be formed and properly worked without being of advantage to the large class of skilled workers whom it represents, and we hope it may be successful.

**Working Class Dwellings in Coventry.**

THE City Engineer and the Medical Officer of Health of Coventry have been commissioned to draw up a Report to the Artisans' Dwellings Committee of the Corporation on the provision of dwellings for the working class. It seems to be admitted that there is a great deal to be done. The Report includes a good deal of information as to experience in other towns, but it does not appear from it that the Coventry authorities are prepared to carry out any very strong measures of reform. In one paragraph it is remarked:—

> "They have continually to bear in mind their restricted powers, and to aim at achieving simply that which is the best possible under the circumstances. It would be puerile for them to lay down the dictum that back-to-back houses are undesirable, and should be demolished. We ourselves are fully convinced that their existence is undesirable, but the fact remains, that their cheaper construction allows their rents to be lower than through-ventilated houses, and some large towns at the present moment are allowing their construction. It is impossible, therefore, to condemn such houses, on that ground alone, as insanitary, for no magistrates with the facts fully placed before them would confirm the condemnation."

Surely in that case the Coventry magistrates want educating.

**Report on the Health of Liverpool.**

THE annual Report of the Medical Officer of Health of Liverpool, a volume of over 200 pages containing a great amount of statistical information, shows among other things that the Liverpool authorities have a great deal to do yet in the way of improving the humbler class of town dwellings and removing insanitary property, though they are evidently not idle in this matter. The last "presentment" in regard to insanitary property referred to a total of 365 houses (not all grouped together), of which fifty-four were uninhabited, owing, in many cases, to extreme dilapidation. The character of the property is thus described:—

> "The general arrangement of the dwellings correspond to the well-known and often-described court property in Liverpool, the houses being back-to-back and side-to-side with others, having no adequate or through ventilation,' and without a sufficient closet accommodation to fulfil the requirements of health and decency. In many instances little, if any, sunlight could get to the courts, and the atmosphere within the dwellings was always foul, owing largely to the saturated condition of the walls and ceilings, which for so many years had absorbed the exhalations of the occupants into their porous material. Singular testimony to the absence of sunlight in these courts was furnished by the action of the Parks and Gardens Committee, who desired to brighten the homes of the poorest class by gifts of growing flowers and window boxes; but these gifts could not be made in courts such as these, as flowers and plants were susceptible to the unwholesome surroundings, and would not live."

When we come to the case of human beings having to live in courts where no plant will live, we seem to have reached the extreme of insanitary condition. In one case the authorities compelled the demolition of a row of ten new houses built in defiance of the Building Regulations of the City, but it is added that "there are many disadvantages of cheap houses which are quite beyond the control of any public authority." Some photographs attached to the Report show one or two of the slums which are, or are to be, demolished, and one or two views of wholesome and substantial dwellings recently erected by the Corporation.

**Wolvesey Castle, Winchester.**

WE gather that in reply to a petition recently addressed to them by the House of Laymen for the diocese of Winchester, the Ecclesiastical Commissioners state they have no intention of alienating any part of the palace grounds in respect of the proposed national memorial to King Alfred. The remains of the castle—whose grounds for the greater part are now occupied by the Diocesan Church House trustees—stand on the east side of the Close, being separated from the precincts by the Lock Pond main stream. On that site Henry of Blois, who also founded (1132) the Hospital of St. Cross, built himself a palace in 1138, using the materials of that erected by William I. on the north-west side of the present cathedral grave-yard, but pulled down by Bishop Henry as an encroachment upon church lands. The bishop's palace was rebuilt by Morley in 1684, under Wren's superintendence, and improved by Trelawney (died 1721).[*] During the contest between King Stephen and Matilda some fire-balls thrown from the castle consumed the later Hyde Abbey, near the city's north wall, whither the remains of King Alfred, his consort, and his sons Edward the Elder and Ethelred had been removed from the New Minster, and on the site of which, near St. Bartholomew's Church, a bridewell was afterwards built. There are views of the palace and castle in Wavell's book, on the margin of Godson's old map, and in Buck's view of Winchester. The palace remained entire, Camden says, until the Civil War, when it was plundered by Waller, and dismantled by Oliver Cromwell. The stones of the castle came from the Binstead limestone quarries which supplied much of the stone for the earlier portions of the cathedral.

**Lichfield Grammar School Competition.**

THE Lichfield Grammar School competition is another example of the preposterous nature of the claims made upon architects in small competitions got up in small places. The following two quotations from the instructions to architects show what ideas the Lichfield Grammar School Committee have in regard to the treatment of competitors:—

> "The premium of 20*l.* will be awarded by the Governors to the design which shall, in their opinion, be the best adapted to meet their requirements. The Governors will adjudicate on the designs, and their decision shall be final, but they do not bind themselves to carry out the design to which the premium may be awarded, or any design which shall be submitted to them. . .
>
> In case no design is carried out no remuneration other than the premium shall be paid to the successful competitor, but he shall, if required, supply specifications and sections *without further payment.*"

We may add that, as is generally the case in competitions of this type, the sum named, 3,500*l.*, is quite inadequate to supply the building demanded, as the committee will certainly find out before they go much further into the matter.

---

[*] See Mr. T. B. Nicol's drawing (to scale) of the west elevation, by Wren, in the *Builder*, September 24, 1898.

**Wanted—Designs for a Church.** THE following letter has actually been received by an architect in London. In forwarding it to us, he says, "I believe that this letter was written in all good faith, but it gives an amusing illustration of the view which I am afraid is held by numerous otherwise well-informed people." We omit, of course, any names which could identify the writer or receiver of the letter:—

> "*Re New Church*, . . . . .
>
> SIR,—As treasurer of the above, I should be obliged if you would forward, without prejudice, to the caretaker of the church at the address, any modern drawing you may have, suitable for a Congregational Church costing between the sums of 3,000*l.* and 10,000*l.* These drawings are for exhibition to the members, and would be required at once; they would be returned to you immediately when finished with.
>
> Should this kind of architecture not be in your way, I should be obliged if you would hand this letter to any one in the profession you think best."

**Modern Gallery, Bond-street.** LIKE the Irishman who fell from a scaffolding, and on being asked if he was much hurt, replied "that he was not dead, but speechless," so we may say at the present time of the art of needlework, that it is not dead, but lifeless. It is either confined to practical ends, or occupies the idle moments of young ladies between education and social duties. No doubt eminent artists have left the beaten track to turn some attention to it, with beautiful results; not enough, however, to revive it, or even put it in a healthy way of life. Like all crafts, it requires the sole attention of serious artists. There are few books on it; there is no public museum for its preservation, except for a meagre collection at South Kensington. It is therefore very interesting to see a fine collection of antique embroidered pictures, mirror-frames, and caskets on exhibition at the Modern Gallery, 175, Bond-street. Ladies of the seventeenth and eighteenth centuries must have had less to do than those of the present day; some of their work ranks high as art, and can only be the result of the greatest industry and patience. There are some rare pieces of Charles I. reign, and one by Queen Anne herself. Landscapes technically are more successful than the figure subjects, the faces of which are executed in pencil and must be the work of eminent miniaturists. South Kensington is making a slight attempt to imitate some of the beautiful little pictures of the eighteenth century; so is Dublin. But students are much hampered in this copying work by the difficulty in obtaining the same materials, and by the fact that some of the most beautiful of the old stitches are lost. There is no doubt that much of the leadwork of Charles I. can never be imitated, but in other respects we are not so far behind our ancestors in the matter of mere execution; it is the inspiration that is to seek. What is wanted is students' interest on the study for its own sake, instinct with sympathy for new materials and new methods, based on a careful and prolonged study of the historic periods of the art.

◆

NEW POST-OFFICE, GREENOCK.—A new Post-office in Greenock has been erected in Cathcart-street, nearly opposite the entrance to the Caledonian Railway Station. The building, designed by Mr. W. W. Robertson, of H.M. Office of Works, Edinburgh, is in the Renaissance style, and, with the ground, cost about 20,000*l.*

## KENSINGTON PALACE.

As the State apartments have been opened this week, we may give a brief account of the buildings. The Palace, standing in the parish of St. Margaret, Westminster, occupies, it is said, the site of Neyte manor-house (belonging to the Abbey), wherein Abbots Litlington and Islip died, the home for a while of John of Gaunt, and the birthplace of John, fifth son of Richard, Duke of York. In 1662 the estate belonged to Sir Heneage Finch—Lord Chancellor, 1675, and Earl of Nottingham, 1681—whose son and successor, Daniel, sold it for 18,000*l.* in 1689 to William III. The greater part of the house was consumed by fire on November 10, 1691. Of the present palace, comprising the Prince's, Princess's, and Clock Courts, and the then "Park," the earliest published survey is, we believe, that by Rocque, 1736. Wren, with Hawksmoor as clerk of the works, designed the south-east block, which contains the Long Gallery, 94 ft. by 21 ft., for William III., and the alcove lately removed from the south end of the Dial Walk to the hollow near Marlborough (formerly Buck Hill) Gate in Bayswater-road*. Hawksmoor carried out some improvements for Queen Anne and King George I. In the reign of the latter, Kent added the east block, with pediment, the entrance corridor, and the grand staircase. Kent's work comprises Queen Caroline's and the King's Drawing-rooms, and the Cupola or Cubic Room (37 ft.); those apartments, together with the Presence Chamber, the Admirals' Gallery, and the staircase, he painted and decorated—as depicted in the coloured views in W. H. Pyne's "Royal Residences," three vols., 4to, 1819. For the coved ceiling of the Presence Chamber he employed the then newly-adopted "Pompeian" style, and put gilt statues of heathen deities in marble niches, with gilt busts above, in the Cupola Room, where is a marble bas-relief of a Roman marriage, ascribed to Rysbrach. The sides and ceiling of the staircase are painted in imitation of a gallery, crowded with spectators, amongst them being Kent himself and two of his pupils; on the ceilings of the Queen's and King's drawing-rooms are, respectively, Minerva attended by the Arts and Sciences, and Jupiter and Semele. Some carvings in the Queen's Gallery and Presence Chamber, and a lime-wood bordure above the chimney-piece of the Queen's Bed-chamber, are attributed to Gibbons. Evelyn says that the private gardens, about 26 acres were laid out by Wise; and in No 477 of "The Spectator," Addison cites the work there of Loudon and Wise. They lay to the north, where some yew trees yet remain, and to the north-west, near the Gravelpits, and are sung by Tickell in his eclogue about Kenna and the elfin King Oberon's palace. The grounds added by Queen Caroline were planted by Kent and Bridgman, the wall along the north side of the gardens (274½ acres) was replaced by Loudon with a railing. Some remains of Nottingham House, including the door bearing the monogram of W. and M. repeated, are in the north block of the palace. Vanbrugh's water-tower, of brick, stood on the Green (or Moor), where also was the conduit-house, with a vaulted roof, demolished in 1871, which Henry VIII. built *circa* 1536 for supplying Chelsea with water; it is illustrated and described by Carter in the *Gentleman's Magazine*, 1815, Part I. In 1893 Messrs. Lionel & Creighton published an account of the six specimens of antique church-plate presented to the chapel by William and Mary, Anne, George I. and George II., the flagon, with cup and cover, being of *circa* 1660, and the helmet-shaped ewer, patens, and alms-dish bearing the several stamps of the famous artificers, George and Francis Garthorne, Henry Herbert, Joseph Allen, and Mordecai Fox. The chapel described in "Old Kensington," by Miss Thackeray, is not the original one, which was replaced during the residence of the Duchess of Kent. Amongst the 660 pictures described by Pyne, and catalogued by West in 1818, we may cite one or two interesting views: Old Hampton Court, by Dankers, Greenwich Palace, *temp.* Charles II., and the Senate House, Venice, by O. Fialletti, with Sir Henry Wotton presenting his credentials to the Doge. At Kensington Palace lived and died William III., Queens Mary II. and Anne, Prince George of Denmark, and George II. It has been the home of the Princess Caroline of Wales; her mother, the Duchess of Brunswick; the Duke of Sussex, who there formed his famous library; his wife, the Duchess of Inverness; and the Duke and Duchess of Kent. In a room at the south-east corner, overlooking the Princess Louise's seated statue of Her Majesty, is a brass tablet, inscribed: "In this room Queen Victoria was born, May 24, 1819."

## WHY AMERICA IS GETTING BEFORE US.

FROM a letter on this subject by Mr. James Keith, A.M.Inst.C.E., which has been sent to us, but which is too long to print in full, we extract the following passages:—

"We, in this country, only really require 'equality of opportunity' to hold our own against the whole world. . . .

It may be quite true that at this moment coal, iron, and steel of as good, if not better, quality can be produced in the United States at cheaper prices than in the United Kingdom—which may be accounted for to a large extent by the absence of royalties and the freedom from restrictions in America, and which are so burdensome on the prime cost of these staples in this country—but even with all this granted, a more valid explanation is requisite for the production of steel bridges, watches, printing machinery, sewing machines, steam pumps, type-writing machines, electric appliances, locomotives, wood-working machinery, agricultural implements, &c., &c., which necessitates the employment of the highest kind of skilled labour, in which the Americans excel, and with which they are now supplying the British and European markets, notwithstanding the high price of labour in the United States.

All the talk about the fault being with the workmen and because of strikes and lock-outs in this country is entirely beside the question and amounts to self-deception on our part, as, in the United States, the workmen are more difficult to deal with and are more unreasonable, while strikes and lock-outs there are of greater magnitude and the consequences are, as a rule, infinitely more disastrous than they are here.

The evil lies far deeper—has been growing for at least twenty-five years, has been increasing rapidly during the past ten or twelve years, and has now got to an acute stage—and that evil is, as has been stated, the lack of equality of opportunity in the United Kingdom. . . .

Invention—which is the life and soul of progress to any nation—instead of being welcomed and encouraged, as it is by the policy of the American Government, is distinctly discouraged and clogged in this country by the policy of the British Government, with the result that invention is still kept at a heavy discount by being taxed at a rate out of all reason, and by being utilised for the mere purpose of reaping a large revenue annually from its most talented and progressive countrymen—the inventors—without giving compensation of any kind of real protection or in even any assurance whatever as regards novelty and validity. The British patent system is a standing disgrace to the country and is incomparable from every point of view almost with the patent systems of Germany and the United States. There is no attempt in the British Patent Office to secure novelty, and when it is mentioned that should two or more identical applications for the same "inventions" be filed the same day and at the same hour at the Patent Office, the Comptroller (unless some outsider, who ostensibly knows nothing about the matter, lodges objections at his own charges), has no power to reject one of them (although the same may be already patented), and the granting of the patents must follow in regular course if the drafting and the drawings, &c., are in order, and the fees be paid; the full value of a British patent may be estimated.

The present Colonial Secretary is mainly responsible for the patent system at present in force in this country, and although since 'The Patents, Designs, and Trade Marks Act, 1883,' drafted and carried through Parliament by the right honourable gentleman, became law, sundry improvements have been effected by outside pressure only, still, the whole system is radically bad, and ought in the interests, not only of inventors, but of the nation at large, to be entirely remodelled on something like the lines of the American patent system, which, though perhaps not absolutely perfect, is the most perfect patent system at the present time in force in any country in the world.

In strong contrast to the policy of our Government, the Government of the United States considers that an encouragement of invention benefits the country and gives a stimulus to the genius and inventive faculties of the people; it very wisely does not attempt to reap a revenue from the brains of its people, but it rather puts a premium on invention—instead of unduly taxing it—by running the Patent Office Department most efficiently but yet as economically as possible. This far-seeing policy enables the American people to take their

## BRISTOL CATHEDRAL.

FOR some little time past, considerable alterations have been made in the neighbourhood of the Cathedral at Bristol, which was formerly the church of the Abbey of St. Augustine. Chief among these alterations has been the making of a new road on the south of the site of the abbey buildings, and the consequent opening-up of views of the monastery hitherto unobtainable. The monastic buildings, now much altered, mutilated, and rebuilt into more modern buildings, have not hitherto appeared very prominently in descriptions of the cathedral and abbey, but some recent discoveries, of which we give illustrations, have called attention to them, and it is much to be hoped may be the means of their being thoroughly investigated. The plan of the cathedral and the cloister court has already been given in the *Builder* Cathedral Series; and the cloister with the buildings on its east side were there shown. Both on the south and west are other buildings, into which remains of the monastic buildings have been incorporated. They consist chiefly of the frater on the south and the scanty remains of a long building, possibly the cellarer's building on the west. This, however, has been much mutilated, and only in the walls of the present deanery, near the south-west angle of the cloister are remains to be seen. The deanery itself apparently is of very early work, and at the south end is an open courtyard approached by a passage from Lower College Green. At both ends of this passage are fine Norman doorways, the western one semi-circular with a later insertion of late fifteenth century date, the eastern one of curious segmental form, perhaps rebuilt with old materials. The passage is 25 ft. long and 14 ft. wide, and is certainly original work of the Norman period. The courtyard is 30 ft. long and about 15 ft. wide. The walls were formerly covered with plaster and rough-cast. This has been removed, and some very interesting details have come to light. The north side is formed by the south wall of the deanery, and near its western end over a simple string-course, Norman lancets have been discovered, one altered in sixteenth century times. Traces of a Norman window are also visible near the north-east angle over a more modern square-headed doorway. The masonry for a few feet above the Norman windows is original; above this is some work of Perpendicular date with several windows of varying size, and the remains of a low-pitched parapet and gable. Both the south and east walls of the courtyard appear to be early work with later windows inserted, and in the east wall is a curious straight-sided arch leading to a passage formerly communicating with the kitchen, frater and lesser cloister. The head of this doorway bears the rebus of Abbot Nailheart (1481-1515), and this rebus with the arms of the Berkeley's also occurs on the western door of the passage (see sketch.) It is therefore probable that the Perpendicular work here is the work of Nailheart, who made considerable additions and alterations to the monastic buildings. The curious segmental form of the Norman arch at the east end of the passage is repeated in two arches south of the chapter-house in the east walk of the cloister, and on the east face of the wall Abbot Nailheart's rebus again occurs.

Of the other monastic buildings, the chief remains are those of the frater (now used as the cathedral school), mostly Perpendicular, but apparently standing on earlier walls. Some traces of Norman work are visible near the south-east corner. To the south of the frater was a second cloister. Of this some fragments remain of the north walls. Eastward are ruins—those of the Bishop's Palace destroyed during the Bristol Riots. There are, however, fragments of Norman and Early English work, and although it is generally said that the Palace was built on the site of the Abbot's lodgings, the ruins are probably those of the infirmary hall, and chapel. South of the great cloister the ground drops suddenly, and the buildings, therefore, were raised on cellarage. This is especially noticeable in the frater when seen from the south.

It is much to be wished that the site of the Bishop's Palace may be thoroughly cleared out. Any doubtful points as to the planning of the building which preceded it would then probably be settled, and give increased interest to the plan of the monastery.

We give illustrations of the western doorway (Norman) of the passages; also two views of the courtyard itself, showing the various features of interest found on the removal of the rough cast. The curious segmental head of the doorway already noted is shown on the left-hand side of the view looking north-west.

## THE PHILADELPHIA EXHIBITION.

THE Philadelphia Exhibition of 1899, the first of its kind in the United States, is to be held under the joint auspices of the Philadelphia Commercial Museum and Franklin Institute from September 14 to November 30 of the present year.

The Exhibition grounds, situated on the west bank of the Schuylkill, comprise a tract of land of fifty-six acres. The grounds are easily accessible, being reached by trolley line within ten minutes' time from the City Hall; also by the Pennsylvania Railroad. Exhibits may be taken into the grounds in the cars in which they are transported.

The main group of buildings will comprise one structure about 400 ft. by 900 ft., and covering an area of more than eight acres. The approach is to be through a broad covered colonnade or porch 160 ft. wide, composed of double rows of columns leading into an open court 275 ft. square. The building west of the colonnade will contain an assembly hall, with seats for 1,200 people, in which will be held the meetings of the International Commercial Congress. From the entrance steps will descend into an open garden, enclosed at the sides by colonnades and ornamented with a central fountain. East of the central building and connected with it will be the Exhibition power-plant. It is adjacent to the Pennsylvania Railroad tracks, affording excellent facilities for landing heavy exhibits. Engines, air-compressors, and dynamo are to be located in one end of the power-house, and in the other the boilers.

A total area of 200,000 square feet of space is available in the main buildings for exhibits, and there is room in the grounds for the erection of such temporary buildings as may be desired by manufacturers, whose exhibits can be more advantageously displayed in separate buildings, and for concessions of amusement or other character.

The foreign buyers in the markets which should be accessible to American goods will find prepared for their inspection, at the Exhibition, an epitome of the products of the United States industries, and samples of similar competing wares from Europe, obtained for the Commercial Museum, for the purpose of comparison and study by American manufacturers, will be displayed. As the Franklin Institute will celebrate its seventy-fifth anniversary in connexion with the Exhibition, it may be anticipated that there will be present a large representation of its widely-distributed membership, embracing engineers, manufacturers, and professional men from all countries. The machinery exhibits, embracing the most improved machines, implements, tools, and labour-saving devices of the United States, will be a comprehensive and interesting group. As far as practicable, these will be operating exhibits.

The main practical object of the Exhibition will be to bring together the American manufacturer and the foreign buyer, whom it is designed to interest in American machinery and products. It is also intended to aid the American manufacturer by showing him how his goods must be packed, labelled, and put up for shipment in order to meet the approval and requirements of foreign trade. The management will, in addition, provide such attractions as will tend to interest the general public and ensure a large and constant attendance.

The Franklin Institute, whose object is the "promotion and encouragement of manufactures and the mechanical and useful arts," is appropriately united with the undertaking. Its history records the successful conduct of twenty-nine exhibitions, beginning with the first exhibition of American manufactures ever held, which took place in October, 1824, the year of its birth, in Carpenters' Hall. The reports and awards of the Franklin Institute are known and prized all over the world, and the grant of a diploma or medal, for the quality and excellence of machinery and products in an exhibition held under its auspices and those of the Commercial Museum, will be a prize of greater significance and value than such evidences ordinarily are.

All communications in regard to the exhibition should be addressed to Mr. W. P. Wilson, Director-General, 233, South Fourth-street, Philadelphia, U.S.A.

◆

NEW THEATRE FOR OLDBURY.—Plans have been passed for the erection at Oldbury, by Mr. Gilbert Osmund, of a new theatre with a seating capacity for 1,000. The architect is Mr. A. Ramsell, of Dudley.

## DERRICK CRANES FOR BUILDERS AND CONTRACTORS.

BY M. POWIS BALE, M.I.MECH.E., &C.

DURING recent years the use of steam cranes for building operations has been very largely extended with a correspondingly increased economy both in time and labour. This is perhaps more particularly noticeable in the erection of large buildings where derrick cranes erected on a tower or platform at the top of the building are now almost universally employed. As the derrick crane may be pronounced the builder's crane *par excellence*, we shall on the present occasion confine our remarks to this type. Although many first-class cranes are on the market it cannot be denied that there are also many indifferent ones; it may therefore be of service to our readers when making a selection if we deal in the first place with some of the chief points to be desired in their construction.

*Steam Derrick Cranes.*—As these cranes are usually fitted with hoisting, lowering, slewing, and derricking motions, and have often to be erected in dangerous places, it is of the utmost importance that they be constructed so as to work with the minimum amount of vibration. To secure this they should be made specially strong and substantial, not only in the framing and jib, but in the gearing and all the working parts, and the workmanship throughout should be of the first class. The centre post or mast should preferably be made of mild steel of ample section, set in a heavy cast-iron bed-plate, truly bored to receive post and turned on top to receive slewing ring and gear. Base-plates are sometimes made of wrought iron, but massive cast iron ones, cast in one piece, are found in practice to give greater rigidity. Crane cheeks made of steel and strongly braced are to be preferred, and the weight and strain of the crane to be carried on anti-friction rollers to secure light and easy slewing.

No overhung shafts should be allowed in the gearing, as they are a fruitful cause of vibration; and this can be readily remedied by fitting a cast-iron bracket on the side of the mast to take the ends of these shafts. All toothed gearing should be of extra heavy section, very carefully made and proportioned, with shafts, intermediate gearing, pins, feathers,

&c., made of steel. Two powerful brakes, capable of holding the full load, should be fitted, one on the barrel wheel and one on the second motion shaft, also safety gear to the derrick barrel. It is important that the hoisting and derricking drums and sheaves of jib be of large diameter (see "Wire Ropes"). All shaft bearings should be of phosphor bronze or good gun-metal, and be adjustable for wear. The hoisting, lowering, slewing, and derricking motions should all be steam-driven, with the lever readily under the control of the driver as he stands on the foot-plate.

As derrick cranes can be readily removed from place to place, are quick in action, and can be arranged to slew to a radius of about three-fourths of a circle, it can be readily seen a large saving may be effected in placing materials in position on a new building, or they may be placed on the ground for quarry work, &c., and the spurs backloaded. They may also be mounted on a travelling carriage, should occasion require, and be traversed by hand or steam; in point of fact, a well designed and constructed derrick crane may be pronounced the most generally useful type for all round builder and contractor's work. Where the crane is required for lifting both light and heavy loads, single and double purchase lifting gear is usually fitted, but where much light lifting has to be done an extra winding drum can be added with advantage. This should be of tolerably large diameter, and with a light steel rope moderate loads may be lifted at a high rate of speed, thus effecting a considerable saving in time over the ordinary gear.

*Engines for Crane.*—The engines usually fitted to these cranes are of the vertical type, with double cylinders, and there is little doubt there is less wear on cylinders placed vertically than in any other position. Single-cylinder engines are unsuitable for hoisting purposes as they are more difficult to start and are objectionable in other ways. The cylinders to be made of best hard cold blast iron, to be steam jacketted, felted, and lagged.

The crank shaft should be of steel, and to secure steady running, balanced disc cranks can be recommended. The link-motion reversing gear should be of substantial construction, and by preference be made of steel, and all joints, pins, &c., should be case-hardened; crank-shaft bearings to be of phosphor bronze and of ample area, as the pressure on them is oftentimes very severe. They should be made adjustable for wear, and efficient lubrication secured.

Piston rods to be of steel, and all glands bushed with gun-metal. Valves, plunger, and eccentric straps for pump to be of gun-metal.

It will be found advisable to provide both a pump, with an injector in reserve, for feeding the boiler in case of a breakdown, the increase in first cost being very little.

*Boilers and Fittings.*—A vertical cross-tube boiler made of Siemens-Martin or equal mild steel plates, double rivetted on the vertical seams, and of ample steaming capacity for the power required. Although they take a little longer to get up steam the writer prefers cross-tube boilers to vertical tubular boilers, as they are more readily cleaned and repaired, and less liable to burn out in case of bad feed-water and incrustation. The boiler should be complete with injector, dead-weight, or Salter's spring balance safety valve, pressure-gauge, protected water-gauge, and all usual fittings and mountings. The boiler and water tank are placed at the back of the base-plate to act as counter-balance, the driver standing in front of it, and care should be taken that the working levers are so placed that the driver can get a good view of the load when lifting or slewing. The boiler should be fitted and lagged or covered with a good non-conducting composition, such as "slag wool," and boxed in as far as may be to protect it from the winds and cold draughts, which are apt to cause leaky seams.

*Slewing Gear.*—In cranes of modern construction gearing is now provided enabling the crane to be slewed in either direction without reversing the engines. It is very important that this motion should come into action without shock, and be readily under the control of the driver. For this purpose double friction cone gearing is now generally employed. With the object also of preventing accidents from sudden stopping or starting, many manufacturers make the slewing roller path or ring loose and separate from the bed of the crane, and it is claimed for this arrangement that under ordinary conditions the pressure of the superstructure of the crane keeps it stationary when slewing; but should there be a suddenly applied shock, instead of breaking the gearing the loose path moves slightly on its seat till the power of the shock is spent. Another advantage of a loose path is that its wear can be equalised by moving it round, and it can be readily renewed when worn out.

*Crane Jibs or Derricks.*—These are usually made either of lattice steel or timber. Chiefly on account of the reduction in weight, the latter is largely employed for cranes to lift moderate weights erected at the top of high buildings. If timber is used, it need hardly be said it should be of the best possible quality, free from defects and thoroughly seasoned. Oak is usually employed for the mast and pitch pine for the derrick, spurs, and sleepers. They should be fitted with heads and shoes, and the head bolts be of ample strength. These latter should be carefully examined periodically, as when subjected to the weather dangerous decay may be going on in the wood and remain undetected. If considerable weight has to be lifted, the jib should be made double and firmly stayed and braced together, and the stays trussed to the sleepers. The diameter of the pulley sheaves and winding drum should in all cases be as large as may be convenient.

For lifting heavy weights a steel lattice-jib, with steel mast, is to be preferred to timber, which answers very well for moderate radius and weights, say two or three tons. A wind brake should be provided for holding the jib in any desired position.

*Wire Ropes for Lifting.*—After a lengthened experience, the writer can strongly recommend the use of special flexible steel wire ropes for lifting and hauling purposes in preference to chain, as being much safer and more convenient. It is very important, however, that the rope be exactly proportioned in size and strength to the maximum load it has to lift. If it is too small it is unsafe, and if too large, and it has to run quickly over sheaves and drums of small diameter, severe bending and other strains are at once set up, and it rapidly deteriorates. There is little doubt that the quality of the ropes is often blamed when the fault lies with the insufficient diameter of the sheaves and drum of the crane. It is now, I think, generally admitted that these should have a diameter not less than 25 to 30 times the diameter of the rope to secure the best results; in point of fact, within reasonable limits, the larger the better. Care should be taken that the rope is kept free from dirt and grit and should occasionally be thoroughly greased with a good lubricant such as black lead and tallow. Ropes may be changed without damage from a smaller to a larger drum, but not *vice versâ*. Ropes are often strained and damaged by suddenly starting and jerking the load; great care should therefore be exercised by the driver to secure a steady and even movement. Ropes should never be allowed to kink or strike against anything when at work or be allowed to get damp or rusty.

Owing to excessive competition numbers of ropes made of improper or inferior steel are on the market. For crane work best quality only should be used; these are manufactured from what is known as "extra plough steel" and made extra flexible. The breaking strain of these ropes—made of six strands with wire core, the centre core being of hemp—per square inch sectional area, is from 110 tons to 120 tons; but, owing to the varying nature of the steels employed, users would do well in all cases to require from the manufacturer a guarantee as regards breaking strains. The margin of safety or safe working load of round steel wire ropes should be one-seventh of the breaking load.

All ropes should be carefully examined and tested at intervals, as the constant bending of the rope over drum and sheaves sets up internal friction between the wire strands, which may become dangerous if worked long undetected. The less the diameter of the winding drum and sheaves the greater the friction; it therefore follows—as elsewhere remarked—that these should be of as large a diameter as possible.

*Management of Crane Boilers.*—Although vertical boilers are very useful in confined situations, the Boiler Insurance Company's returns show that, owing to their construction, they are more liable to deterioration and accidents than other types, consequently they should be very carefully managed and looked after. In the first place, the purest procurable feed-water should be used, and the boiler frequently cleaned, say, once a fortnight, if the feed-water is not good.

In boilers with an internally-fired cylindrical fire-box the water space between the box and shell is usually very confined, and somewhat difficult of access, and is especially liable to become furred up with incrustation; consequently the heat cannot be taken up rapidly by the water, and overheated fire-boxes and accidents from this cause are of frequent occurrence. It will pay well from an economical point of view to keep all boilers thoroughly clean; any incrustation, say, above $\frac{1}{16}$-in. thick should never be allowed to accumulate. Great care should be taken by the attendant in making the mudhole joints, as leakage from these is a fruitful cause of wasting of the plates; also if the boiler is out of use it should be thoroughly cleaned and dried and all ashes and soot removed. If out of use for some time, the fire-box and tubes should have a coat of anti-rust paint. Should slight leakage at any of the seams be discovered, they should immediately be carefully caulked. A frequent cause of deterioration in these boilers arises from overheating of the fire-box crown and chimney tube, especially if the firing of the boiler be forced. To protect the chimney tube, a cast-iron liner is now often fitted, with very satisfactory results.

Should the feed-water be bad, it should be purified before use. In conclusion, the boiler, engine, crane, and ropes should be periodically inspected by a competent engineer.

◆

## BY-LAWS AS TO DRAINAGE OF BUILDINGS.

AT the last meeting of the London County Council, the Public Health Committee brought up the following report, the recommendations being agreed to:—

"On March 21 last we submitted to the Council a series of drainage by-laws[*] proposed to be made under Section 202 of the Metropolis Management Act, 1855, and on the 2nd instant,[†] the Council considered them *seriatim*, and, having amended them in certain particulars, made by-laws number 1 to 7, and 9 to 22.

On By-law No. 8 an amendment was carried to add the following words to Sub-section (iv.), "or if the drains exceed 4 in. in internal diameter of a sectional area not less than that of a pipe of 4 in. internal diameter." The object of this amendment was to allow 4-in. ventilating pipes to ventilate drains of a larger diameter, and on the amendment being carried, By-law No. 8 was withdrawn in order that we might consider the most suitable words to give effect to the Council's wishes. We think that the best method of dealing with the matter would be to add to Sub-section (iv.) as brought up to the Council, a proviso in the following terms:—

> "provided always that such pipe or shaft, if it shall have an internal diameter of not less than 4 in., shall be deemed to provide adequate ventilation for any drain of a larger diameter."

We also wish to point out that By-laws Nos. 4 and 10, as amended by the Council, allow drains, and waste-pipes from lavatories and sinks, to be made of any metal. This, we think, is undesirable, as zinc or other pipes might be used, which might not be of proper weight and strength or might become oxidised and perish very rapidly. The alterations made in these by-laws were agreed to on the understanding that they were only consequential amendments to those made in certain other clauses, but as, on looking into the matter, we find they affect materially the meaning and intention of the by-laws, we hope the Council will allow the former words to be re-instated in the following paragraphs, viz., "cast iron" in place of "metal," in line 4 of paragraph 1 of By-law 4, and "lead, iron" in place of "metal," in lines 4 and 6 of paragraph 1 of By-law 10. Except for these slight alterations the by-laws will remain as made by the Council. In order to give effect to our wishes it will be necessary for the Council to repeal By-laws 4 and 10 and re-enact them altered as suggested.

The recommendations which we therefore make are—(*a*) That the Council do repeal Nos. 4 and 10 of the by-laws made by it on May 2, 1899, under Section 202 of the Metropolis Management Act, 1855. (*b*) That the Council do, pursuant to the provisions of Section 202 of the Metropolis Management Act, 1855, make by-laws numbered 4, 8, and 10 in the terms set out in the appendix to this report. (*c*) That the seal of the Council be affixed to by-laws numbered 4, 8, and 10 as set out in the appendix to this report, and to by-laws numbered 1 to 3, 5 to 7, 9, and 11 to 22, made by the Council on May 2, 1899, under Section 202 of the Metropolis Management Act, 1855."

---

[*] In our issue for April 1 we printed the series of proposed by-laws.—ED.

[†] See our issue for May 6.

### APPENDIX.

4. *Materials, &c., for Drains.*—Except in the case of a drain constructed for the drainage of the subsoil of the site of a building, every person who shall erect a new building shall, in the construction of every drain of such building communicating with a sewer, use good sound pipes formed of glazed stoneware, or of cast iron, or of any other equally suitable material.

He shall not construct any such drain so as to pass under any building, except in any case where any other mode of construction may be impracticable.

*Size of Drain.*—He shall cause every such drain to be of adequate size, and, if constructed or adapted to be used for conveying sewage, to have an internal diameter of not less than four inches.

*Drain to be Laid on Concrete; and Fall of Drain.*—He shall also cause every such drain, whether or not constructed or adapted to be used for conveying sewage, to be laid on a bed of good concrete not less than 6 in. thick, and projecting on each side of the drain to an extent at least equal to the external diameter of the drain. He shall also cause such drain to be laid with a suitable fall.

*Joints of Drain.*—If he shall construct such drain of cast iron jointed with socket joints, he shall cause such joints to be not less than 2½ in. in depth, and to be made with molten lead properly caulked, and he shall also cause the annular space for the lead, in the case of 3-in. and 4-in. pipes, to be not less than ¼ in. in width, and in the case of 5-in. and 6-in. pipes, to be not less than ⅜ in. in width. If such drain be jointed with flange joints he shall cause such joints to be securely bolted together with some suitable insertion.

If he shall construct such drain of stoneware, or material other than metal, he shall cause such drain to be jointed with socket joints properly put together with cement or other equally suitable material.

*Drain to be Water-tight.*—He shall cause every such drain (other than a drain constructed for the drainage of the subsoil of the site of a building) to be so constructed as to be water-tight and to be capable of resisting a pressure of at least 2 ft. head of water.

*Concrete to be Filled in.*—He shall cause good concrete to be filled in so that it shall extend to the full width of the concrete bed already prescribed in this by-law, and so that such drain shall be embedded to the extent of not less than half its diameter.

*Thickness and Weight of Iron Pipes.*—If he shall construct any such drain of cast iron, the thickness and weight of the pipes in proportion to the diameter thereof shall be as follows :—

| Internal Diameter. Inches. | | Thickness of Metal, not less than | | Weight per 9 ft. length (including socket and beaded spigot or flanges —the socket not to be less than ⅜ in. thick), not less than |
|---|---|---|---|---|
| 3 | .... | 5/16 in. | .... | 110 lbs. |
| 4 | .... | ⅜ in. | .... | 160 lbs. |
| 5 | .... | 7/16 in. | ... | 190 lbs. |
| 6 | .... | 7/16 in. | ..... | 230 lbs. |

*Thickness, Sockets, and Joints of Stoneware Pipes.*—If he shall construct any such drain of stoneware or material other than metal, the thickness of the pipes, and depths of the sockets, and the annular space for the cement in proportion to the diameter shall be as follows :—

| Internal diameter, inches. | | Thickness of pipe, not less than | | Depth of socket, not less than, inches. | | Annular space for the cement, not less than |
|---|---|---|---|---|---|---|
| 3 | .... | ½ in. | .... | 1½ | .... | 5/16 in. |
| 4 | .... | ⅝ in. | .... | 1¾ | .... | 5/16 in. |
| 5 | .... | ⅝ in. | .... | 2 | .... | 5/16 in. |
| 6 | .... | ⅝ in. | .... | 2 | .... | 5/16 in. |
| 9 | .... | ¾ in. | .... | 2 | .... | 7/16 in. |

*Drains under Buildings.*—Where any such drain (other than a drain constructed for the drainage of the subsoil of the site of a building) passes under a building, he shall cause such part thereof as passes under the building to be laid, where practicable, in a direct line for the whole distance beneath such building, and to be completely embedded in and covered with good and solid concrete at least 6 in. thick all round.

Provided that in any case where such drain shall be constructed of iron, he shall not be required to cover such drain with concrete, but unless it be carried above ground and also be carried at least at each joint on adequate piers or other sufficient supports, constructed of iron, stone, brick, or cement concrete, it shall be laid on a bed of good concrete in accordance with the requirements of this by-law relating to drains which do not pass under a building.

He shall, whenever practicable, cause adequate means of access to such drain to be provided at each end of such portion thereof as is beneath such building.

*Composition of Concrete.*—He shall cause all concrete used in connexion with any such drain, whether under a building or not, to be composed of clean gravel, hard brick broken small, or other suitable ballast, well mixed with clean sand and good Portland cement in the proportion of one part of sand, one part of cement, and five parts of other material, or with clean sand and good blue lias lime in the proportion of one part of sand, one part of lime, and four parts of other material.

*Inlets to Drains to be Trapped.*—He shall cause every inlet to every such drain, not being an inlet provided in pursuance of the by-law in that behalf as an opening for the ventilation of such drain, to be properly trapped by an efficient trap so constructed as to be capable of maintaining a sufficient water seal. He shall not construct or fix in or in connexion with any such drain, any trap of the kind known as a bell-trap, a dip-trap, or a D-trap.

*Protection of Drain beneath Wall.*—He shall, in every case where any such drain is laid beneath a wall, cause such drain to be protected at the part beneath the wall by means of an arch, flagstone, or iron support, which shall not bear on the drain and shall be of sufficient size and strength to prevent any disturbance of or other injury to such drain.

8. *Ventilation of Drains.*—Every person who shall erect a new building shall, for the purpose of securing efficient ventilation of the drains of such building communicating with a sewer, comply with the following requirements :—

(*i.*) He shall provide at least two untrapped openings to the drains, and in the provision of such openings he shall adopt such of the arrangements hereinafter specified as the circumstances of the case may render the more suitable and effectual.

*Alternative Arrangements.*—(*a*) One opening being above and near the level of the surface of the ground adjoining such opening, shall communicate with the drains by means of a suitable pipe, shaft, or chamber, and shall be situated as near as may be practicable to the trap which, in pursuance of the by-law in that behalf, shall be provided between the main drain or other drain of the building and the sewer. The point at which such opening communicates with the drain shall also in every case be situated on that side of the trap which is the nearer to the building.

The second opening shall be obtained by carrying up from a point in the drains, as far distant as may be practicable from the point at which the first-mentioned opening shall be situated, a pipe or shaft, vertically, to such a height and in such a position as to afford by means of the open end of such pipe or shaft a safe outlet for foul air.

(*b*) In every case where the foregoing arrangement of the openings to the drains may be impracticable or undesirable, there may be substituted the arrangement hereinafter prescribed.

One opening shall be obtained by carrying up from a point, as near as may be practicable to the trap, which, in pursuance of the by-law in that behalf, shall be provided between the main drain or other drain of the building and the sewer, a pipe or shaft, vertically, to such a height and in such a position as to afford, by means of the open end of such pipe, a safe outlet for foul air. The point at which such opening communicates with the drain shall also in every case be situated on that side of the trap which is the nearer to the building.

The second opening, being at a point in the drains as far distant as may be practicable from the point at which such last-mentioned pipe or shaft shall be carried up, shall be above and near the level of the surface of the ground adjoining such opening, and shall communicate with the drains by means of a suitable pipe or shaft.

(*c*) If in any case neither of the two preceding arrangements are desirable, then both the first and second openings may be obtained by carrying up from the points referred to in the previous subsection suitable vertical pipes or shafts to such heights and in such positions that when either acts as an inlet the other may be a safe outlet for foul air.

*Gratings or Covers to Openings.*—(ii.) He shall cause every opening provided in accordance with any of the arrangements hereinbefore specified to be furnished with a suitable grating or other suitable cover for the purpose of preventing any obstruction in or injury to any pipe or drain by the introduction of any substance through any such opening. He shall, in every case, cause such grating or cover to be so constructed and fitted as to secure the free passage of air through such grating or cover by means of a sufficient number of apertures, of which the aggregate extent shall be not less than the sectional area of the pipe or drain to which such grating or cover may be fitted.

*No Bends or Angles in Pipes.*—(iii.) He shall not, except where unavoidable, cause any bend or angle to be made in any pipe or shaft used in connexion with any of the arrangements hereinbefore specified.

*Size of Pipes.*—(iv.) He shall cause every pipe or shaft which may be used in connexion with any of the arrangements hereinbefore specified to be of a sectional area not less than that of the drain with which such pipe or shaft may communicate; provided always that such pipe or shaft, if it shall have an internal diameter of not less than 4 in., shall be deemed to provide adequate ventilation for any drain of a larger diameter.

*Construction, Material and Weight of Pipes.*—(v.) He shall cause every pipe or shaft used in connexion with any of the arrangements hereinbefore specified to be constructed in the same manner and of the same material and weight as if such pipe or shaft were a soil pipe.

*Use of Soil Pipes as Ventilating Pipes.*—(vi.) Provided always, that for the purpose of any of the arrangements hereinbefore specified the soil pipe of any water-closet, or the waste pipe of any slop sink constructed or adapted to be used for receiving any solid or liquid excremental filth, in every case where the situation, sectional area, height and mode of construction of such soil pipe or such waste pipe shall be in accordance with the requirements applicable to the pipe or shaft to be carried up from the drains, shall be deemed to provide the necessary opening for ventilation which would otherwise be obtained by means of such last-mentioned pipe or shaft.

Provided also that any such soil pipe or waste pipe shall, where such soil pipe or waste pipe shall have an internal diameter of not less than 3½ in., and shall in all other respects comply with the requirements as to the position, height, and mode of construction of the pipe or shaft to be provided for the ventilation of any drain, be deemed to provide adequate ventilation for any drain having an internal diameter of not more than 4 in.

10. *Material of Waste-pipes. Traps to Waste-pipes.*—A person who shall erect a new building shall cause every pipe in such building for carrying off waste water from every lavatory or sink (not being a slop sink or urinal constructed or adapted to be used for receiving any solid or liquid excremental filth) to a sewer, to be constructed of lead, iron, or stoneware, and to be trapped immediately beneath such lavatory or sink by an efficient siphon trap, which shall be constructed of lead, iron, or stoneware, with adequate means for inspection and cleansing, and which shall be ventilated into the external air whenever such ventilation may be necessary to preserve the seal of such trap.

He shall not construct or fix in or in connexion with such waste pipe, lavatory, or sink, any trap of the kind known as a bell-trap, a dip-trap, or a D-trap.

*Waste Pipes to Discharge in the Open Air.*—He shall cause every pipe in such building for carrying off waste water to a sewer to be taken through an external wall of such building, and to discharge in the open air over a properly-trapped gully or into such a gully above the level of the water in the trap thereof, or over a channel leading to such a gully."

## CONGRESS OF FRENCH ARCHITECTS.

As already mentioned, the annual Congress of French architects will be held from June 18 to 24, at Tours for the sittings of sections and the usual visits, and at Paris for the distribution of awards and the final dinner. The following is the main scheme of the programme :—

*Sunday, June* 18.—Excursions to Langeais, Rigny, Les Islettes, and Azay-le-Rideau.

*Monday, June* 19.—Two meetings of sections to discuss, respectively, the law of April 9, 1898, on the responsibility for accidents on building work, and the subject of industrial art in the provinces. Visits in Tours, and dinner at Saint-Avertin.

*Tuesday, June* 20.—Excursion to Loches and departure for Poitiers.

*Wednesday, June* 21.—Visits to the curiosities of Poitiers : Notre Dame la Grande, Palais de Justice, Tour Saint-Porchaire, Lycée, Church of St. Hilaire, Gardens of Blossac, ramparts, temple of St. Jean, cathedral, Ste. Radegonde, walk along the river to Montierneux. Departure for Augoulême.

*Thursday, June* 22.—Visits in Augoulême : the Hôtel de Ville (a remarkable work by Abadie), the Theatre, the Carnot monument (by Henri Deglane and R. Verlet), the ramparts, the cathedral (restored by Abadie), St. Auzonne, the public gardens, Beaulieu, various interesting old houses, the chapel of the Lycée, the Prefecture, &c. In the evening, departure for Paris.

*Friday, June* 23.—General meeting of the Caisse de Defence Mutuelle, and visit to the works for the 1900 Exhibition.

*Saturday, June* 24.—Distribution of awards in the Hemicycle des Beaux Arts, and annual dinner.

## *ARCHÆOLOGICAL SOCIETIES.*

BRITISH ARCHÆOLOGICAL ASSOCIATION.—This Association met at the rooms in Sackville-street on the 17th inst., Mr. Compton, V.P., in the chair. Mr. Patrick, hon. sec., announced that the Marquess of Granby had accepted the office of President of the Congress and the Association for the ensuing twelve months. Two very interesting rubbings of incised designs on the headstone of the piscina in the south wall of the Templar's Chapel at Garway, Ross-on-Wye, were contributed by the Rev. Dr. Minos, the Vicar of Garway. They were discovered late last year on removing plaster. On the left side of the piscina is a fish, representing the baptised, and on the right a horned adder, representing the unbaptised. In the middle is a cup marked with a triangle, and raised a little above the top is a cross within a circle; the cup has two wings. Dr. Minos considers this to be emblematical of the exaltation of the consecrated wafer. The second rubbing was of incised work on the inside face of the broken tympanum of the west door of the Templar's Chapel; on the left side is a spear, and near it a ladder; on the right a cup with a cover, and near it a reed and a sponge. In the middle is a TAU cross with a crown over it, three nails and a sword beneath the arms. These clearly represent the instruments of the Passion and the Crown of Glory. The work is rude in character and of early date, probably pre-Norman. Mrs. Collier exhibited a rare volume of the early part of the seventeenth century, entitled "A History of the Gospel," in fine condition, and Mr. Grimsdale photographs of a pair of hand mill-stones recently dug up in a brickfield near Uxbridge. The stones are 14 in. in diameter and were found under about 4 ft. 6 in. of brick earth. A paper contributed by Dr. Russell Forbes on "The Cremating of Cæsar" and the recent "Discoveries in the Forum at Rome" was read, in the author's absence, by Mr. Patrick, hon. sec.

## Illustrations.

### THE NEW BUILDINGS FOR SOUTH KENSINGTON MUSEUM.

We give this week the view of the new façade for the South Kensington Museum, as remodelled by Mr. Webb, and the ground plan, to a larger scale than has yet appeared. We may refer the reader to our remarks on the whole scheme in the second article of our last week's issue; in the course of which we observed that the large-scale plan, now given, would render more clear the modifications made from the original plan, owing to the lines of the site, and the reasons for them.

### LIVERPOOL MUSEUM.

This drawing, which is exhibited at the Royal Academy, represents the west elevation, towards Byrom-street. The three lower rows of windows light the technical schools. Above them are two floors of museum galleries, the upper of which is top lighted.

The work is being executed in an extremely hard sandstone, known as Stancliffe stone, said to be the same as that of which the St. George's Hall is built. Mr. Pomeroy is doing all the sculpture.

The plans of the building were given when we published the competition drawings, under date August 8, 1896.

### CHARD CHURCH, SOMERSET.

Our illustration shows the south-east view of the proposed enlargement of the parish church at Chard, Somerset. At present the church consists of a spacious nave with aisles, transepts, and a very short chancel. To meet the required increased accommodation, it is proposed to double the transepts and lengthen the chancel. The architect is Mr. Roland W. Paul, of London. The drawing is exhibited at the Royal Academy.

### SCREENS, ABBEY DORE CHURCH, HEREFORD.

The two screens enclose one of the chapels of the south transept of the Abbey Church, now known as the Hoskyns Chapel. The family vault is below the pavement, and over it stands the monument of Sergeant Hoskyns, *temp.* Elizabeth, on the sides of which are some elaborate inscriptions and heraldry. The screens are of oak, and on the cornice of the front screen are the date of its erection, the initials of the donor, and the arms of the Hoskyns family. The screens were designed by Mr. Roland W. Paul, of London, and executed by Messrs. Yandle & Sons, of Martock. The shield of arms and its decoration was carried out by Mr. Thomas Martin, of Kennington-road. The drawing is exhibited at the Royal Academy.

### LYCH GATE, WOOTTON FITZPAINE, DORSET.

The lych gate forms the entrance to a new cemetery recently made a short distance from the church, the churchyard having been closed for burials. The materials are oak and Ham Hill stone, and old Ham stone slates have been used for the roof. The work has been carried out by Messrs. Yandle & Sons, of Martock, from the designs of the architect, Mr. Roland W. Paul. The drawing is exhibited at the Royal Academy.

## REGULATIONS AND STANDING ORDERS UNDER THE LONDON BUILDING ACT, 1894.

At the last meeting of the London County Council, the General Purposes Committee brought up the following report, the recommendations being agreed to without discussion:—

"The Building Act Committee have informed us that they consider it expedient that the regulations and standing orders under the London Building Act, 1894, should be revised, in view of the passing of the London Building Act, 1894 (Amendment) Act, 1898, and of the recent decision of the Council to reprint and issue in book form the Council's edition of the London Building Act, and the by-laws in force relative to buildings. The Building Act Committee have carefully gone through the existing regulations and standing orders, and the alterations and additions which they propose are those which their four years' experience of the working of the London Building Act, 1894, lead them to think desirable and necessary.

The new regulations deal chiefly with matters of detail and office routine, and closely follow the existing regulations, but the Building Act Committee deem it expedient that the regulations should be made more stringent in some matters, notably in the case of street formation, with regard to which many difficulties have in practice arisen. With the view, if possible, of preventing similar difficulties arising in future, the Committee propose that the following clause should be added to the regulations under this head—

'Every application for sanction to the formation or laying out of any street, or for the adaptation of any way as a street, must be accompanied by correct and sufficient particulars in writing (which must be verified by production of title deeds should the Council so require) showing how the person on whose behalf the application is made has acquired such control over the land forming the site of the proposed street shown on the plan accompanying his application, as may be requisite to enable him to form or lay out such street, or to adapt such way as the case may be. Such particulars must contain the date of, and the names and addresses of the parties to, the document or documents under which the applicant acquired such control.'

As the regulations are of the nature of standing orders, the Building Act Committee have thought it more convenient that they should be submitted with and at the same time as the revised standing orders.

The present standing orders were framed on the lines of the orders in force under the Building Act of 1855 before experience had been gained of the working of the London Building Act of 1894. The policy of the latter Act is to impose penalties for building, &c., contrary to conditions. Conditions must accordingly be framed in such a way as to enable them to form a basis for proceedings if deviations are made from the schemes approved by the Council. The old conditions rather aimed at making the Council's sanction void if deviations were made, but practice has shown that such deviations might be made at a period when it was too late to take proceedings for building without consent, even if the consent given by the Council were declared void. The Building Act Committee inform us that they have therefore especially framed the new conditions with a view of making proceedings possible at any time when a deviation occurs, and having regard to cases which have arisen in which, owing to some technicality in the wording of the present conditions, the Council has been unable to secure compliance with the plans sanctioned. It may be particularly noted as regards street formation that the evils the Committee have specially had in view and have endeavoured to meet are persons commencing in accordance with sanctioned plans and then stopping and leaving a *cul de sac* instead of completing the street as shown on the plan, or commencing properly and then continuing improperly. The Building Act Committee add that the conditions proposed have been to some extent tried in practice with good results, and the Committee have been able to recommend the Council to sanction schemes subject to such conditions, when, in the usual course, they would have been obliged to recommend the Council to refuse its consent.

Slight alterations have been made in the latter part of standing order No. 238 relative to the fees to be paid to district surveyors in accordance with Section 155 of the London Building Act in the direction of making clearer to the district surveyors the services required of them under the section of the Act referred to, but the amount of the fees remain as at present.

It is not proposed that the new regulations and standing orders (which are set out in the appendix to this report) shall come into force until October 1 next; and until that date, therefore, the existing regulations and standing orders will remain in force.

We agree with the proposals of the Building Act Committee and accordingly recommend:—

'That the Council do make regulations and standing orders in the terms set out in the appendix to this report, under the London Building Act, 1894, and the London Building Act, 1894 (Amendment) Act, 1898, and that such regulations and standing orders do come into force on and after October 1, 1899, and be then substituted for the existing standing orders, Nos. 217 to 238.'

### Appendix.

*Regulations and Rules as to applications for Sanction, Consent, and Licences, &c., under the London Building Act, 1894, and the London Building Act, 1894 (Amendment) Act, 1898.*

The attention of applicants is specially directed to the provisions of Section 194 of the London Building Act, 1894, whereby all applications, plans, and other documents delivered at the office of the Council, on delivery there become the property of the Council.

#### I.—*General.*

Every application (except those under Part XI. of the Act of 1894, as to which see paragraph II. (14) below) must be addressed to the Superintending Architect, County Hall, Spring-gardens, S.W., and must state under which section of the Acts it is made.

All applications must be in writing on foolscap paper, and all drawings (including plans, sections, and elevations) must be on tracing linen of sufficient size to permit of the approval of the Council being endorsed thereon.

The scale to which drawings are made must be drawn thereon and not expressed in words; the north point must be indicated on all plans.

The site must be coloured pink, the proposed building red, existing buildings grey, and any land to be dedicated and left open for the use of the public blue.

The full name and address of the person on whose behalf the application is made and the extent and character of his interest in the property, and whether the property is freehold, leasehold, or copyhold, must be stated. Particulars must be furnished as to the nature of the application and the situation of the street, building, or structure, and the purpose for which such building is required.

All drawings must be in duplicate, and be drawn on the unglazed side of the tracing linen.

#### *II.—Plans, Sections, and Particulars Required in Each Case.* (1) *Formation and Laying Out of New Streets—Adaptation of Ways for Streets and Widenings of Streets* (*see also 13 below*), *&c., Sec. 7 and Sec. 10 of the 1894 Act.*

Plans must be to a scale of 88 ft. to the inch, and must be accompanied by longitudinal sections to the same horizontal scale, but to a verticle scale of 11 ft. to the inch, showing the natural and intended surface levels of the streets (computed from ordnance or some other fixed datum), and by cross sections to a scale of 22 ft. to the inch.

The width of the new street must also be figured.

A key-plan of the locality, showing the surrounding property, must also be sent.

The names proposed to be given to the streets must be submitted; they must be such as are not already in use. An office list of names in use, together with a list of available names, can be consulted by applicants.

In the event of the application being sanctioned, two additional copies of the plans will be required.

In the case of the adaptation of ways for streets or the widening of streets under Section 10, sections will not be required.

Every application for sanction to the formation or laying out of any street or for the adaptation of any way as a street, must be accompanied by correct and sufficient particulars in writing (which must be verified by production of title deeds should the Council so require) showing how the person on whose behalf the application is made has acquired such control over the land forming the site of the proposed street shown on the plan accompanying his application, as may be requisite to enable him to form or lay out such street, or to adapt such way as the case may be. Such particulars must contain the date of, and the names and addresses of the parties to, the document or documents under which the applicant acquired such control.

#### (2) *Buildings (a) within the Prescribed Distance (b) in Advance of the General Line of Buildings, &c., Sec. 13, Sec. 17, and Sec. 22 of the 1894 Act, and Secs. 3 and 4 of the 1898 Act.*

Plans must be to a scale of 22 feet to the inch and must show the situation of the building in relation to others adjacent. The height and precise distance from the centre of the roadway of the proposed building and the width of the street are to be figured.

The names and addresses of the owners and occupiers of the nearest building on each side of the proposed building must also be sent.

In the event of an application being approved, an additional copy of the drawings will be required.

In the case of applications under Sec. 13 (5), the extent and height of the old buildings on the site must be shown to the same scale.

### (3) *Open Space at the Rear of Domestic Buildings, Sec. 41; and Open Space about Working Class Dwellings not Abutting upon a Street, Sec. 42 of the 1894 Act and Sec. 4 of the 1898 Act.*

Plans and sections must be to the scale of one-eighth of an inch to the foot; they must indicate the height of the proposed buildings in every part; there must also be a block plan to a scale of 22 ft. to 1 in., showing the adjoining premises, with the approximate height of any buildings thereon, and in any case where it is desired to extend a building or any part thereof above the diagonal line directed to be drawn by the Act of 1894, the diagonal line and also the horizontal line from which it is drawn must be shown on such drawings.

### (4) *Deviations from Certified Plans of Domestic Buildings Previously Existing on Old Sites, Sec. 43 of the 1894 Act.*

Plans and sections to a scale of one-eighth of an inch to a foot, showing the height and extent of the previously existing buildings, and certified by the district surveyor, must be sent, together with plans and sections of the proposed new buildings to the same scale. The position and approximate height of any adjacent buildings must be indicated on a block plan to a scale of 22 ft. to 1 in. The area of open space to be left and the height of new buildings must be figured.

### (5) *Laying Out New Streets on a Cleared Area, Sec. 44 of the 1894 Act.*

In all cases where the proposed new streets have been sanctioned but not formed the date of such sanction must be specified in any application submitted under Section 44, and every such application must be accompanied by a block plan to a scale of 44 ft. to 1 in., showing the width of all old streets on the area, and the extent and approximate height of all old buildings thereon, together with sections to a scale of one-eighth of an inch to the foot, showing the height of the proposed new buildings.

In any case where sanction has not been obtained to the formation or laying out of proposed new streets upon a cleared area, application for sanction to such streets must be made in accordance with Regulation II. (1), and should accompany any application made under Section 44.

Applications cannot be entertained under Section 44 for modification or relaxation of the previous provisions of Part V., except in respect of either existing streets or streets for the formation of which a sanction has been obtained under Part II. of the 1894 Act.

### (6) *Height of Buildings, Sec. 47 and Sec. 49 of the 1894 Act.*

A block plan to a scale of 22 ft. to an inch, showing the position of the proposed building and of any adjacent buildings, and the width of the street.

Also a plan and sections to a scale of one-eighth of an inch to the foot, showing the height of the several parts of the building.

### (7) *Recesses and Openings in External Walls and Recesses in Party Walls, Sec. 54 of the 1894 Act.*

A block plan to a scale of 22 ft. to an inch, showing the position of the building and of adjacent buildings.

Plans of the floors of the building and an elevation of the wall in which the recesses or openings cocur to a scale of one inch to the foot.

### (8) *Timber in External Walls, Sec. 55; and Furnace Chimney Shafts, Sec. 65 of the 1894 Act.*

Plans, sections, and elevations to the scale of one-eighth of an inch to a foot, together with such details to a larger scale as may be necessary to show the construction.

A block plan to a scale of 22 ft. to the inch, showing the position of the building.

### (9) *Means of Escape from the Upper Stories of High Buildings, Sec. 63 of the 1894 Act.*

A block plan to a scale of 22 ft. to an inch, showing the position of the building and of adjoining buildings.

Plans of the floors above 60 ft. from the street level to a scale of one-eighth of an inch to the foot, and full details of the means of escape to be provided.

### (10) *Projections, Sec. 73 of the 1894 Act.*

In addition to the drawings, &c., required by Regulation II. (2), a plan, section, and side elevation to a scale of one-eighth of an inch to a foot. In the case of the application being approved an additional copy of the drawings will be required.

### (11) *Additional Cubical Extent, Sec. 76; and Buildings for the Supply of Electricity, Sec. 203 of the 1894 Act.*

A block plan to a scale of 22 ft. to the inch, showing the position of the proposed building and buildings adjacent.

Plans and sections to a scale of $\frac{1}{8}$ in. to the foot, showing the height of the building in its various parts.

The use to which the various parts of the building are intended to be put is to be indicated, and any points bearing upon the question of liability to fire.

### (12) *Special and Temporary Buildings and Wooden Structures. Part VII. of the 1894 Act and Sec. 6 and 7 of the 1898 Act.*

Applications must be accompanied by a block plan of the premises, showing the position of the proposed building or structure, and of any adjacent buildings or structures, and also by a plan, elevation, and section of the proposed building or structure to a scale of one-eighth of an inch to a foot, together with such sections and details to a scale sufficiently large to clearly show the construction.

A fee of 5s. must be paid to the cashier of the Council on depositing the application, and a further fee of 5s. on obtaining a notification of the order of the Council, and in no case will the approval or licence be issued until the fees are paid.

Every application for a renewal of an approval or licence for a temporary building or structure for a further period must be accompanied by a certificate from the district surveyor that it has not been altered as to construction or position, and in cases where the building or structure has existed for three years or more, as to its stability for such further period as may be applied for, and also as to any repairs which may be requisite.

In cases where the building or structure has existed for less than three years, and if the inspection be merely to ascertain that the building has not been altered as to construction or position, and to certify that an extension of time may be allowed, a fee of 10s. may be demanded and received by the district surveyor.

In cases where the building or structure has existed for three years or more, and a certificate with regard to structural stability is required, a fee of 20s. may be demanded and received by the district surveyor.

### (13) *Naming of Streets and Numbering of Houses. Part IV. of the 1894 Act.*

Persons laying out new streets or building rows of houses would facilitate their own operations with reference to leases and the numbering of houses required by the Council under the statute by observing the following rules—

St. Paul's Cathedral is recognised as a central point; and the numbering of houses begins at the end or entrance of the street nearest to that building, except where a street leads from a main thoroughfare to a less important street, and then the numbering must start from the main thoroughfare.

Taking, therefore, the sides of a street as left and right (assuming that the back is towards St. Paul's) the odd numbers will be assigned to the left hand side, and the even numbers to the right hand side.

No name is to be used for a street unless with the approval of the Council; and it must be a name consisting, if possible, of one word, with the addition of "street," "road," or other like term, and not already in use within the county.

Only such streets as are leading thoroughfares of considerable length can be designated "roads."

No street under 50 ft. in width can be called an "avenue."

The names "gardens" and "grove" can only be used when the terms seem appropriate.

Names in some way associated with the locality are preferred.

Names for terraces or places, or other blocks of houses, and sections of streets, usually known as subsidiary names, are not recognised.

Any person interested in property affected by any order of the Council for re-naming streets or re-numbering houses, is permitted, on application, to make a copy of the order and a tracing of the plan attached thereto; or a certified copy of the order and plan may be furnished to him on his paying the cost of making the same.

A fee of 1s. is to be charged to all persons seeking information involving a reference to the records with regard to orders for re-naming streets or re-numbering houses.

If a copy of an order and plan be required, there will be a further fee of not less than 1s. 6d.

A more extended plan may be obtained for a larger payment.

Copies of orders and plans are to be made in the superintending architect's department.

### (14) *Dwelling-houses on Low-lying Lands. Part XI. (These Regulations were made by the Council on March 26, 1895, under Section 123 of the London Building Act, 1894, and the Concurrence of the Tribunal of Appeal was duly signified thereto on April 8, 1895).*

Every person who shall be desirous of erecting or adapting any building to be used wholly or in part as a dwelling-house on any land in the county of London, of which the surface is below the level of Trinity high-water mark, and which is so situate as not to admit of being drained by gravitation into an existing sewer of the Council, shall first make a written application for a licence. Such application shall be addressed to the Clerk of the Council.

Such application shall contain a statement as to the nature and extent of the interest of the applicant in the building or buildings proposed to be erected or adapted, and be accompanied by a plan and section of the lowest floor of such building or buildings and the curtilages thereof to a scale of $\frac{1}{8}$th of an inch to a foot, and by a block plan to a scale of not less than $\frac{1}{2500}$ (which may be on a sheet or sheets of the Ordnance Survey, or may be drawn on tracing linen), showing the position of such building or buildings, and the local sewer into which it is proposed to drain such building or buildings, and the connexion of such local sewer with an existing sewer of the Council.

Such plans and sections shall be accompanied by a description of the materials to be used in the construction of such building or buildings, and shall be coloured in accordance therewith. The points of the compass shall be marked on the block plan.

The position and course of the drainage system proposed to be adopted for the disposal of sewage and rain water, and its connexion with the local sewer or an existing sewer of the Council, shall be clearly shown on the plans and sections, and the diameter and inclination of the drain-pipes shall be figured thereon.

The plan and section shall also indicate in figures the level above or below ordnance datum at which it is proposed to construct the floor of the lowest rooms.

The decision given by the Chief Engineer of the Council upon such application shall be reported to the Building Act Committee, and the Committee shall report it to the Council, and thereupon, if it is to the effect that the erection or adaptation may not be permitted, the Clerk of the Council shall by letter inform the applicant that the Council, acting upon the decision of the Engineer, has refused permission. If it is to the effect that the erection or adaptation may be permitted, a licence under the seal of the Council embodying the conditions of the Engineer's decision shall be issued to the applicant.

### *Regulation made by the Council on March 26, 1895, under Section 122.*

It shall not be lawful to place the underside of the lowest floor of any permitted building at such a level as will render it liable to flooding, and every permitted building shall be efficiently and properly drained to the satisfaction of the Engineer for the time being of the Council either into a local sewer or into a main sewer of the Council.

### (15) *Fire-resisting Materials. Schedule II. of the London Building Act, 1894—The Council on March 28, 1899, passed the following Resolution:—*

That the Council do, in pursuance of the powers vested in it by the second schedule of the London Building Act, 1894, approve of the following material as fire-resisting—namely, concrete composed of properly burned coke breeze, free from dust and organic impurities, and Portland cement, in the following proportions, viz., five parts by measurement of coke breeze to one part by measurement of Portland cement, mixed together with clean water to the satisfaction of the district surveyor, when such concrete is used for filling in between the joists of floors, and is filled in to the depth of at least five inches.

## STANDING ORDERS.

### *Conditions upon which Applications may be Granted.*

In dealing with applications made under the London Building Act, 1894, and the Amending Act of 1898, with reference to the under-mentioned matters, the desirableness of imposing conditions to the following effect shall be considered, but this order shall not limit any power to vary such conditions or to impose such conditions in other matters than those mentioned or to impose any other conditions in any matter.

*In the matter of the formation or laying out of proposed streets,* conditions to the following effect:—

(1.) That within from the date of this order the roadway of the proposed street hereby sanctioned shall be clearly defined throughout by posts and rails or so otherwise as the Council shall permit, and be thrown open to the public as a highway.

(2.) That no building shall be commenced to be erected upon either side of such roadway, or upon a site abutting upon such roadway, unless such roadway shall have been and shall still remain so defined and thrown open as aforesaid, and unless such roadway shall have been and shall still remain so made as regards levels, direction, width, and gradients throughout as to comply with the provisions of any statutes and by-laws in force in London regulating streets and buildings, and unless such roadway shall also have been so made and shall still remain as to accord with the plans and sections attached hereto and the particulars which accompanied the application for the sanction contained in this order, and unless the name of the street approved by the Council shall have been affixed and be retained at both ends of the street.

*In the matter of the erection of one-story shops in advance of the general line of buildings*, a condition to the following effect:—

That no part of the proposed shop, or any structure or erection connected therewith, do exceed 16 ft. in height above the footway, or such other height as may be fixed by the Council.

*In the matter of temporary buildings or structures, or wooden structures dealt with under Part VII.*, conditions to the following effect:—

(1.) That the building or structure be commenced and completed within such periods as may be deemed expedient.

(2.) That if the building or structure be commenced or completed contrary to Condition 1, or be found at any time to have been so erected, set up, altered, or adapted, as not to be in all respects in accordance with the application for the approval or licence and the plans and particulars relating to such application, or (when approved or licensed for a special purpose) to have been used for any purpose other than a purpose named in the approval or licence, or to have had any unauthorised addition made thereto, or any word, advertisement, or device made or retained thereon, such building or structure shall, within seven days after service on any owner or occupier thereof for the time being of a notice from the Council requiring its removal, be entirely removed.

*In any matter in which land is to be given up* conditions to the following effect:—

(1.) That before the building is erected or within such period as may be named in the sanction, consent, licence, or approval, the land coloured blue upon the deposited plan shall be dedicated to and left open for the use of the public, and that no pier, pilaster, or other projection be placed on such land.

(2.) That no vault, arch, cellar, or other construction shall be made in or under the said land coloured blue on the said plan without the previous consent in writing of the Local Authority.

*And in all matters* conditions to the following effect:—

That the building, structure, or work be set up, erected, or carried out, as the case may be, and retained without any addition thereto and in exact accordance with the application for the sanction, consent, licence, or approval, and the plans and particulars which accompanied such application.

No sanction, consent, licence, or approval shall be issued until the conditions imposed by the Council in granting the same have been, if the Council so require, accepted in writing by such persons as the Council shall consider the proper parties to comply with such conditions.

Every written acceptance of conditions shall have a sixpenny stamp affixed thereto.

## DIRECTIONS TO BE OBSERVED BY THE COUNCIL'S OFFICIALS IN REGARD TO CERTAIN APPLICATIONS.

### *Formation and Widening of Streets—Part II. of the 1894 Act.*

A copy of each plan for the formation of a new street, or for the adaptation of a way for a street, or for the erection of a building or structure at less than the prescribed distance from the centre of the roadway, is to be sent to the Local Authority in whose district the proposed street, building, or structure is situated, with a request that they will inform the Council within fourteen days whether they have any suggestions to make with reference to such plan, and with an intimation in cases of proposed erection at less than the prescribed distance from the centre of the road, that the communication is to be treated as the Council's communication within the meaning of Section 13 of the 1894 Act of its intention to give the consent applied for if upon consideration of the application it should think it ought to be granted.

Whenever the Council has approved of a plan for the formation of a street to be laid out for carriage traffic, and open at both ends, the applicant is to be cautioned that if at any time, without the written consent of the Council, any posts or other obstructions are placed across the carriageway to prevent the access of carriages, he will be liable to prosecution under Section 199 of the 1894 Act.

Whenever plans of new streets to be laid out for foot traffic only are sanctioned, a condition is to be attached binding the applicant to pave the street over the entire surface, and by posts, bars or otherwise, to prevent such street from being used for carriage traffic.

### *Lines of Building Frontage—Part III. of the 1894 Act.*

On the receipt of an application to erect or extend buildings or structures beyond the general line of buildings, the fact of such application, together with copies or tracings of so much of the drawings accompanying the application as may be sufficient for identifying the property proposed to be dealt with, and explaining the object of the application, is to be communicated to the Local Authority of the district in which the site is situated; and the Local Authority is to be apprised that the Council will be prepared to receive any suggestions they may deem it desirable to make upon the subject within fourteen days; also, a notice that such application has been made, shall be sent to the owner and occupier of the nearest building on each side of the proposed building or structure; and no such application shall be brought before the Committee until after the expiration of fourteen days from the date of such notice.

### *Naming and Numbering of Streets—Part IV. of the 1894 Act.*

Whenever application is made for the re-naming of a street, or the re-numbering of houses, the Local Authority in whose jurisdiction the same may be situated is to be asked to state its views on the subject.

In cases of re-naming of streets, the decision of the Committee shall be reported to the Local Authority, and notice boards shall be attached to two or more lamp-posts in the street for the period of one month, notifying the intention of the Council. At the expiration of the time any protests that may have been received shall be reported to the Committee.

When an order has been made by the Council for re-naming a street or re-numbering houses, an officer responsible to the Superintending Architect is, at the expiration of three months from the transmission of the order to the Local Authority, to inspect the street in respect of which the order has been made, and to report to the Committee any non-compliance with the terms thereof.

Immediately after the making of an order for the re-naming of any street, an intimation thereof is to be sent to the Post Office authorities.

### *Construction of Buildings—Part VI. of the 1894 Act.*

Applications for projections under Section 73 of the 1894 Act are, where such projections extend into the street, to be treated in the same way as applications under Part III. of the 1894 Act.

### *Special and Temporary Buildings and Wooden Structures—Part VII. of the 1894 Act, and Sections 6 and 7 of the 1898 Act.*

A register is to be kept by the Superintending Architect, showing the periods for which temporary buildings or structures or wooden structures are licensed by the Council, and whenever a building or structure is not removed at the expiration of the term specified in the licence, he is to report the fact to the solicitor, who is forthwith to write and caution the holder of the licence, and report the result to the Committee.

### *Dangerous and Neglected Structures.—Part IX. of the 1894 Act. Dangerous Structures.*

When information of a dangerous structure is received, an order to survey shall be immediately sent to the district surveyor in whose district the structure is situated. District surveyors are not to certify unless required to do so, except in cases of imminent danger to life, not admitting of the least delay; all such very exceptional cases are to be specially notified to the Comptroller by the Superintending Architect.

A daily extract of fires, where structural damage has probably resulted, is to be made in the dangerous structures department from the fire brigade return, and the extract is to be forwarded to those district surveyors in whose districts the fires have occurred, in order that they may visit the premises and ascertain if any walls or buildings have been left in a dangerous condition, and take steps accordingly.

On receipt of a certificate from the district surveyor that the structure is dangerous, a notice in the terms of the certificate shall be served on the occupier, or be affixed to the building, and a copy sent by registered letter to the owner, if known.

Accompanying the notice a warning is to be sent that any delay in complying with the requirements of the notice will involve the owner in increased expense.

Where shoring or hoarding is required the owner shall be afforded an opportunity for executing the work when it can be done without risk of accident. In urgent cases, or on the owner's neglect, the manager of the Works Department of the Council shall be directed to carry out the necessary works.

The time to be allowed for works of repair or demolition must be limited according to circumstances.

At the expiration of the time given, the district surveyor is to report whether such works have been executed.

If the owner neglect to comply with the notice he shall, if the structure be in such a dangerous condition as to require immediate treatment, or if he do not within seven days from the service of the notice upon him give notice requiring that the subject shall be referred to arbitration, be summoned before a Petty Sessional Court as directed by the Act.

At the expiration of the time specified in the order, the district surveyor is again to report, stating that the danger has or has not been removed, and if the order shall not have been complied with, the required work shall be executed by the Works Department of the Council, under the supervision of an officer in the Superintending Architect's department.

On the completion of a case the amount for fees payable to the district surveyor shall be made out in accordance with the scale, and that account, together with the account for hoarding, shoring, and other works (if any) shall be forthwith submitted to the Finance Committee.

As soon as these accounts have passed the Finance Committee and been paid, the whole of the expenses incurred in relation to each dangerous structure shall be charged to the owner, and the necessary steps for the recovery of those expenses shall be taken by the Comptroller.

Licences are not to be taken out by the Council for hoarding or shoring, but the manager of the Works Department is in every case, upon the request of the Local Authority, to make good the pavement to the satisfaction of their surveyor, so soon as the hoarding and shoring is removed. The costs and expenses so incurred are to be recovered by the Council from the owner.

### *Neglected Structures.*

Upon receipt of information that a structure is in a dilapidated or neglected condition, an inspection shall be made by an officer responsible to the Superintending Architect, and the result of such inspection shall be reported to the Committee.

When the owner of the neglected or dilapidated structure is known, a communication shall be addressed to him, calling his attention to the condition of such structure, and allowing fourteen days for the repair or removal of the same; and should the works not be commenced at the expiration of that time, a summons shall be applied for.

When it is found necessary to procure evidence from a local source to satisfy the Petty Sessional Court that the condition of the structure is such as to be prejudicial to the property, or to the inhabitants of the neighbourhood, the Solicitor or the Superintending Architect shall be authorised to obtain such evidence.

If, upon the hearing of the summons by the magistrate, an order be made, the Superintending Architect shall, at the expiration of the time allowed by such order, further report to the Building Act Committee. In the event of the order not being complied with, the Committee may instruct the manager of the Works Department to carry out the necessary work.

Mr. Norman Bevan, of the Comptroller's Department, is to act as proxy on behalf of the Council to prove any debt due to the Council on account of, or in relation to dangerous or neglected structures, in cases of bankruptcy or liquidation.

Where the Council has incurred any expenses in respect of any dangerous or neglected structure, and has not been paid or has not recovered the same, and a Petty Sessional Court has (in accordance with Sec. 116) made an order fixing the amount due to the Council, the Comptroller shall give notice thereof to the district surveyor for the district in which the property is situated, and the district surveyor shall be requested to give immediate notice to the Council when any building is about to be commenced upon the site, with a view to the necessary steps being taken to obtain payment of the amount due. The register of such orders [Sec. 116 (3)] shall be kept in the Comptroller's Department.

### *District Surveyors.*

No person shall be accepted as a candidate for the appointment of district surveyor unless he shall have attained twenty-eight years of age and be under fifty years of age, and every such candidate shall deliver with his application satisfactory evidence of his age.

Every candidate shall be required to sign a declaration, and deliver it with his application, that he becomes a candidate, and will accept the appointment, if he should be appointed, on the following understanding:—

(*a*) That he will personally discharge the duties of his office subject to Section 142 of the London Building Act, 1894.

(*b*) That he will give his whole time to the duties of his office.

(*c*) That he will not during his continuance in office (except in the discharge of the duties thereof) carry on business as an architect, surveyor, or builder, or directly or indirectly as a partner or otherwise, be interested in such business.

(*d*) That he will make no claim for compensation in case a diminution of his income shall at any time hereafter arise.

(*e*) That he will keep his district office open from Monday to Friday (both inclusive) between the hours of 9.30 a.m. and 5 p.m., and on Saturday from 9.30 a.m. until 2 p.m., and give his personal attendance there daily from 9.30 a.m. to 11 a.m., and (except Saturday) from 4 to 5 p.m., or at such times (not exceeding two hours a day) as the Committee may from time to time appoint.

(*f*) That he will retire if required to do so on attaining the age of 65, or at any date subsequent to his attaining that age.

The declaration of the appointed candidate shall on his appointment be entered on the minutes of the Council.

The districts are to be re-arranged by the Committee as opportunities may occur, so that the average of the fees received may in no case amount to less than 500*l.* per annum.

The following fees are to be paid by the Council to District Surveyors, in accordance with section 155 of the London Building Act, 1894—

| | | | |
|---|---|---|---|
| On reporting that the roadway of a street sanctioned by the Council has been defined and made throughout, as regards levels, direction, width, and gradient, to comply with any statutes and by-laws for the time being in force regulating such street and to comply with the plans and sections attached to the Council's order sanctioning such street, and that all conditions (if any) attached to such sanction have been complied with | £2 | 2 | 0 |
| On reporting that a way has been adapted as a street, or that a street or way has been widened in accordance with a sanction given by the Council, on an application made under Section 10, and that all conditions (if any) annexed to such sanction have been complied with | 1 | 1 | 0 |
| On reporting that a building, forecourt boundary, or fence has been set back to the distance from the centre of the street sanctioned by the Council under Sections 13 or 17, and all conditions (if any) annexed to such sanction have been complied with, and all land (if any) that should have been, has been added to the public way | 0 | 5 | 0 |
| On reporting that a building, other than a building sanctioned by the Council under Sections 13 or 17 and upon which the District Surveyor is entitled to a fee under these standing orders, has been erected to the line of frontage for which the consent of the Council was given under Section 22, and all conditions (if any) annexed to such consent have been complied with | 0 | 5 | 0 |
| For attending a Police-court to give evidence on behalf of the Council in relation to any of the above matters; for each attendance | 0 | 10 | 0 |

## THE DISPUTE IN THE BUILDING TRADE.

A MEETING of the National Association of Master Builders of Great Britain was held in Birmingham on the 18th inst. Nearly 500 delegates were present. When the last meeting was held in Birmingham it was decided to ask the unions of the various operatives for definite assurances that they had no sympathy with, and would not support, the plasterers, and that if such assurance were not forthcoming by May 6 the question of the terms of a general lock-out should be considered. As the result of inquiries made among the delegates at the meeting on the 18th inst., which was held in private, it was understood that the various operatives' unions had declined to give the assurance asked for. Before the general meeting the members of the council met and passed the following resolution:—"That this council approves of the action of the Yorkshire Federation in locking out their workmen in support of the Hull Master Builders' Association, and also approves of the terms of the manifesto issued by them." At the general meeting Alderman Holdsworth, of Bradford, presided. At the close the Press representatives were informed that the following resolutions had been passed:—(1) "That the proposals as set forth in the letter from the editor of the *Daily News* be accepted as a basis of a conference with the National Association of Operative Plasterers, and the representatives be appointed to attend." (2) "That, in view of the resolution passed at the meeting of the trade unions in Manchester on Monday last, this association will favourably receive any proposal for a conference with the view of an amicable adjustment of all matters in dispute, and that it is desirable such conference should be held before the end of this month." Though a settlement of the dispute has not been arrived at, there are good reasons for believing that matters will be satisfactorily adjusted shortly. The willingness of the parties to meet in conference again, affords ground for hope that a deadlock will be avoided. The conference between the National Association of Master Builders and the National Association of Operative Plasterers will be held on Tuesday next at the Salisbury Hotel, Salisbury-sq., E.C.

## BOOKS RECEIVED.

PAPERS READ BEFORE THE TORONTO ENGINEERING SOCIETY. (The Carswell Co., Toronto.)

# Correspondence.

*To the Editor of* THE BUILDER.

## DUTY OF REPLACING PAVEMENTS.

SIR,—Under this heading, in your last issue, you blame the judgment of Mr. Justice Wills, possibly in consequence of the report of the case being imperfect.

As I was a witness, may I mention that the statement that the work was left "in such a condition that those who use the street can be injured as they walk through" is quite inaccurate? The hoarding was not removed, and thus not only could the street be used without danger, but as a fact was used without any injury to any one by the public for some eighteen months. The facts are interesting, and I think you will like to have them.

Some time after the London County Council had put the hoarding and removed the dangerous portions of the front wall, the claim for the work done and the hoarding was paid for by the owner. Even if before that date the Council could have removed the hoarding, their right to do so now ceased. (I fear to make this letter too long, or I would explain the reasons that I think in any case would have prevented their doing so. In this case danger would have resulted if they had taken such a course.) The owner, a long time after, used this same hoarding in rebuilding a portion of the house. Thereafter it was removed, and the accident occurred shortly after.

I draw no conclusion as to where the fault lay, but it is clear, I think, that the judgment of Mr. Justice Wills was right.

BANISTER FLETCHER.

## ARCHITECTURAL HYGIENE.

### XIX.—HEATING (*continued*).

### 5. STEAM PIPES.

THESE are not used for heating purposes to the same extent as hot water, but where waste steam is available it is convenient and economical to use it for heating. Where power is required in a building for working an engine for trade purposes or for electric light, &c., the same boiler can be used for the heating. Steam coils may be arranged in convenient places, and they are smaller *pro râta* than hot-water coils owing to the high temperature of the steam. Steam heating is somewhat difficult to control, and there is very often a noise caused in the coils. The "low-pressure one-pipe gravity return" method is used considerably in Chicago. Low pressure is there defined as not being more than 15 lb. per square inch above atmospheric pressure. The "gravity" refers to the return of the condensed steam to the boiler, and the "one-pipe" refers to the supply to the radiators of the steam, this same pipe draining off the water arising therefrom. Fig. 228 illustrates this method.* There is, of course, but one valve to each radiator, which, when it is open, allows the steam to enter and the water to pass away; when shut, this radiator cools down without affecting the rest of the system. A person, therefore, cannot misuse the radiator in respect of leaving one valve open and one shut as in the case of the two-pipe system.

The effective system for the utilisation of exhaust or low-pressure steam as a means of heating by direct circulation has been extensively adopted in the United States under the patents of Messrs. Warren-Webster & Co., of New Jersey. The use of exhaust steam as a means of heating in this country has generally been confined to the working of low-pressure hot-water apparatus by means of heaters or calorifers. Under this system there is a considerable waste of steam in many cases, and the difficulties attending the deposit of scale upon the tubes of the calorifers are too well known to require further comment.

The general principle upon which the Warren-Webster system is based is the suction of low-pressure or exhaust steam through the radiators or coils by means of a vacuum pump connected to a central receiver. No matter how remote a point the steam may have to be taken to, the circulation may be relied upon. No air cocks are required upon any radiators or coils; all air and gases, together with the water of condensation, being returned to the central receiver, where the gases escape, and the water is returned as a feed to the boilers. Each radiator or coil is fitted with a thermostatic valve or steam trap of a novel and compact description, exceedingly simple in principle and very effective in working. These valves are fixed on the outlets from the radiator to the return main. While a radiator is receiving its supply of steam, the valve remains closed, but it opens as soon as condensed water collects near the outlet—its action being very sensitive. Short circulating in any part of the system is thus effectually prevented. A special feature of the invention is the practicability of working the return mains from radiators situated below the level of the vacuum pump. With a vacuum of 15 in. it has been found possible to lift the condensed water in a return main with a difference in level of 7 ft. The feeder mains can be run without reference to levels if desired, but a thermostatic valve is required at the lowest point of each dip which may form a loop.

The common assumption that steam at a pressure exceeding that of the atmosphere does more work in heating is based upon the bare theory of the difference in temperatures. Comparing these, we find that while the latter is at 212 deg., a 5 lb. increase only adds 15 deg., or 7 per cent. to the heat supply, while a 10 lb. increase only adds 28 deg., or about 1·4 per cent. per lb. of pressure. As the removal of heat is effected by condensation and is in direct degree due to that condensation, the gain in radiating power must be shown to be greater than 1·4 per cent. per lb. of back pressure, in order to show any economic advantage over atmospheric circulation—this is not the case with the ordinary radiator, which does not so effectively circulate the air over its surfaces as to secure such an advantage.

The special features of the Warren-Webster system may be summarised as follows:—

1. Entire absence of back pressure on engines when exhaust steam is utilised.
2. Continuous automatic drainage of condensation.
3. A thoroughly effective circulation.
4. Absolute control of temperature. The valve on the inlet to a radiator can be closed down to the desired degree, admitting a smaller amount of steam than it is calculated to condense normally. Without any "water hammering" the radiator can then be kept, if desired, at a temperature just above that of the surrounding air, thus attaining that long-sought desideratum—the moderation of steam heating to suit mild weather.

Messrs. James Simpson & Co., of Pimlico, are now carrying out installations on these principles in England.

### 6. HOT-AIR.

This form of heating may be accomplished in two ways, (*a*) by passing fresh air through a furnace and leading it through pipe-ducts to various parts of a building; (*b*) by passing fresh air over a coil of hot-water pipes and using the warmed air for inlet ventilation. The first method is not used to any great extent in this country, but it has its doughty champions across the "herring-pond." The second method is in considerable use, and may often be carried out to advantage. Fig. 229 shows the principles of the systems used in the House of Commons, the fresh air passing through cotton-wool screens and then through hot-water pipes into the air chamber.* It then passes through the floor gratings to the House above. The smoke-flue in the clock tower forms the motive power for the extract. In this system dust particles are driven upwards from the floor and are inhaled into the lamp, and it has many other objections. In fact, it is not considered a successful scheme for the purpose. It is found in practice that the warmed air is advantageously brought in the apartments at a level of some 6 ft. from the floor.

### 7. ELECTRICITY.

The cheerful appearance of an open fire would probably prevent the very extended use of electricity for heating, even if the cost were of no consideration. However, that this may be accomplished with success is undeniable. Fig. 231 shows an electric radiator, which simply requires attaching to the wall-plug of an electric current when it will instantly commence to radiate heat. The electric current, in endeavouring to force its way through the small wire of the radiator, generates great heat, but the wire being buried in enamel, which expands in the same proportion as itself, is not permitted to become a source of danger. Electric cooking-stoves are

*Illustrations to Student's Column.*

constructed on the same principle, and an illustration is shown in fig. 232; there are no fumes or smoke to taint the food being cooked; they are very cleanly, and take up little room. Figs. 233, 234, and 235 show an electric flat-iron, saucepan, and kettle that have been successfully used. Electric hot-plates are also designed and found useful in places where the current is available.

The cost is the great drawback to cooking by electricity, but the time must come when this will be reduced. At 3d. per unit, however, the cost is almost three times as great as ordinary coal for the same purpose, but electrical ironing (see fig. 233) is said not to be more expensive, besides being so much handier in every way. In Edinburgh, where current for heating is 1½d. to 2d., the difference in cost should not stop people from using electricity for this purpose. In country houses where an installation has been put in, it will be found convenient when the current is plentiful to use electric radiators for airing the rooms, &c.; they, of course, are portable, and are very useful for this purpose.

### 8. HOT-WATER SUPPLY.

The same principles as for heating buildings are embodied in the domestic supply of hot water. The pipes should not be of less diameter than 1 in., and for big public institutions are even used up to 2½ in.; they should be of wrought galvanised iron. Lead pipes are apt to sag, and thus impede the circulation. Boilers should have a safety valve attached to a pipe that is not in connexion with the circulation system. There are three systems in use, viz.:—

(*a*) *The Tank System.*
(*b*) *The Cylinder System.*
(*c*) *A Coil Enclosed in a Cylinder.*

(*a*) *The Tank System* is the one that is, perhaps, in more general use at the present time. Fig. 236 shows the principles involved, and fig. 238 shows its application. The feed-cistern, which is controlled by a ball-valve, is fed from the cold-water cistern, and in turn supplies the hot-water cistern, being connected thereto with a siphon. All these are placed at the top of the system. The *flow*-pipe is connected to the top of the boiler, and the *return*-pipe to the bottom. All branch pipes supplying hot water to the various fittings should be connected to both of the above pipes, and should enter the *return*-pipes at a lower level than at that from which they receive the *flow*. Where, however, a fitting is very adjacent to the *flow-pipe* this is not so necessary, as the amount of cold water, to be drawn out of the branch pipe (which, of course, does not form part of the circulation) before receiving the hot water from the flow-pipe, is small. In the case of a bath it is not so material to have the dual connexion. An escape-pipe for steam and air should be carried up above the level of the cold-water cistern, and be connected to the top of the hot-water tank.

The boiler in small systems is generally heated by the kitchen fire, and is of the saddle variety. Where, however, a large supply is required this independent boiler must be used.

(*b*) *The Cylinder System.*—Fig. 239 is now generally recognised to possess some important advantages over the *tank system*, the most apparent being that—

I. The system operates more quickly.
II. Temporary failure of supply does not stop the circulation.
III. More hot water is withdrawn before the temperature is lowered.
IV. Risk of incrustation to pipes is less owing to the shorter circulation of pipes between the boiler and the cylinder.

The principal difference lays in the fact that the reserve of hot water is at the base of the flow-pipe instead of at the top, as in the *tank* system. Care should be taken that the *cylinder* is a strong one, and that its cubical capacity is sufficient for the purpose required.

Either of the above systems may also be used for the dual purpose of heating various parts of the house as well as for the hot-water supply, provided that the boiler is large enough; and a towel-drier of piping in the bath-room should always be provided where possible.

Fig. 244 shows Potterton's combined radiator and towel airer. These are very convenient fixed in a bath-room, and, of course, can be used, if desired, for airing linen.

(*c*) *A Coil Enclosed in a Cylinder* (fig. 240) is sometimes used for heating water supply, and may be utilised with advantage where waste steam is available. As a rule, however, it is not advantageous to use this method if steam has to be generated especially for this purpose. Sometimes hot-water high-pressure coils are used in lieu of steam.

### 9. SAFETY VALVES.

There are, of course, several varieties of valves in use, but probably that shown in fig. 241, which is patented by a Mr. Stainton, of London, is as good as any. It is known as a dead-weight relief valve. The advantage claimed is that, in the case of excessive pressure, the water finds an exit at the outlet A into the supply cistern, and as the water becomes cooled it returns through the inlet B, owing to the reduction of pressure in the pipe.

Fig. 242 shows one of Potterton's patent indicating safety valves, which contain the following improvement:—The spindles of these valves are made of brass tubing, with a small cock connected to the latter, so that water can be drawn from the seating of the valve. If this is done it will indicate that the seating is free from incrustation, because if the seating became fixed by such cause, the hole at the bottom of the hollow spindle would be stopped up and no water could pass. The valve and pipe should, in this case, be disconnected and examined.

Fig. 243 shows a section of Shield's automatic air-valve. It is used for convenience where the usual air-cocks would be objectionable, and is said to be successful.

*Smoke Prevention.*—Fig. 245 shows Messrs. Belcher's prevention of smoke in steam boilers. The apparatus consists of an air-pipe fitted with regulating discs and with various valves and tubes fixed on the exterior of the boiler, by means of which a forced draught of air and steam is introduced into the fire, and by means of a "spreader" in the inside of the furnace the draught is concentrated upon the fuel.

The advantages claimed are simplicity in construction, necessitating no structural alterations to boilers; it is also under perfect control, and enables steam-power users to burn the cheapest fuel and even refuse without producing smoke.

## *OBITUARY.*

**COUNT HENRI DELABORDE.**—The Count Henri Delaborde, permanent Honorary Secretary of the French Académie des Beaux-Arts, and "Commandeur" in the Legion of Honour, has just died at the age of eighty-eight. His first choice in life was painting, which he studied under Paul Delaroche, and he made his first appearance at the Salon of 1836, with a painting, "Hagar in the Desert," which is now in the museum at Dijon. He executed also two pictures commissioned by Louis Philippe for the gallery of Versailles; the "Knights of St. John of Jerusalem," and the "Taking of Damietta." In the Salon of 1847 he obtained a "première medaille" for his "Dante at Verona." But after this he abandoned art for archæology, and became in 1855 assistant curator of engravings in the Imperial Library, and subsequently principal or honorary curator. He entered the Institut in 1868, and was appointed permanent Secretary of the Académie des Beaux-Arts in 1874. His failing health obliged him last year to resign. As a critic and historian of art he leaves a considerable amount of work behind him. Among other works may be mentioned his "Studes sur les Beaux-Arts en France et en Italie"; "Mélanges sur l'Art Contemporain"; "Ingres: Sa Vie et ses Œuvres"; "Le Cabinet des Etampes"; "L'Histoire de la Gravure"; "La Gravure en Italie avant Marc Antonin"; and lastly, "L'Académie des Beaux-Arts depuis la Fondation de l'Institut." Count Delaborde was connected, either directly or by marriage (we forget which) with M. César Daly, the well-remembered founder and conductor of the *Révue Générale de l'Architecture.*

**MR. CHARLES BELL.**—We regret to record the death of Mr. Charles Bell, a well-known City architect and a Fellow of the Institute of Architects. Mr. Bell was successful in some competitions, and carried out a good many buildings of considerable size and importance. Among them may be mentioned the circular ward of the Hampstead Infirmary; the Board schools for Basingstoke, selected in competition; the Northern Polytechnic Institute in Holloway-road, selected in a limited competition in which Mr. Wyatt Papworth was the assessor; Wesleyan churches at Bermondsey, Twickenham and Nunhead, and the completion of the buildings of Kent College, near Canterbury, for the Kent Wesleyan Methodist School Association.

**MR. J. W. H. BEDFORD.**—We regret to announce that Mr. J. W. H. Bedford, Secretary of the Provident Institution of Builders' Foremen and Clerks of Works for twenty-five years, died at his residence, Long Ditton, Surrey, on the 13th inst.

## *GENERAL BUILDING NEWS.*

**MISSION CHURCH, DUNDEE.**—A mission church is being erected by the congregation of St. Paul's Episcopal Church in Blackscroft, Dundee. The new building will be known as St. Roque's Church. The church will be provided with chancel, organ-chamber, vestry, baptistry, and mission rooms. The material to be employed in construction is red brick and stone, with green slates, and the cost is estimated at about 2,000*l.* The architect is Mr. T. Martin Cappon.

**CHURCH, GLASGOW.**—Queen's Cross Church, situated at the corner of Garseube-road and Springbank-street, is one of the first of the mission-planting scheme at present being carried out by the Free Church of Scotland. The plan shows a departure from the ordinary style of mission church, there being only a back and narrow transept gallery, the whole of the area being open to the roof. The passages are so arranged that every one of the congregation has an uninterrupted view of the preacher. The dimensions of the church are as follows:—Area, 71 ft. 6 in. by 43 ft., and the height of the closed-in roof is 41 ft.; transept, 33 ft. by 9 ft., and the chancel, in which the choir and Communion table are accommodated, 22 ft. by 14 ft. There is also provided an organ chamber. The pulpit is situated at the north side of the chancel arch, immediately in touch with a small vestry balancing the organ chamber on the opposite side of the chancel. The baptismal font is built on the ingoing of the chancel arch opposite the pulpit. The accommodation provided is:—Area, 559; back gallery, 160; transept gallery, 71; choir, 30; total, 820. At the back of the church there is a hall capable of accommodating 260 people, the dimensions of which are 34 ft. by 34 ft. and 22 ft. high. At the corner of the street is a tower rising to a height of 56 ft. from the street level, being at the base 20 ft. square and at the top narrowing to 15 ft. It is built of Locharbriggs stone, and roofed with Aberfoyle green slates. The contractors for the work are:—Mason work, Wm. Taylor; joiner work, Wm. M'Call & Sons; slater work, John Anderson; plaster work, Wm. Forbes; plumber work, Jas. Ingleton & Co.; heating work, Hunter, M'William, & Co. The architects are Messrs. John Honeyman & Keppie.—*Glasgow Evening Citizen.*

**BAPTIST BUILDINGS, BROADSTAIRS.**—The new Baptist School-room in Queen's-road, Broadstairs, is now in course of erection and will be used for services until the main building is erected. The building will be of red brick, with stone dressings, from designs by Mr. Arthur H. Clarke, of Broadstairs. The accommodation provides for the school-room, class-rooms, vestries, store-rooms, lavatories, furnace-room, &c.

**CHURCH SCHOOLS, WOLVERHAMPTON.**—The memorial-stone of the new school buildings in connexion with St. Andrew's Church, Wolverhampton, was laid recently. The site, which comprises 1¼ acres of land, is in Gates-street, Whitmore Reans. The buildings now being erected will provide accommodation for 292 girls and 335 infants. It is not proposed at present to bring the boys' department to the new buildings. The total cost is estimated at about 4,000*l.* The builder is Mr. J. Herbert, and the architect Mr. F. Hunter Lynes.

**CHURCH FOR NEW HINKSEY, BERKS.**—The foundations of the western half of a new church for the parish of New Hinksey are now being put in, the estimated cost of this part of the building being 5,000*l.* The architects are Messrs. Bucknall & Comper, of Westminster. The church, when completed, will accommodate 600.

**INTERMEDIATE SCHOOL, BUILTH.**—The new county school at Builth, established under the auspices of the Welsh Intermediate Education Act, was opened recently. The site of the new school covers nearly an acre of ground, and is situate in front of Groe Green. The walls of the building are worked with Llanelwedd stone, and all the dressings are of Hollington stone. The roof is covered with mottled red tiles and plain red cresting tiles. The building is L-shaped, and faces the Groe Green and the new Cross-road. Entering by the boys' porch, out of Cross-road, a wide corridor is reached. On the left are a cloak-room and lavatory, with master's room adjoining, and on the right a large school-room, 40 ft. by 20 ft. 6 in. and 13 ft. 6 in. high, with two fireplaces, and having a movable folding partition for dividing it into class-rooms. At the end of the corridor, facing the entrance, is placed the chemical laboratory. This is 25 ft. by 19 ft. 6 in., with store-room adjoining. There are also a fume chamber and a combustion chamber, with foul air flues, adjoining the laboratory, 20 ft. by 18 ft., on the east side, to be used as a class or lecture room. The entrance for the girls is from the Groe Green-road by a door adjoining the lecture-room. Ascending a stone staircase, 4 ft. wide, the first floor is reached. The girls' school and class-rooms are located over and are similar in size to those of the boys. Their technical room is above the chemical room. This room and the large room are 14 ft. 6 in. high. The rooms on the ground floor, all of which are 13 ft. 6 in. high, are laid with wood blocks, and the corridors on the ground and first floor with Terrazzo marble mosaic paving. The rooms are heated with patent Manchester school grates. The contract was let to Mr. Alfred Meredith, Newbridge-on-Wye, Radnorshire. Messrs. T. Potter & Co., London, were the contractors for the fire-proof flooring; and Messrs. B. Ward & Co., London and Cardiff, for the wood block flooring and the Terrazzo mosaic paving. The plumbing, painting, and colouring work was carried out by Mr. E. Dixon, Builth; the plastering by Mr. D. Evans, Builth; and the gas-piping, &c., by Mr. S. G. Tulk, Builth. Accommodation is provided for 120 children, and the building will allow for further extension when required. The original plans and specifications were by Mr. Stephen W. Williams, architect, Rhayader, while the amended contract, detailed drawings, and specifications were prepared by Mr. Telfer Smith, Builth, under whose superintendence the work has been carried out.

**SCHOOL, CRESWELL, NOTTINGHAM.**—A new school has been erected at Creswell from the designs of Messrs. Brewill & Baily, architects, of Nottingham. The school, which will accommodate 450 children, consists of a central hall, seven class-rooms, cloak-rooms, and lavatories, with master's and mistress's rooms.

**COUNTY SCHOOL, HAWARDEN.**—The Hawarden County School was formally opened on the 18th inst. by Miss Helen Gladstone. The building contract was for 2,450*l.*, exclusive of extras. The new buildings, of red brick, are situated on the main road through Hawarden; they consist of two central class-rooms, divided by a sliding partition, which when removed gives an assembly-room 44 ft. long by 22 ft. wide. To the west of this central block is the boys' wing, consisting of the headmaster's room, class-rooms, and laboratory, with coat-room, and lavatory, and boys' porch. To the east of the centre is the girls' department, while to the south of the central block is a luncheon-room and kitchen, with access by means of covered ways from both wings. Externally the walls are of red Ruabon bricks, with dressings and mullioned windows of red terra-cotta, from Mr. J. C. Edwards's works, and the roofs are of red Ruabon tiles. The arms of the county appear in the central gable. The schools were designed to accommodate fifty-four boys and forty-four girls. The architects are Messrs. Grayson & Ould, of Liverpool, and the contractors Messrs. W. & T. Bailey, of Hawarden.

**COUNTY SCHOOL, FESTINIOG.**—On the 20th inst. the foundation-stone of this school was laid. The structure is to cost about 6,000*l.* The architects are Messrs. Willink & Thickness, of Liverpool, and the contract has been let to Messrs. Hughes & Stilling, of the same city.

**INSURANCE BUILDINGS, GLASGOW.**—A new building for the Liverpool and London and Globe Insurance Company is to be erected at the south-east corner of Hope-street and St. Vincent-street. The buildings are expected to be completed in about a year. They are to be of Locharbriggs red freestone, relieved at points with Peterhead red granite. The frontage to Hope-street is 114 ft. and to St. Vincent-street 64 ft. The distance from the street to the highest point is 120 ft., there being eight stories and a basement. The Liverpool and London and Globe Insurance Company's office is to be entered from St. Vincent-street and it will extend back to the lane, 114 ft. The remainder of the space on the ground floor will be utilised for shops, and the upper floors will consist of offices. There will be two entrances to the upper floors, one from St. Vincent-street with one electric lift, and one from Hope-street with two electric lifts. The builders are Messrs. B. & W. Anderson. Mr. James Thomson is the architect.

**BUSINESS PREMISES, LINCOLN.**—A building, which will be used as a restaurant, has just been erected in Sincil-street, facing the Fish Market. Mr. J. T. Drury was the architect, the general contractor being Mr. Fanthorp and the plumber Mr. J. R. Green.

**COLLEGE ENLARGEMENT, BUXTON.**—A hall is being erected on the site of the tennis lawn on the west side of the present building. The hall is intended for assemblies and classes, and will be connected with the present building by an annexe. The present school-room will be divided up into class-rooms. Mr. Bryden is the architect, and Mr. Oakes the contractor for the alterations and additions.

**THE NEW COLSTON HALL, BRISTOL.**—The Bristol Sanitary Committee have approved of the plans for the new Colston Hall. Messrs. Jones & Cummings, the architects, whose plan took the first premium in the competition, have, in consultation with the directors of the company, introduced considerable modifications into their design. By the purchase of a wide strip of land, the site has been, roughly speaking, lengthened a third. The land secured extends a little beyond the line which will be taken by the new end wall at the back of the organ.

**HOME FOR CRIPPLED BOYS, LONDON.**—On the 19th inst. the Duchess of Albany reopened the Home for Crippled Boys in Margaret-street, Cavendish-square, which has lately been rebuilt. The home, or hospital, was founded sixteen years ago by the All Saints' Sisterhood, and has since been maintained mainly at their expense. Messrs. Lander, Bedells, & Crompton, of John-street, Bedford-row, were the architects.

**THEATRE ROYAL, PETERBOROUGH.**—The plans for the proposed reconstruction of the Theatre Royal, Peterborough, have been passed by the City Council. For some time the management of the Theatre Royal have contemplated the conversion of the present hall into a modern playhouse. The façade of the building will be in the Italian style, and it is nearly 50 ft. in height and 65 ft. in breadth, the centre portion being occupied by two entrances, and these in turn flanked by large double-fronted shops. To bring this about the whole of the present front to Broadway is to come down. One of the entrances is to the pit, and the other to the stalls, the gallery entrance being on the north side. With the exception of the front the three remaining walls will be retained, but considerably heightened. The interior will contain three tiers. On the ground floor the pit will accommodate 466 people, with stalls accommodating 120. On the south side there will be a refreshment bar and dressing-rooms. Above this is the dress circle, which will seat about 120 people, together with private boxes at each end of the circle overlooking the stage. At the rear of the dress circle seats there will be a ladies' room, a crush room, a refreshment bar, gentleman's cloak-room, and on the same level, near the stage, four dressing-rooms, having access by a staircase to the stage below. Above this tier is a gallery, giving accommodation for several hundreds. It is reached by a stone staircase, and, in addition, there is also an iron staircase on the outside of the building, which could be used in case of fire. The architect is Mr. J. P. Briggs, of London.

## *SANITARY AND ENGINEERING NEWS.*

Dronfield Sewage Works.—The new Sewage Disposal Works of the Dronfield Urban District Council, recently opened, have been completed in accordance with the designs of the Council's Engineer, Mr. G. White, C.E., of Mexboro,' and are on the International system, comprising Candy circular upward flow tanks with automatic sludge or detritus removal apparatus, clarifiers and polarite oxidising filterbeds, now popularly termed bacterie beds. The scheme has been carried out in accordance with the plans approved by the Local Government Board, the contractors being Messrs. Margerrison & Sons, of Dronfield.

Public Improvements, Dewsbury.—Colonel March, C.E., one of the Local Government Board Inspectors, held an inquiry at the Dewsbury Town Hall on the 18th inst. into the applications of the Corporation for sanction to borrow money for three separate purposes, *viz.*, for street improvements (Westgate, Wheelwright-street, and Boothroyd-lane), 650*l.*; for electric-lighting extension in buildings, plant, &c., 9,060*l.*; and for a covered market on a site bought several years ago, 3,000*l.* Evidence was given in support of the three proposals by the Borough Surveyor (Mr. H. Dearden) and in support of the second by Mr. O. Jonas, the Borough Electrician.

Drainage and Water Supply Works, Margate.—On the 19th inst. Colonel W. Langton Coke, M.Inst.C.E., held an inquiry on behalf of the Local Government Board, at the Town Hall, Margate, with reference to the applications of the Margate Town Council to borrow 5,440*l.* for works of sewerage, 4,100*l.* for works of water supply, and 1,000*l.* for public walks and pleasure grounds. The Borough Engineer and Surveyor (Mr. Albert Latham) was in attendance.

## *FOREIGN.*

France.—The Société Nationale des Architectes de France has chosen, for its eighth annual competition, the subject, "L'Auberge de Demain," in other words a model design for a modern wayside inn, with every provision for cyclists and motor cars.——It has been nearly decided that next year the two Salons will be organised in the Avenue de Breteuil, on the site of the former abattoirs of Grenelle.——M, Saint-Marceaux, the sculptor, has been commissioned to execute the monument which is to be erected in Père Lachaise to the memory of M. Faure, the late President.——The Council of Paris have decided that the stations at Hotel de Ville, Louvre, and Palais Royal, on the Metropolitan Railway, are not to have any visible buildings above them, in order not to spoil the perspective of the Rue de Rivoli. For the Place de la Concorde, Champs Elysées, and Avenue de l'Alma stations the question is deferred. There is at all events every desire to render the inevitable station entrances as little conspicuous as possible.——The Carnot monument at Dijon was inaugurated last Sunday. It is the joint work of M. Gasq and M. Mathurin-Moreau (sculptors) and M. Vionnois, architect. It consists of a rectangular pyramid in front of which, at half its height, is placed the statue of the late President, in marble. At the sides are two groups in stone, symbolising "La Douleur de la Bourgogne" and "L'Histoire inscrivant sur ses tablettes le nom de Carnot." On the apex of the pyramid is a figure personifying "La Gloire." Behind it is an altar to "La Patrie."——The death is announced of M. Louis Leroux, architect, member of the Société Centrale, and Directeur of Public Works to the town of Turcoing. M. Leroux, who was sixty-five at the time of his death, was one of the most prominent members of the Société des Architectes du Nord. He had built numerous schools and religious edifices, especially the churches of Watrelos, Préseau, Dorigny, and Doulieu. He was one of the competitors in the great competition for the church of Montmartre.——We have also to announce the decease, at Toulouse, of M. Henri Bach, for many years Professor at the Academy of Art in that town. He was an artist with a special knowledge of the art of the thirteenth century, and had been concerned in additions or restorations to several ancient churches of Toulouse. He was eighty-four years of age.

◆

Bristol Master Builders' Association.—Arrangements are being made for the annual excursion of the Bristol Master Builders' Association, which has been fixed for June 27. The visit will be to Bridgwater and the Quantocks. The annual conference of the National Association of Master Builders is to be held in Plymouth on July 18.

## *MISCELLANEOUS.*

Professional and Business Announcements.—Mr. Dennett H. Barry, Surveyor to the Hon. Society of Lincoln's Inn, has removed his offices to 21, Old-square, Lincoln's Inn.——The Surveyors' Institution give notice that they are in occupation of their new building, 12, Great George-street, Westminster, from May 26. Rooms for arbitrations &c., may be secured after May 31.

Demolition of Offices in Throgmorton-street.—We regret to hear of the demolition of Messrs. Capel & Norbury's offices in Throgmorton-street, which were designed by the late Mr. J. J. Cole, and were illustrated in the *Builder* of November 4, 1854. It was a very good building of its period, and is noticeable as being one of the first City office fronts, if not the first, in which polished granite was used as an element of decoration (though whether that is altogether an advantage may be matter of opinion); and Mr. Cole in this building also introduced the feature of carving and enrichment in the reveals of the windows, as a suitable position for decoration in a narrow street.

Northern Architectural Association.—The members of the Northern Architectural Association held an outdoor meeting at North and South Shields recently. The visitors were met at the North Shields railway station by the local representatives, and the company, numbering about thirty altogether, proceeded first of all to the new Board Schools in Coach-lane, North Shields, which have been erected from the designs prepared by Mr. Marshall, of Newcastle. Afterwards they crossed over the ferry to the new Empire Palace. Messrs. Milburn, of Sunderland, were associated with Mr. Frank Matcham, of London, in the designing of this building. Afterwards the party visited the Ingham Infirmary, where Mr. Harry Grieves, the architect, conducted them over the new extensions, and the last place visited was the Mortimer-road Infant Schools, erected from the plans of Mr. J. W. Donald.

Appointment.—The Croydon County Council have elected Mr. G. F. Carter, principal assistant to the Leeds City Engineer, as Deputy Borough Engineer of Croydon. The applications numbered 106.

Kensington Palace-gardens.—On June 27 will be offered for sale, at the Mart, No. 18, occupied by the late Baron Reuter. The house, on the east side, was built upon Crown lands, after the designs of Sir Charles Barry, and has two floors and a basement, with a picture gallery and two towers on the south side; the interior is richly decorated.

Open Spaces, Dollis Hill.—A sum of about 2,600*l.* is all that is now required to complete the purchase moneys for the Dollis Hill estate of 98 acres, to be acquired for 50,000*l.* Contributions have been made by the London County Council, 3,000*l.*; Middlesex County Council, 12,500*l.*; Willesden and Hendon District Councils, 30,000*l.* and 500*l.*; Hampstead Vestry, 1,000*l.*; and the Skinners' Company, 50 guineas.

Painting Work.—In these times when competition is so great architects should not lose an opportunity of seeing that the painting is carried out according to specifications. The painting trade gives many opportunities in all its branches to disregard the specifications and to scamp the work, unless there be an up-to-date foreman or clerk of works, and many tenders are let for this portion of the work at ridiculously low prices, the consequence of which is, to make the job pay, the painter has to get out of a coat of paint here and a coat of size there, and such like tactics, and it is almost impossible for any one, however expert, to be sure whether the work has had three or four coats without the architect specifies a distinct shade for each coat, and each coat to be passed before being painted with the next, and it is greatly the want of care in this department that enables unscrupulous contractors to go in for and take jobs at what is known to be a price that will just about cover the cost of the materials in the full determination of swindling and scamping in every part of the job. Too much care, therefore, cannot be exercised by architects, who should enforce the full letter of the specification and make an example of a few who go in for the cut-throat policy. If this were put into practice it would purify and elevate a trade which has fallen to such a low state, and enable master painters to pay a fair day's wage for a fair day's work. — *The Building, Engineering, and Mining Journal of Australia.*

Memorial Windows, Barnard Castle Parish Church.—The east window, and a window in the chancel of this church have just been filled with stained glass, the work of Messrs. Burlison & Grylls, of London.

## *CAPITAL AND LABOUR.*

Wolverhampton Plumbers' Dispute.—Practically there is no great change in the position of affairs relating to the plumbers' dispute at Wolverhampton. The men's notices should have expired on the 20th inst., but an understanding has been arrived at satisfactory to both sides, which has ended in the notices being extended into June. The Secretary of the plumbers' Wolverhampton branch received a communication from the master builders, who had been asked to receive a deputation of the men, requesting the latter to stay their hand and extend their notices over the holidays. A meeting was called on Friday last, when it was decided, after a lengthy consultation, to grant the request of the masters and extend the notices until June 3. It is said that the plumbing trade in Wolverhampton is very slack at the present time.

Bolton Builders' Strike.—A conference took place on the 23rd inst. between the Bolton master stonemasons and the operatives' representatives, to consider the demand made by the latter for an advance on wages of a penny per hour, and certain alterations in working rules, which would mean an increased cost of production to the employers. In order to avoid a strike the masters offered a halfpenny per hour increase, making the men's remuneration 9½d. This was refused by the operatives. The employers have withdrawn their offer, it is stated, and are determined to resist the men's demands.

## *LEGAL.*

### A BRISTOL BUILDING DISPUTE.

The case of Long and Others *v.* Thompson came before Mr. Justice North in the Chancery Division on the 19th inst., on a motion by the plaintiffs for an *interim* injunction to restrain the defendant until the trial of the action, or further order, from so building adjacent to the plaintiffs' premises, Manilla-road, Clifton, Bristol, as to interfere with the light and air coming to them.

Mr. Vernon Smith, Q.C., who appeared in support of the motion, said that the plaintiffs could not ask for relief upon the ground that their windows were ancient lights, but they rested their case on the ground that the vendor of the houses had derogated from his grant. The houses in question were Nos. 8, 9, and 10, Manilla-road, Clifton, Bristol, and the defendant's house had been put up at the side of them. The defendant's house was up, but he (counsel) should ask for a mandatory order to compel them to pull down, at all events, 5 ft. of wall which had been erected since the notice of motion was given. The plaintiffs were mortgagees in possession of Nos, 8, 9, and 10, Manilla-road; No. 8 was unlet, and had been so for more than two years, but the other two houses were in the possession of a Mr. Crawford. The defendant's house was distant from the plaintiffs only 29 ft. Its height was about 40 ft. to the bottom of the roof and about 36 ft. above the cills of the plaintiffs' basement windows, which were the windows principally affected. The defendant, in putting his house where he had, had deviated from the original plan of the estate, and so created a new road which he called Mortimer-road. The house, if it were allowed to remain up, would seriously affect the light and air coming to the plaintiffs' premises, and he (counsel) submitted that under the circumstances the plaintiffs were entitled to a mandatory injunction. The plaintiffs first knew what the defendant was doing on April 1, and on the 13th complained in writing, and on the 15th the writ was issued, which on the 19th was served on the defendant's solicitor. Subsequently, an undertaking was asked for but refused. On the 21st the present notice of motion was served. On April 22 the defendant put on extra men, and since the service of the notice of motion the wall had been raised by 5 ft. He contended that that 5 ft. ought to come down. The building estate upon which these houses were being erected was the property of Sir Joseph Weston, who in 1888 entered into a building agreement with a gentleman to build certain houses which included the three in respect of which this action was brought. Building plans were prepared which showed the Manilla-road with a road at the back called the Weston-road. The houses in the Weston-road and the Manilla-road had gardens at the back, so that between the backs of the houses, if built in accordance with the plans, there would have been a space of 48 ft. Sir Joseph Weston died in 1895, and since that date his representatives had sold or conveyed to the defendant the property upon which he had erected the house complained of. He had taken up Weston-road, which had already been metalled, and had made instead a road at right angles to Manilla-road, and had the side of his house against the plaintiffs' house. The defendant's allegation was that the plaintiffs had suffered no real damage.

Mr. Henry Jerrell, Q.C., for the defendant, did not deny that when this estate was laid out there was a building scheme, but submitted that when the defendant took his land he took it upon condition that he was not to be tied by the scheme.

After further argument, his lordship, in giving judgment, said the plaintiffs had made out a *prima facie* case of their right to the light on the conveyance, and it was clear defendant had run up the building to the eaves after he had been warned, and after the writ had been issued. Still, he did not intend to make a mandatory order, as he thought it would make very little difference to the plaintiffs at the trial, whilst, of course, it would be a very serious matter to the defendant to pull down a house which was finished, so far as the external parts were concerned. He would accept Mr. Jerrell's undertaking to abide by any order made at the trial, and there would be no order on the motion except that plaintiffs' costs should be costs in the action.

**Order accordingly**

## ARCHITECTS *v.* BUILDER.

AT the Wolverhampton County-court on Thursday last week, Messrs. Manton & Sons, architects, of Wolverhampton, brought an action against Mr. Philip Bowater, builder, Wolverhampton, claiming the sum of 23*l.* 18s. 9d., alleged to be due to them from defendant in respect of certain work done by the plaintiffs in the erection of houses at Wolverhampton between March and September last. Mr. R. A. Willcock appeared for the plaintiffs, and Mr. R. C. E. Plumptre for the defendant. The circumstances of the case as alleged by plaintiffs were that the defendant had received a contract for the erection of some houses for a Mr. Hickman, at Gorsebrook. Plaintiffs were the architects for the work, and prepared the plans, &c.

When the contract was presented for signature by Mr. Hickman and Mr. Bowater respectively, the former refused to sign because the plaintiffs also presented a bill of "extras" for £17 18s. for work done up to that point. As Mr. Hickman declined to pay or sign the contract, the defendant, who had already placed 150,000 bricks on the land, instructed the plaintiffs to transfer the amount of the extras to his own account and he would guarantee the payment.

Mr. Manton, senior, stated that the defendant had paid him 10s. and offered him £5 to settle the matter, but witness refused.

Mr. Plumptre, for the defence, admitted that plaintiffs were entitled to certain sums amounting to 34*l.* 11s., but, as a matter of fact, defendant paid on account to plaintiffs a sum of 56*l.* 19s., so that the plaintiffs were indebted to defendant for the sum of 22*l.* 18s., the overplus of money paid and lent.

A verdict was entered on the main issue for the plaintiffs for 17*l.* 18s. With regard to the counterclaim and several of the charges which were in dispute, those matters were regarded as matters of account and were referred to an arbitrator to decide on the reasonableness or otherwise of the charges involved.

## NETTLETON *v.* DUBIN.

AT the Weston-super-Mare Petty Sessions, held on the 19th inst., Mr. Montague Dubin, builder of that town, was summoned by Mr. Hugh Nettleton, Town Surveyor, for having unlawfully erected, or caused to be erected, certain buildings, without having previously given to the Urban District Council notice in writing of his intention so to do, and without having previously delivered to the Surveyor complete plans and sections of such buildings.

A fine of 3*l.* and costs was imposed.

◆

## MEETINGS.

### FRIDAY, MAY 26.

*Architectural Association (Discussion Section).*—Mr. J. Leonard Williams on "Houses of the Speculative Type."

### MONDAY, MAY 29.

*Royal Institute of British Architects.*—Special General meeting to admit to candidature as a Fellow Mr. Bodley, A.R.A. 8 p.m.

*Surveyors' Institution.*—Annual General meeting, to receive the report of the Council and the announcement of the result of the election of officers (meeting to be held at the new building, 12, Great George-street, Westminster). 3 p.m.

### TUESDAY, MAY 30.

*Royal Institution.* — Professor W. J. Sollas on "Geology." III. 3 p.m.

*Society of Arts (Applied Art Section).*—Mr. J. Starkie Gardner on "The Revival of Tradesmen's Signs." 8 p.m.

*Surveyors' Institution.*—Junior Meetings' Annual Dinner, to be held at the Monico Restaurant, Piccadilly-circus, W. 7 p.m.

### WEDNESDAY, MAY 31.

*Architectural Association.*—Annual Dinner, Holborn Restaurant. 7 p.m.

### THURSDAY, JUNE 1.

*Society for the Encouragement of the Fine Arts.*—Dr. J. S. Phené on "The Schools of Painting of Sicyon and Ephesus." 8 p.m.

*Carpenters' Hall, London Wall (Lectures on Carpentry and Joinery).*—Professor T. Roger Smith on "Timber: Decay and Preservation of." 7.30 p.m.

*Society of Arts (Indian Section).*—Sir Charles Cecil Stevens on "The Port of Calcutta." 4.30 p.m.

### SATURDAY, JUNE 3.

*Edinburgh Architectural Association.*—Annual excursion. Visit to Arbroath Abbey, &c.

*Northern Architectural Association.*—Visit to Chester-le-Street and Lumley.

◆

## RECENT PATENTS:

### ACCEPTED SPECIFICATIONS.

### *Open to Opposition until July 17.*

[1898] 2,089, Frommann, Automatical Opening and Closing of Doors. 8,499, Kittson & Browne, Pigment or Paint. 10,381, Crane, Flushing Apparatus. 10,435, Moulan, Water Meters, &c. 10,719, Balluet, Portable Drilling Machines. 11,640, Heimel, and 15,346, Faure, Accumulators or Secondary Batteries. 12,149, Pease, Roofs and similar Structural Work. 12,365, Walker, Portable Electrical Lamps for use in Mines and other places. 12,550, Purcell, Portable Fire Escapes and Extensible Ladders. 12,872, Adams, Flushing Closets. 13,028, Hamblet & Parkes, Dies and Appliances for making certain kinds of Sewer Blocks, Drain Pipes, Conduits, Channel Blocks, &c. 13,137, de Tunzelmann, Holder for Carrying Carbons or Electrodes for use in Electrical Welding, Brazing, &c. 13,409, Mould, a Combined Boiler, Bath, and Sink, &c. 13,518, Restall, Apparatus for Cleaning and Repairing Drain and other Pipes or Conduits. 13,636, Forbes, 15,423, Bohne, [1899] 5,090, Riemanns, and 6,925, Combier, Acetylene Generators. 13,858, Holland, Guard for Circular Wood-moulding Machines. 13,929, Barr & Thomson, Machine for Cutting Elliptical and other Eccentrical Forms. 13,993, Nall, and 22,144, Robinson, Automatical Guard or Shield for Circular Saws. 14,027, Legros, Self-locking Double-bolt Door Locks. 14,035, Wagner, Raising and Lowering High-hanging Gas Lamps or Lanterns. 14,247, Knoeferl, Slinging and Shifting Cradles, &c., for Builders' Purposes. 14,441, Hueter & Prügel, Boring Holes and Turning Bodies of Angular or Polygonal Shape or Section. 15,327, Russell, Open Fire Cooking Ranges. 15,732, Spanier, Controlling the Supply of Feed Water to Acetylene Gas Generators. 15,989, Barrodale, Aid to Model Drawing. 16,022, Kiefer & Herbst, Bricks. 16,187, Gürtler, Application of Expanded Metal to Constructional Purposes. 16,785, Strong, Gas Heating Stoves. 17,129, Rawlings, Automatical Flushing Cisterns. 17,822, Wells, Pumps. 18,331, Leaver & King, Holders and Fasteners for Sliding Windows. 22,666, Horne, Transparent Map Cases, with a Map cut or Folded to show two Sections at once. 24,956, Smith, Anti-vibrator for Incandescent Gas Lamps. 2,756, Matthias, Thermo-electrical Building Bricks or Blocks. 27,591, Adams, Gas Lighting Apparatus. [1899] 1,616, Moore, Centrifugal Pump. 2,456, Stretton, Pipe Connexions. 2,520, Viggars, Roof Tile. 3,793, Adams, Closets and Flushing Apparatus. 4,886, Greenall, Gas and similar Fluid Meters. 5,088, Farini, Drawing Squares or Triangles for Calculating and other Purposes. 5,111, Schünemann & Rieder, Electrically Operated Gas Tap and Apparatus for Lighting at a Distance. 5,190, Overshiner, Telephone Switch Boards. 5,414, Sidebottom, Ventilating, Humidifying, Warming, Cooling, and Disinfecting Apparatus. 5,572, Hüllstrung, Insulators for Carrying Electrical Line Wires. 5,752, Hartridge, Ash Sifters. 6,101, Winslow, Tread for Stairs and for Manhole Covers. 6,341, Schleicher, Utilisation of Household and similar Waste. 7,247, Galecki, Lopatin, & Lopatin, Manufacture of Bricks, &c., from Lime and Sand. 7,614, Fox & Wright, Safety Appliance for Lifts. 7,644, Boulot, Gas Burners. 7,694, Rust & Lewis, Gas Cookers.

### ABSTRACTS OF PATENTED INVENTIONS.

1,625.—ACETYLENE GAS HOLDER AND GENERATOR: *W. Owens.*—A tube inserted in the lower end of an inclined generator has a number of trays containing carbide, the water passes through a valve, which the bell of the gas-holder opens, and through a trap and a pipe to the trays in succession; the gas escapes to the bottom of a purifier, and after rising amongst a set of baffles, down which the water falls, passes into a dome at the top of the holder; the flow of water can be regulated by means of a cock, when it is desired to recharge the generator, and when the generator is exhausted it becomes filled with water, the water continuing to rise in the trap until it flows into another generator.

1,641.—GAS LIGHTING AND EXTINGUISHING: *A. Firth* —For gas lamps which have pilot jets a clockwork mechanism actuates at predetermined intervals the cocks which control the supply to the main burners. The apparatus—to be placed either in the ground or in the lamp-post—comprises an ordinary timepiece provided with a separate train of wheels. A time disc that rotates once in twenty-four hours carries projecting studs inserted opposite the hours for lighting or extinguishing the gas. At those appointed times the studs engage with a lever which sets in motion the separate train of wheels to move a cock that turns the gas on or off. A pilot jet supplied by means of a by-pass lights the main burner.

1,685.—HOT WATER SUPPLY: *W. H. Bashell & Tubular Bath Boiler Co.*—The invention relates to domestic hot water supply apparatus, and is intended to prevent the boiler and the pipes from becoming incrustated. The water to be heated circulates around a closed coil placed within the hot water cylinder, a tank supplies a non-furring liquid to the boiler, and after circulating in the cylinder the water is drawn off by branch pipes above the cylinder.

1,713.—DRYING FURNACES AND KILNS FOR BRICKS: *W. Tattersall.*—The bricks, being newly moulded, are heated by closing apertures in the walls of receiving chambers, wherein they are dried by the admission of hot air and furnace gases, as regulated by means of valves which control the side openings and of a valve in the chimney, the furnace gases being drawn by a fan and passing through channels beneath the chambers by means of doors, and then forced back into the furnace; when the bricks are hot enough not to crack side-ports are uncovered, and the chimney-valve is opened, thus the hot gases pass into and out of the chambers, whilst moist gases escape through a lower channel into the shaft.

1,750.—PLANING MACHINE FOR THE MITERED ENDS OF MOULDINGS: *R. Simpson.* — The plane-irons are arranged in two sets in the face of the rotary-disc, and are inclined so as to plane when the disc rotates in either direction, as it is driven by an open and crossed belt gearing upon the countershaft, a spring lever moves the reversing-fork which acts upon the pulley-clutch. The moulding rests against the rod-fence, and against one or other of the plate-fences—the fences being fitted adjustably upon the table.

1,753.—LAVATORY BASINS AND BATHS: *J. Gourlay.*—The basin is placed near the end of the bath in such a position that the handles of the supply-cocks and discharge-valve can be fixed in the bracket which supports the basin; the basin discharge pipe may pass to either the bath trap or a separate trap, and a hollow rib in the basin serves for an overflow passage.

1,758.—FIREPROOF FLOORS AND ROOFS: *H. K. Bromhead.*—Joists, of iron or steel, and about 4 in. deep, are laid about 18 in. apart, and blocks are fitted into the intervening spaces; the upper surface is covered with cement, asphalt, or other material, and the lower surface with plaster.

1,769.—FIREPROOF CEMENT AND ARTIFICIAL STONE: *P. Kleber.*—Ground burnt lime and quartz or sandstone are mixed together whilst a spray of diluted hydrochloric acid is directed upon them, and the plastic mass is then moulded into building blocks or other shapes, the acid is evaporated from the blocks within a steam-tight drum until a pressure equal to about seven atmospheres is obtained, the stones will be ready for use after exposure to the pressure during some hours, and the artificial stone thus formed may be finely ground for a cement.

1,818.—ATTACHMENT FOR DOOR-KNOBS AND HANDLES: *H. M. Williams.*—One knob, or handle, is secured to the spindle in the ordinary manner, the other has a locking plate mounted within its recess, which engages with the ratchet teeth upon the spindle, and is held in position by a flanged collar that is moved into place by the insertion of the plate and is then screwed on to the door.

1819.—MANUFACTURE OF CALCIUM CARBIDE: *J. W. Kelly & H. Roantree.*—The electrical furnace is provided with a brickwork bottom, roofs, and walls, an inclined floor, a coloured glass sliding-door, carbon electrodes raised upon blocks near their inner ends, and outlets; between the carbons is fed a shaped block composed of about equal parts of chalk and lime and coke, or coal breeze, the generated gases, carbonic oxide and acid, escaping through a top opening, may be collected and burned to form carbonic acid; the carbide falls down the inclined floor to its own outlet.

1,932.—TRAPS FOR SEWERS AND DRAINS: *A. T. Chorley.*—A division, triangular in section, is made across the siphon-chamber. The inlet is formed socket-wise and the outlet is formed spigot-wise. Stoppers close the openings for cleansing purposes, and a stopper, cemented in, closes the top opening if it has not a ventilating pipe.

2,003.—CERAMIC STONE: *L. A. Garchey.*—The inventor pulverises and sifts certain vitrifiable materials, such as waste glass, slag, scoriæ, potter's and other clay. If clay or other material not readily fusible is used, the mass is agglutinated with a silicate or gum to form a paste. The devitrification is effected in a furnace at a temperature below the fusing point of the materials, and suitable dies are used to finally shape the moulded articles.

2,032-3.—WRENCHES AND PLIERS: *J. Pusey.*—For wrenches, a jaw pivotted to the handle and a jaw which slides on the stem fixed to the former jaw grip the nut, or pipe, &c. The latter jaw being acted upon by projections upon the forked handle, when the handle's motion is reversed the sliding jaw is pressed back by a pin upon the handle. For parallel pliers, one jaw is pivotted to the handle, which has a pin that enters a slot in the other jaw fixed to a solid or forked bar, which slides in a slot, or slots, in the former jaw; by employing a thumb-screw running in a slot, the pliers may serve for a hand-vice.

2,106.—ARC LAMPS: *J. O. Girdlestone & C. F. G. Thorkelin.*—Rods, pinned to insulated supports, carry the globe and lower carbon, and can be turned up outside the globe in order to release the latter and its top, which is held by a spring; or the globe may be held by a spring upon the lower carbon-holder, the carbon and globe being carried by rods which hang, inside the globe, from a plate fixed apart from the lamp's casing; the carbon-holder is guided by rollers within a central tube, whilst a plate guides the carbon; a cord from a drum upon a shaft provided with a brake pully and controlled by a coiled spring, supports the upper holder; around the pully is a strap connected with a brake lever and with a regulating lever that carries cores in series and shunt coils; the lamp is adapted for use upon any circuit.

2,153.—VENTILATION OF DRAINS: *J. Hutchison.*—Concentrical pipes, connected by webs, are fitted on to the upper end of the ventilating pipe at the ground level, the air passes through the grating to the space around the inner tube, which may be converted into use as a silt-box by means of a removable disc resting upon the bottom flange In modified forms the silt-box assumes the shape and place of either an annular or a side chamber.

## TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at public meetings, rests, of course, with the authors.

*We cannot undertake to return rejected communications.*

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

We are compelled to decline pointing out books and giving addresses.

Any commission to a contributor to write an article is given subject to the approval of the article, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and *not* to the Editor

## TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us *not later than* 10 *a.m. on Thursdays.* N.B.—We cannot publish Tenders unless authenticated by the name and address of the sender; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is given, nor any list in which the lowest Tender is under £100, unless in some exceptional cases and for special reasons.]

* Denotes *accepted.* † Denotes *provisionally accepted.*

## *A Book on Westminster Abbey.*

WESTMINSTER ABBEY has acquired such an exceptional position as the historical shrine of the nation, that comprehensiveness has come to be regarded as its special characteristic. We wish that this, the latest of works upon the subject,* had shared in that quality, for there is room for a treatment of the Abbey as a whole up to the present day, without any slurring over or omission of all that has been done since the sixteenth century. Incongruous as many of the additions of a later date have been, they are in the main *bonâ-fide* representations of the art, and often of the very best available, of each subsequent generation, and as far as the monuments are concerned there are among them works which would command admiration in another position. There is no standpoint from which the Abbey can be properly regarded as the product of even one century, and it becomes hardly possible to logically condemn the eighteenth century sculptor for cutting away the arcading of Henry III. when we find the latter's architects clearing away the old church of the Confessor. It is wiser to accept this great deposit of history as it stands, and let it be a temple of silence and reconciliation for the clashing standards of taste as well as of policies and creeds.

The backbone of the present book consists in a fine collection of photographs by Messrs. Bolas, of the buildings and monuments, seventy-five in all, with two diagram plans and two sections by Mr. Micklethwaite, to illustrate the successive dates of the building. The text consists of three sections: historical, by Mr. Henry J. Feasey (sixty-two pages); architectural, by Mr. Micklethwaite (twenty-seven pages); and a third on the mediæval monuments by Mr. Edward Bell (thirteen pages). A certain unavoidable want of unity results from the separation of the two first sections; the reader has an uneasy feeling that one account may not exactly bear out the other in regard to dates, while a certain amount of repetition is inevitable. In reality, two different classes of readers may be said to be catered for, and Mr. Feasey, addressing the more popular audience, glides rapidly over the historical part, especially after the mediæval period, one half-page taking us from the Henry VIII. to the Diamond Jubilee, in a concluding paragraph that closes too rapidly the long perspective of the Abbey as one of the centres of English life. In dealing with the dissolution of the Abbey the writer launches out into a eulogy of the monks that gives rise to the supposition that the order of St. Benedict suffered for the sins of others, otherwise it is difficult to understand how the extinction of so valuable a community was acquiesced in by the nation.

Mr. Micklethwaite is more philosophical, and scientifically traces out the gradual alteration in the habits of the monks from common to individual living, the change exercising a marked influence on their architectural surroundings. After pointing to the Roman country house as the derivative of monastic buildings, he says:—

> "The essence of the monastic plan, as was that of the villa, is the square enclosed court with portico round, which formed at once the general living place and the approach to the various apartments arranged round it."

While he looks on the chapter-house as the successor of the Tablinum.

The many religious houses founded in England during the twelfth century met, he tells us, a real want.

> "They were crowded with monks more quickly than they could be built. But this did not last long. After the middle of the fourteenth century there were scarcely monks enough to occupy the buildings; and at the suppression in the sixteenth we find but twenty or thirty in a house built for the accommodation of hundreds. With the decrease of numbers came an increase in the importance of the individual monk—he became a dignitary, and his abbot a prelate. The life of a Benedictine in the fifteenth century was more that of a canon than that of a monk, according to the ideas of earlier times, and the resemblance was increased by all monks receiving holy orders, which had not been the ancient custom. The essence of the Benedictine rule was the common life, but at last this was quite lost in some places. As early as the twelfth century the abbots of the greater Benedictine abbeys lived apart in their own houses, and had their separate property, as indeed their position as great secular lords compelled them to do. Then other officers, in gradually increasing numbers, had their separate apartments, and the custom which there was of assigning money to special offices put money into their hands, any balance of which, after the calls of their office had been met, seems to have been at their own disposal. Then we find ordinary monks receiving pensions out of the common property, and owning money and goods, some of them being rich men who are recorded as benefactors of their own churches. From this to the provision of a separate dwelling for each man is not far, and it was certainly reached in France in the seventeenth century. I cannot positively say that it was in England in the sixteenth, but I much suspect that it was at Westminster, where there were many private apartments, some of them being complete houses."

The provision of private apartments began with the Infirmary, which was a place not only for the sick but for all those who through old age or for other causes were not able to take their part in the duties of church and cloister; and the readiness with which some of the monks found excuses for residing in the Infirmary was a subject of contemporary satire. At Westminster the Infirmary was done away with altogether, and its place taken by a number of separate houses ranged round a cloistered court.

> "A like change seems to have been made in the dorter. Originally it was a long open gallery, in which the beds were arranged in rows. Then the cubicles became chambers, and at Westminster and some other places a number of houses and chambers were crowded round wherever there was space outside the dorter, with doors from it to satisfy that clause of St. Benedict's rule which says that a monk must always sleep in the common dorter."

Mr. Micklethwaite points out the traces of these alterations at Westminster, and regrets the destruction of blocks of chambers to which he ascribes an earlier date than had been hitherto given to them.

---

* "Westminster Abbey Historically Described." By Henry John Feasey. With an account of the Abbey Buildings by J. T. Micklethwaite, V.P.S.A., Architect to the Dean and Chapter. An Appendix on the Mediæval Monuments by Edward Bell, M.A., F.S.A. And seventy-five plates. London: George Bell & Sons, 1899.

The prominence given in this work to the monastic buildings emphasises what we are apt to overlook in the present day pre-eminence of the church itself—namely, that the latter was, after all, only the leading apartment in a group of buildings devoted to a special purpose, and that in a sense, in early times at any rate, the focus of the life of the community was to be found in the cloister.

> "The building of an abbey, though laid down from the first on a regular plan, often took many years. . . . . The ordinary course seems to have been that on settling in any spot the monks made use of any shelter they could get, and then cleared the ground and set out their future house as they hoped to build it, and put up temporary wooden buildings in the places of the permanent ones, which where then built quickly or slowly, according to the means of the house or the generosity of its benefactors. . . . ."

The further progress of the house may be summarised as follows:—The church came first, generally the eastern half only, to accommodate the services; then the cloister and the "regular" buildings round it. If the nave of the church was not finished, enough of its wall next the cloister was built to allow of the completion of that walk, usually the north. Next came the east side, with the chapter-house and monks' cloister. If the nave of the church had not been finished before, it was generally gone on with after the completion of the square of the cloister. Then the Infirmary was built towards the east, and last the buildings and the outer court towards the west, guest houses, workshops, stables, and the like, many of which remained wooden buildings at the Suppression. Bearing in mind these general lines, the historical development of the Abbey can be traced out with real interest and profit, because we see the architects of those ages proceeding on lines of natural growth and governed by the necessities of providing accommodation varying with each generation, hampered by the same restrictions of older buildings, continuous occupation, and want of funds, such as we know so well in our present day practice. Thus the history of the Abbey becomes no longer a matter of dry dates and dead royalties, but the solution of a series of interesting problems in an artistic manner.

Looking first at the site, Mr. Feasey endeavours to give us a picturesque account of the spot on which the Abbey was founded, the exact facts of which are difficult to distinguish from fiction. As with so many great buildings, the existing one is but a link in a long chain of occupants of a site marked out by some natural advantages from the first. As with St. Paul's, we have the tradition of a heathen temple preceding the church; while the mythical consecration by St. Peter, 610 A.D., is told at length and ascribed to the thirteenth century. Coming to actual facts, we have a genuine charter of 785 A.D., by Offa, King of Mercia, who had founded St. Albans in the preceding year. Mr. Feasey regards it as tolerably certain that King Edgar (958-975) and St. Dunstan, by bringing twelve monks, probably from the Benedictine Monastery of Glastonbury, and planting them at Westminster, practically founded the Abbey, although down to the time of the Confessor it does not appear to have been in anything like a flourishing state. This may be ascribed in part to the Danish rule of twenty-eight years, which ended in 1042, when Edward the Confessor came to the throne.

> "There are foundations under the turf of the north green some of which may belong to the earlier Saxon abbey, but there is nothing of which we can be sure, and we do not know even whether its buildings were of stone or wood."

The Confessor took up his abode close by, building a palace, the remains of which existed up to the Great Fire of 1835. He then turned his attention to the building of the Abbey. Mr. Feasey considers it probable that the Abbey had a twofold character, namely, that of Royal chapel attached to the new palace, and that of church of the ancient Benedictine monastery, the pious inclinations of the King marking it out as his prospective burial-place. The unique character of the building was thus early determined, while it is singular that the last characteristic, that of a great burial-place, should have come with time to predominate over the two former.

The Confessor's buildings are described as in a mode of construction then a novelty in England, *i.e.*, in the Norman style; the older Romanesque, of which a few nearly complete examples still exist, as at Bradford-on-Avon, Worth, and Escombe in Durham, having been hitherto the fashion of all English churches. Nothing now remains of this Norman church save the remnant of one of the choir piers on the north side (which can be seen by raising a square trap in the floor of the sacrarium), and a doorway high up on the southern face of the transept, together with some portions of the monastic buildings. The church as then built was cruciform in plan, comparatively low in height, its eastern portion terminating in a semicircular apse. It also appears to have had a massive central tower, with a couple of towers at the west end.

There are two descriptions of the church, the earlier written immediately after the death of Edward, when his work was scarcely finished, and the other about 1245, when the work of rebuilding was already begun. Both are printed in Dr. Luard's volume of "Lives of Edward the Confessor" in the Rolls series.

The earlier one was addressed to Queen Emma, and is described as certainly not later than 1074, when she died. Mr. Micklethwaite remarks that the passage is full of difficulties, as to the obscurity of an uncertain text and an inflated literary style must be added the writer's ignorance of the terms of building. His rendering of the passage is as follows:—

> "The main building is rounded, and built with very high and uniform arches of ashlar work. And the aisle enclosing that part is strongly vaulted with a double arch of stone springing from either side right and left. Then the cross of the church, which is contrived to go over the middle of the choir of the singers of the Lord, and by its double abutment on one side and on the other to support the lofty top of the central tower, starts first with a low and strong arch, then spreads out with many winding stairs, artfully going up, and is continued with plain walling up to the wooden roof, which is well covered with lead. Below and above, chapels are put out to be consecrated by their altars to the memories of apostles, martyrs, confessors and virgins. All this vast and complicated work was placed far enough eastwards of the old church for the brethren using it not to be interrupted in service of Christ, and also that there might be a sufficiently spacious approach between them."

Sir Gilbert Scott thought the description to mean that the aisles were vaulted at two levels—that is, above the triforium as well as above the ground story. Our author thinks that it is only an involved attempt to describe a vault by a writer used to arches only. The Bayeux tapestry picture is regarded as uncertain, but it is pointed out that the four angle turrets of the central tower are made very conspicuous, while the lower turrets shown may be those at the outer angles of the transepts. Chapels in two stories opening off the triforium exist at Gloucester; the description implies that they had not yet been consecrated.

> "The new work was built eastwards of the older Saxon church, which continued in use by the monks during the building; and afterwards it seems that they were joined by what is called a spacious intervening vestibule, so that the old became the nave, and the new the choir of one church."

More than this, Mr. Micklethwaite maintains, cannot have been done by the Confessor.

Whether while the choir was in building other works were begun by the Confessor is uncertain. There is early Norman work all through the building on the eastern and northern sides of the cloister, and it has usually been attributed to him. Mr. Micklethwaite argues that as he left the Abbey well endowed, the work need not have stopped at his death, and that it is likely that the choir was first of all got ready, and then that the other buildings were gone on with. The next step was to take down the old Saxon church, and to build a nave corresponding to the Confessor's choir. This had western towers, and Mr. Micklethwaite throws out the interesting idea that the peculiar form of the lower part of the present towers, which many students must have noted, may be due to inheritance from their predecessors, and even that some of the older work may be hidden beneath the present casing. The building of the nave was a great work, and probably took many years. It seems to have been finished about 1150. A space of seventy years brings us to the laying of the foundation-stone of the old Lady Chapel by Henry III. when a boy of thirteen. This was the work of the Abbey aided by the subscriptions of the outsiders, to whom Abbot Humez granted an indulgence. It was of the newer fashion, and for 200 years stood as part of the rebuilt church, but its plan and form were ruled by the old to which it joined on. The old Lady Chapel ended in a three-sided apse, the foundations of which have been found close to the great piers at the east end of the present chapel, which, leaving out the aisles and secondary chapels, agrees with it in plan. It is argued that the apse of the Confessor's church and the aisles round it, from which the Lady Chapel was entered, must have been near where the later ones are.

The rebuilding extended over twenty-four years, 1245–1269, according to Sir G. Scott. Mr. Micklethwaite is inclined to reduce the period, as the new chapter house was in use in 1253, and he considers that its four-light windows show an advance in style on the church, implying a rather later date. He believes that the north transept was the first part begun, and that the work there was kept well in advance on the south side, where the chapter house is.

Beginning with the north transept would cause less inconvenience to the daily life of the monks and in the use of the old church Mr. Micklethwaite considers that evidence is to be found of this in the triforium arcade, as all round the presbytery and the south transept the outer order of the arches varies in detail in a regular succession which had not been fixed when the north transept was built. Some of the caps also in the latter are carved, while all elsewhere in the triforium are moulded. Some special photographs illustrate this point. In 1261 the work up to that time was reckoned to have cost 29,345*l.* 19s. 8d. in the money of the time—equal to half a million now. We are given an interesting glimpse of how the funds were raised for church building in those days.

> "The enormous exactions by Henry III. have left their lasting traces on the English Constitution in the institution of the House of Commons, which rose into existence in consequence of the king's lavish expenditure on the Abbey."

Exactions from the Jews, from wealthy City burghers who would be barons, and the holding of compulsory fairs to the detriment of other markets, formed fruitful resources.

> "The new work was limited to the east of the already existing Lady Chapel, which was retained; the position of the transept was fixed in its place by the square of the cloister. The width of the main building was ruled by that of the Norman choir, to which the new work was joined on, and this with the cloister fixed the width of the aisles.
>
> Nevertheless the new building was larger in all possible directions than the old one. A ring of chapels was added round the east end. The transepts are longer and have aisles on both sides, the west on the south being carried over the cloister in a way which, I believe, is unique, because it might not cut into it. The new work rose above the old by, it would seem, the whole height of the clearstory.
>
> This work extended from the Lady Chapel on the east to the bay beyond the crossing on the west, thus covering the western aisles of the transepts. But the last bay was carried up only to the height of the old work; that is, that of the ground story and triforium of the new. The clearstory window on each side there has, as Sir G. Scott pointed out, the eastern jamb of this period and the western of the next. Temporary buttresses were no doubt put to support the great arches of the crossing until the clearstory was continued.
>
> Outside the church this work included the chapter house before mentioned, which was certainly built on a new site, the revestry, so much of the cloister as lay within the south transept, and its east wall to beyond the chapter house door.
>
> The next work was the rebuilding of that part of the western arm of the church which belongs to the choir, and one bay more in the ground story and triforium. The corresponding bays of the north walls of the cloister were rebuilt at the same time."

This portion has always been attributed to Edward I., but our author believes it is due to his father, and argues that, "while it was a distinct work, there was no interval." It shows only such slight alterations as might be made in the course of the work. "The plan of the pillars was improved, bronze bands were used to the shafts instead of marble, and a better treatment of the spandrels of the wall arcade was introduced, but the general feeling of the work is the same." It seems most likely that the first work was finished, or nearly so, in 1261, and that the choir as far west as the pulpit, or a little beyond, was built between that date and 1269, when the monks first sang the service in the new church on October 13. The nave was still of the twelfth century, one bay between being new up to the height of the old work, the clearstory jambs being left as before.

The story of the rebuilding of the nave is difficult to read, because, though it was spread over so many years, the design once laid down was kept to and the details not changed. "The design," says Mr. Micklethwaite, "is that of Henry III. work continued, and the details seem to me to belong rather to the fourteenth century than to the fifteenth. As early as 1342 we find a good deal of work going on in the nave. It is called 'new work in the old church,' and the account includes for whitewashing the walls." Mr. Micklethwaite thinks that at this time the intention was to modernise the old church, as at Norwich and Peterborough about this time, and he points out that most of the items seem to refer to windows. It is not, however, he says, until 1388 that we find any account for the pulling down of the old work. From that time the work seems to have gone on steadily but slowly all through the reign of Richard II. He is described as having erected a wooden porch to protect the delicate stonework of the north transept front, the entrances known as Solomon's Porch. "It was gorgeously decorated within, the walls covered with paintings, and three large pointed windows rose above its elaborate central door, beyond which the wooden porch projected 17 feet." This reads as a delightfully mediæval erection, such as Burges alone of modern mediævalists would have done justice to.

The nave was scarcely finished before the thirteenth-century Lady Chapel was pulled down to make way for the new Lady Chapel of Henry VII.—begun 1503 and finished 1519.

> "Meanwhile, changes had been going on in the other buildings of the Abbey which must have greatly altered the appearance of the place, owing to the provision of private apartments and even complete houses for individual monks. The work was chiefly of timber, and within this century much of it has been destroyed."

The work which was evidently addition to the stone buildings was, Mr. Micklethwaite believes, thought by most to be later than the Suppression in date, as indeed some of it was; but a good deal was older. There would be enough chambers to give his own apartment to every monk, for they were in the later years of the Abbey only about thirty in number.

It is significant that by some of these alterations the light was taken away from the older monks' parlour, from which it may be inferred that by that time the use of the parlour as the ante-room to the cloister, beyond which strangers who had business with any of the monks might not go, was no longer cared for, as

> "the common privacy of the cloister had given place to the individual privacy of each monk in his chamber or study."

Mr. Feasey gives us particulars of the subsequent history of the church.

In January, 1539-40, the Abbey was surrendered by Abbot Boston, who was made the first Dean, it being a cathedral until 1550. The revenue at that time was about 80,000*l.* of our money.

In 1556 it was refounded by Queen Mary, John de Feckenham being installed as abbot with thirteen monks. He restored the shrine of the Confessor, with the cornice and curious wooden top, which it still possesses. Three years later came the final Dissolution.

> "Although the early years of the sixteenth century saw the completion of the west front and central door, the two towers remained at about one half of their present height, without a gable to the front, until the time when the western façade was completed under the superintendence of Sir Christopher Wren, as may be seen in Hollar's views. Early in the eighteenth century Wren made drawings for the completion of the towers. His offer was accepted, and the work was brought to a conclusion about 1740."

In regard to the latter, Mr. Blomfield in his "History of the Renaissance in England," says that Hawksmoor succeeded Wren as Surveyor to the Abbey in 1723, so that probably no more than the successful general outlines of the towers is to be ascribed to Wren, and the grotesque detail must be due to the pupil. We could wish, however, that Wren's design for the central spire on the lantern at the crossing, which he began, had been given, as it is somewhat a rare print; also it would have been interesting to have had the question of the responsibility for the cutting back of the old masonry of the exterior of the church into curious semi-Gothic detail cleared up. It is part of the partial treatment of the book that Cottingham, to whose zeal Sir G. Scott pays a tribute, receives no mention, though his publication of Henry VII.'s Chapel is one of the most laborious, and, according to his light, thorough of architectural books. Blore, who is responsible for the pierced parapet of the Abbey, is also ignored, and while there is a reference to Sir G. Scott's "fostering care" we do not think he would have liked it to be said that he *rebuilt* the chapter house. In regard to the latter, Mr. Waterhouse, in an Academy lecture on the Abbey, drew attention to the scrupulous care of his restoration in this instance, as when he sacrificed his own design on the discovery of evidence of the old in the course of the work. As to the careful and artistic work of Mr. Pearson, it is referred to barely at all, and then also as rebuilding. We shall have to wait for his life, probably, to give us details, such as Scott's autobiography gives us, of his interesting and important work. The recovery by him of such a feature as the shaft respond of the flying buttresses at the east end, a feature common in France, is one well known point of his valuable work.

We have left ourselves no space in which to deal adequately with Mr. Bell's section on the monuments. It must suffice to say that a fine collection of the earlier monuments are given, one or two Elizabethan ones appearing more or less by chance, for, as we have already said, the scope of this section is too limited. Mr. Bell has drawn on Sir G. Scott and Burges for his clear and interesting notes on the varied monuments, commencing with the shrine of Edward the Confessor and ending with the tomb of Sir Francis Vere.

## NOTES.

Hellenic Society.

AT the meeting of the Hellenic Society on Thursday, the 25th ult, Professor Gardner read a very interesting paper on the subject of scenic painting in the Greek Theatre. Without entering into the arguments on the vexed question as to whether the principal actors in the Greek drama acted their parts on a stage or in the orchestra, he said that he should assume the theory that the raised stage had a real existence and was the place for the actors, and that there was a painted scene in the rear of the stage. References to scene-painting and scene-painters in Greek literature left no doubt that there was such an art, but it must not be supposed that it had any relation to the realistic representation of a scenic background, such as we are accustomed to see in the modern theatre. There was no evidence that the Greeks had any such feeling for the beauty or sentiment of natural scenery as exists in our own day. In art, at all events, the human interest was everything to them. In vase-paintings there was never any such thing as an attempt at the actual representation of a landscape or other surroundings of the figures; there were only symbolical indications; a column indicated a temple, a ragged line indicated a rocky ground, a series of waved lines was a symbol of the sea, and a single branch or spray of conventional foliage was taken to indicate a grove. The actual work of the scene-painter in the Greek theatre would probably be, in the first place, the representation of the architectural background. The back of the scene was always a building, with three doors by which the actors entered. Part of the business of the scene-painter would be to paint the columns and other details in a wooden erection into the semblance of a complete architectural screen. In addition to this, the *periakti*, or turning screens at each extremity of the stage, would probably be painted with symbols indicating the nature of the locality, such as we see on vases, and which would be accepted by the audience as sufficient indications of locality. A tower painted on the face of the *periaktos* might indicate a town, and if the action were changed to the seaside, a turn of the *periaktos* would reveal a dolphin or some other symbol of the sea as an indication of the change of scene. Further than this he did not believe that Greek scene-painting ever went.

### Romsey Abbey.

It is rather with regret than surprise that one hears that repairs are seriously needed to keep the grand Norman church of Romsey Abbey in a state of security. The most pressing matter is said to be the repair of the roofs of the South Chancel aisle and the South Chantrey, which were inefficiently restored two or three centuries ago, and are now in a very bad state. Nothing in the way of "restoration" in the usual sense of the word is contemplated—only such work as is necessary to keep the building in repair; but the construction of the new roof will enable the triforium arches on the south side of the chancel to be opened; and if it is possible to provide funds subsequently for repairing the roofs of the north and south aisles, this will facilitate also the opening of the triforinm arcading in the nave. The work is under the superintendence of Mr. Lewis Karslake, architect.

### York Minster.

The announcement that a sum of fifty thousand pounds is required for repair and restoration to York Minster, and among other things that the carved finials, pinnacles, and crockets which must be restored are "in number and delicacy overwhelming," sounds rather alarming, even though the work is to be under the conservative care of Mr. Bodley. If pinnacles and finials are in a dangerous state, and liable to come down, of course they must be renewed. But if there are cases where they are merely weatherworn and the carving wholly or partially obliterated, surely it would be better for the present to leave them as they are. The worn work is of more value than a new imitation.

### The Plasterers' Strike.

As will be seen from our report in another column, the meeting of the representatives of the Master Builders' Association and the National Association of Operative Plasterers, which took place on Tuesday last, has resulted in the adoption of an agreement on both sides which appears in itself to be satisfactory, if only the Plasterers' Association will abide by it. Their action in the past does not, unfortunately, lead one to have much faith in their promises for the future; and it may be observed that in undertaking to discontinue the boycotting and blacklisting of builders' firms against whom they had complaints, the plasterers refused to admit the accuracy of the allegations on the subject, the evidence for which is in fact absolutely irrefutable.

### Architectural Education for Women.

It is announced that at the Paris Ecole des Beaux-Arts it is intended to open, but not till next year, three special ateliers for women—for painting, sculpture, and architecture respectively. Up to the present time only one lady pupil has entered her name as an intending student in architecture, but it is expected that the opening of the new atelier will soon attract others.

### Railway Stations.

As we are now nearing the time of year when what is called the travelling public is moving about on the railways, it is desirable again to draw attention to the need of better indications at railway stations of the different offices, platforms, &c. Every office and platform should be indicated by large bold letters. If this were done the porters would be saved much time and trouble and travellers many inconveniences. On the Great Northern Railway the telegraph offices are now indicated clearly by large letters, and there is also much improvement in the way in which the names of the stations are shown. But, speaking generally, those in authority over English railways are singularly wanting in appreciation of the need of indications at railway stations, where the name of the station is often nearly lost amid a crowd of advertisements of a much more prominent character.

### India-rubber in Electric Cables.

A Paper by Mr. Terry in last week's *Electrican* calls attention to the decay of vulcanised rubber when used for insulating electric light mains. About ten years ago it was practically universally used, and electricians had very little misgiving about its enduring qualities. The age test, however, has told severely against its use in copper mains. The numerous failures of cables insulated with vulcanised rubber must be attributed to the deterioration of the rubber itself. Chemists have shown that the purer the india-rubber the longer its life. In addition, if the vulcanising process has been rapidly done, there is a large percentage of free sulphur in the product, which, in the presence of copper, accelerates the decay. Engineers usually talk as if the tinning of the copper wire were done in order to prevent the wire being eaten away by chemical or electrolytic actions. Manufacturers, on the other hand, recognise it as useful in protecting the rubber from the action of the copper, and thus increasing its life. Samples of decayed rubber taken from electric light mains often show traces of salts of copper, and there is no doubt that this has hastened the decay. The exact chemical action that takes place is obscure but whenever copper is present decay has begun. The symptoms of decay are familiar to all who have to do with electric light or bell wires. The rubber becomes hard and brittle and loses its elasticity. In the final stage of the oxidation it can even be ground into a powder with a pestle and mortar. Of course there are other agencies besides copper which accelerate its decay—heat, grease, light and air, and the sulphuric acid formed by the action of the latter on the free sulphur in the rubber. No wonder that many engineers prefer cables insulated with such chemically inert substances as asphaltum or paper.

### The Grafton Gallery.

The exhibition at the Grafton Gallery, held under the auspices of *L'Art Nouveau*, consists mainly of glass by Mr. Louis C. Tiffany and bronzes by M. Meunier. The Tiffany exhibition includes some very interesting specimens of stained glass; one in imitation or emulation of a Chartres window of the twelfth century, is noteworthy for its rich jewelled effect. Some of the windows exhibited are, however, far too pictorial in style. The collection of coloured and irridescent glass ware is a very fine one, and well worth attention; among objects of special interest to architects may be mentioned the electric hanging lamp for a library table, in metal and leaded glass (in one of the small rooms or lobbies opening out of the large gallery). The case of jewellery designed for *L'Art Nouveau* M. E. Colonna, in the centre of the large room, is clever but unfortunately too clever—the French artists do not seem to be able, in this class of art, to get rid of the element of *chic* which so vulgarises many things made in Paris, and the forms look as if eccentricity, rather than beauty and simplicity, was the aim of the designer. The most important element in the exhibition is to be found in the collection of bronze sculpture of figures in rustic or artisan life, by M. Meunier, who may be said to be a kind of Millet translated into bronze. The figures, mostly to a small scale, are characterised by great truthfulness and force in the delineation of workers of different orders, in the dresses and attitudes proper to their craft. There is little beauty in Meunier's work, as beauty is ordinarily understood, but there is sincerity and power of modelling and expression which give it a high interest. In our opinion the artistic value of this class of realistic work is over-estimated at present; there is a kind of run on peasant and artisan subjects just now—a re-action in art—which will not be permanent, and which by some artists is taken up as a mere fashion; but there can be no doubt, at all events, of M. Meunier's sincerity, which shows itself throughout his work.

### The Knightsbridge Exhibition.

The Exhibition of the "International Society of Sculptors, Painters, and Gravers" (there is nothing like a high-sounding title) at the Knightsbridge Gallery may be characterised as a collection of large sketches and studies for pictures (some of them painted in dirt rather than in colour), relieved on the one hand by a few works of really fine character, and on the other hand by absurdities and caricatures for which the only appropriate criticism is the insertion of a "!!!" in the margin of one's catalogue. Among the principal redeeming points are some of the portraits. Mr. R. Brough's "Miss Ogston" (47), somewhat tame in colour, has a fine spirit and movement about it, and Mr. Lavery's "A Lady in Pink" (90), though very sketchy (we fancy a finished painting would not be admitted), has real distinction in style and expression. There is character and originality in Mr. Alexander Mann's "Portrait of a Lady" (104) leaning back in her chair with a fashion-plate magazine in her hand; character too in Mr. Guthrie's "Mrs. Edward Martin" (98). Mr. E. A. Walton's life-size sketch, "The Sun-dial" (57), has the makings of a fine picture, both in colour and design. Among landscapes, a very clever one with considerable originality of style is "Calma Crepuscolare" (227) by an Italian artist, Signor Fragiacomo (*quasi* "Fra Giacomo": it looks like a coined name). The best of the other landscapes are among the smaller ones, such as Mr. Padgett's "Evening in Holland" (185), Herr Zügel's "Sunlight" (207*a*), which justifies its title; a good architectural picture of the Cá d'Oro, by Mr. W. P. Whyte, and an interior sketch on a large scale by Mr. H. Wilson, in his usual style. There is also a landscape by Mr. H. W. B. Davis, who looks out of place in such a collection, nor is this a work of his best. Among the small collection of sculpture are works bearing good names, but not realising much—in fact, like the pictures, they seem mostly sketches or studies; M. Dillen's nude kneeling figure, "La Mélancolie," is an exception. A special room entitled "the white room," is set apart for the hanging, in the middle of an expanse of blank wall of a few scrawly etchings by Mr. Whistler (the President of the Society), too precious to be mixed with the profaner works.

Drawings of the Riviera.

A COLLECTION of water-colour drawings "Illustrating a Season on the Riviera," by Mr. Arthur Burrington, is on view at the Gallery of the Fine Art Society. These are mostly free and slight sketches aiming at giving impressions of light and colour. Some of these are very bright and effective; among the best are "Lemon Gatherers" (14), "Under the Olives" (6), and "Spring" (22). There are some clever studies, too, of the fashionable crowd of Monte Carlo—"Café de Paris" and "On the Terrace" for instance (17 and 18), and a higher note is touched in "Daydreams—an Idyll" (49), where a young girl stands on the balustraded terrace, her back turned to the spectator, amid a brightly-lit mass of vegetation with the blue of the calm sea for a background. The largest work in the collection, "It Rains" (33) is an interior of a cottage with a figure at the window, in quite a different manner from those already mentioned; an interesting work somewhat recalling the feeling of Israels in a similar class of subject. A very interesting drawing also is that entitled "École Communale" (64), a clever and characteristic study of a file of peasant children entering the school.

A Repoussé Silver Exhibition.

AT the Fine Art Society's Gallery there is also a small collection of works in beaten and repoussé silver, by Mr. Gilbert Marks, with a preface to the catalogue by Mr. Spielmann. These prefaces seem to be inserted to tell the spectators what to think of the works, visitors being supposed to be unable to form their own conclusions. As we are not among those who are ready to submit to this kind of guidance, we may say that both artist and preface-writer have failed to appreciate the real requirements of decorative silver work as applied to objects for use. Mr. Marks's treatment of repoussé work is bold and free, and shows the hand of an accomplished craftsman, but his use of flower forms is far too realistic, and too ragged in line. This is especially noticeable in the treatment, for instance, of the feet or supports in the large bowl, No. 49, which are formed of twisted naturalistic stalks and leaves, bent round and resting on the bend formed by twisting them back; anything weaker in the way of a structural support could not be imagined. This is handiwork, but it is not *design*, which is quite a different matter. The supports in No. 51 are a little better, but still very deficient in structural and conventional quality. The small dessert stands (23, 24, 25) are in much better artistic style, but they are not among the most important exhibits. The wrought steel box inlaid with silver (43) is a good piece of work. But in general the collection shows a want of feeling for the element of design, and is far too imitative in the character of the ornamental work.

The Crystal Palace.

THE Crystal Palace prospectus for the summer season includes the promise of a new picturesque attraction, the electric light illumination of the fountains, which ought to have a fine effect. The work has been put into the hands of Mr. F. W. Darlington, electrical engineer, of Philadelphia, who carried out the instalment for the electric illumination of the fountains in Prospect Park, Brooklyn, U.S.A. It is also announced that arrangements have been made for the illumination of the terraces on the garden front of the Palace. The usual fine firework displays of Thursday evenings will, of course, be continued. There are various other attractions which it does not come within our province to notice; but we may call the attention of our numerous readers who are interested in music to the performance of Mendelssohn's "Elijah" on a great scale, on the Handel orchestra, which is announced for June 24. This oratorio seems to be generally selected for these *interim* performances on the Handel orchestra, on account we presume of its general popularity, which renders it the best "draw" in a financial sense. We may suggest, however, that when the opportunity again comes round, it would be a very interesting and probably not an unsuccessful experiment, to try one of Bach's two greatest works, the B minor Mass or the "Passion," on the same scale.

◆

MEMORIAL TO FAMOUS WELSHMEN.—On the 23rd ult. Mrs. Herbert Roberts unveiled a memorial erected in the village of Llansaunan to immortalise the work and memory of five famous Welshmen, natives of the parish—viz., Tudor Aled Vaughan, 1470, a Franciscan monk of poetical renown; William Salesbury, born 1515, the translator of the New Testament into the Welsh language; Henry Rees, born 1797, the most eloquent preacher in the Welsh Calvinistic Methodist denomination; William Rees, his brother, politician and litterateur; and Edward Roberts, born 1819, a Methodist minister and writer of Welsh poetry. The memorial, which takes the form of a bronze figure of a little girl, attired in Welsh costume, seated at the foot of a granite column, and in the act of weaving a garland, is the design and work of Mr. W. Goscombe John, A.R.A.

## THE ROYAL INSTITUTE OF BRITISH ARCHITECTS:

### THE PLANNING AND CONSTRUCTION OF BOARD SCHOOLS.

A MEETING of the Royal Institute of British Architects was held on Monday at No. 9, Conduit-street, Regent-street, Professor Geo. Aitchison, R.A., in the chair. The meeting was made special for the suspension of regulations under By-laws 3 and 7, so as to allow of the nomination as a Fellow of Mr. George Frederick Bodley, A.R.A., Royal Gold Medallist elect. The suspension of the by-laws was unanimously agreed to.

Mr. W. J. Locke, Secretary, announced, with regret, the decease of Mr. Charles Bell, elected Associate 1870, Fellow 1880.

Mr. T. J. Bailey, Architect to the London School Board, then read a paper entitled, "Planning and Construction of Board Schools."

Dealing first with the public elementary school, the author dwelt upon the need for careful selection of the site. An ideal site would be one of about two acres, rectangular, with the longest side as a street frontage, and having a western aspect streetwards. There should be proper provision of light and air, immunity from noise of traffic for class-rooms, an open playground space of at least 30 superficial feet for each child, and of such a shape as to be available for games such as football for the boys, tennis, &c., for the girls. In London and crowded districts, where the ideal 30-ft. minimum cannot be realised, the playground question is usually best solved by providing on the ground level for boys and infants, and putting a flat over the whole top of the building to form a playground for the girls. Where sufficiently large, playgrounds should have a covered space, 50 ft. or 60 ft. by 18 ft., with sides enclosed, open in front to the sun. Various desirable accessories to playgrounds, the most suitable paving, walls, and railings, gates, the schoolkeeper's lodge, &c., were duly detailed by the author.

Next, treating of the buildings, the author described the three-story school, as being the most usual type. The infants are on the ground floor, the girls on the first floor, the boys above. The maximum size or accommodation of a group should not exceed 1,548—in departments of boys 516, girls 516, infants 516—and if further accommodation is required, it should be provided by a separate mixed department. The hall, considered by the Board indispensable to every department, is a very good size at 54 ft. by 30 ft.; the class-rooms, ten in number to each department, graduate from sixty to forty in accommodation. If possible the main line of class-rooms should face the playgrounds rather than a noisy road, and draw their light from the east, as that aspect suns up the rooms in the early morning and does not disturb them for the day. The hall, facing west, provides a good reservoir of sun-lighted air to help the class-rooms, and is a cheerful place to march the classes into for recreative or collective purposes. Architecturally, this elevation, being the more broken up (comprising the main lighting of the hall, the staircases, cloak, and teachers' room and blocks, and gable ends of wings), is more desirable for a street front than the long unbroken line of class-rooms. Two staircases for each senior department are required, and two entrances for the infants on the ground floor. The author then described in detail the plan of the building, the dimensions of the various rooms and staircases, the fittest materials for facing walls and for floors and staircases, the requisite fittings, and the lavatory and sanitary arrangements.

Touching warming and ventilation, the author glanced at the efforts towards improvement in these matters during the last twenty years. He commended as very good the system of low-pressure hot-water pipes round the walls and just above the floor, where the desks are placed, and a few ventilating radiators bringing in warm, fresh air; but, even with this system, an open fire in the room is needed, the brick flue simply connecting with the outer air not being sufficient for extraction. The author had tried trunks from the ceiling line of each room gathered into groups, with a single outlet equal to the combined area of the group, and with a coil of hot pipes in the same to produce an upcast. This was effectual as far as ventilation was concerned, but could not be recommended for schools of more than one story in height; in three-story buildings it had the effect of conveying the sound from the rooms below to those above, and disturbing the classes. The greatest care should be taken to get continued purity of air, and with as little trouble as possible. The system known as the "Plenum" effected this in the only satisfactory way; it introduced fresh filtered air above the heads of the occupants of the room, warm in winter and cool in summer, diffused it over the area, and extracted it at the floor level on the same side as the inlet, carrying away with it all the unpleasant odours of damp and evil-smelling garments. This system has the further advantage that where closed and even double windows are necessary to exclude noise, there is always a quiet side from which the supply of air can be drawn, and the closed and double windows improve the working. The cost is not appreciably more than an ordinary hot-water installation, but the builder's work involved in the formation of ducts, flues, &c., is a rather costly item.

In a section on furniture and fittings, the author dealt with the pattern of desks, and their arrangement in the various departments, the lighting, the seating accommodation, platforms, cupboards, and the adjuncts found essential for educational and recreative purposes. Interesting reference was made to an order issued by the Board to each of their schools, requiring a plan of the departments to be prepared by the scholars under direction of the teacher, measured and drawn to a scale of 4 ft. to the inch, the furniture delineated, and the walls coloured in, and submitted to the architect for approval before being framed and hung up in the school. Some two or three hundred of these plans had been submitted to the author, and he had been much surprised and pleased at the high quality of the work. Few had been returned for revision, and some would have been no discredit to an architect's office.

The higher grade schools, of which there are forty-four in operation under the London School Board, are equipped with rooms for science teaching in addition to those for art and manual work. They comprise chemical and physical laboratories, with balance room and small dark room for experiments in photography, and a store for chemicals; also a demonstration and lecture room. The buildings, fittings, and general arrangements of the Cassland-road School, Hackney—a typical example of the higher grade school—were shown in a series of detail drawings exhibited by the lecturer.

A third division of the paper was devoted to buildings for special instruction, comprising centres for domestic economy (cookery, laundry work, and housewifery), manual training in wood, manual training in metal-work, swimming. The combination of subjects in the domestic economy curriculum has led to the requirement of a building in each case capable of giving proper facilities for the teaching. A typical building, planned after consultation with the committee in charge of these subjects and the lady superintendent, consisted of a class-room on the ground floor, 22 ft. by 18 ft., seated for forty girls, a kitchen, sitting-room, scullery, and bedroom, with entrance-lobby and staircase leading to the laundry and cookery class-rooms on the upper floor, the object being to provide instruction in general housework, as well as cookery and laundry work. Details were given of the requirements of the Manual Training Centre for wood and metal work. With the sanction of the Education Department the Board have decided to establish three swimming baths in connexion with the schools at Marlborough-street, Southwark, Hugh Myddelton, Finsbury, and Lyham-road, Brixton. Particulars were given of the proposed bath at Lyham-road. The building will be separate from the school, and have a distinct and separate entrance, with superintendent's office, &c. The swimming pool will be 50 ft. by 20 ft., 2 ft. 9 in. deep at one end, and 5 ft. 6 in. at the other, lined with white glazed bricks, and having dressing-boxes, spray baths, water closets, &c., and washing and drying-room for towels and bathing dresses. The water will be warmed by the injection of steam round the sides close to the bottom of the bath, the pipes being in chases and cased for protection.

The mixing of children mentally weak with those of normal intellect being productive of undesirable effects on both, it has been found necessary to provide accommodation for these in specially planned buildings. There are thirty-nine centres in actual work in London, with 1,597 children on the rolls (October 31, 1898), and about thirty-five more are either in course of building or immediately contemplated. The unit for class-room is less than that for the ordinary school, more individual attention being required. The class-rooms are all on the ground floor, are 20 ft. square, and seated for twenty children. A hall corridor about 20 ft. wide, well warmed, and made as cheerful as possible, is provided for exercise, drill, &c. A good lavatory and baths are provided. Boys and girls are frequently taught in mixed classes, but have separate playgrounds and offices. Schools for the deaf are also provided on the centre system, and are much on the same plan as those for the mentally defective. The class-rooms are smaller, 18 ft. square, and seated for ten. Seats should be arranged in a circle, and the rooms should have a strong high or top light so that the lips of the children can be watched and studied, they being taught to read what is said by the lip movement. The Board have seventeen centres in operation, with 513 children on the rolls (October 31, 1898), and seven in course of provision. Particulars were given by the author of a scheme for the establishment by the School Board of a home for the boarding and instruction of deaf children who had to be taught on the sign system. The schools will be built on the cottage home principle, the number in each home not to exceed ten, and the training will be largely agricultural or horticultural. In most divisions of the London district, school accommodation has to be provided for a few blind children. These number about 150, distributed over eight centres, and it is generally sufficient to provide two small class-rooms at each centre, with separate entrances, cloak-rooms, and lavatories, the classes being mixed. Separate play-yards and closets are necessary.

Under the head of buildings for the training of teachers the author described a scheme of buildings for this purpose which might be considered as very complete, and as embodying all that is likely to be required in the future. On the ground floor are provided four class-rooms for forty-two and thirty-six, two of each, seated with single desks, a central hall, 50 ft. 6 in. by 33 ft. 6 in., with staircases, &c., at each end. On the first floor are four class-rooms and a properly equipped gymnasium over the hall; on the upper floor an art room over the gymnasium, the remainder of the floor being devoted to chemical and physical laboratories, lecture-room, balance and dark rooms. A basement is provided for the engineering apparatus, and also a kitchen for the preparation of luncheons. The site of the particular buildings dealt with was large enough to give space for lawn tennis on the girls' side and for football on the boys'.

The buildings for industrial and truant schools, which next came under consideration, must be of an essentially different character from other buildings of the Board, as they are boarding establishments. Descriptions were given of a building recently erected for this purpose in connexion with the Shaftesbury Training Ship, and also of the Upton House Truant School, the only building as yet erected specially for the purpose. The Board are negotiating for a large site of some fifteen acres in the neighbourhood of London, for the purpose of erecting two establishments—an industrial school for about 120 boys, and a truant school for a like number. The two institutions will be entirely separate as far as their occupation and management are concerned, but will probably be under the control of one superintendent and body of managers. Details of the proposed plan and general arrangements of the buildings were given by the author.

For the purposes of the administrative work of the Board, London is divided into eleven divisions, necessitating a corresponding number of office buildings. The offices for the East Lambeth Division, now erecting in the Peckham-road, were selected for description as a typical block. On the ground floor is the entrance hall, a large room 57 ft. by 22 ft., for the visitors to perform their clerical work; a room for the assistant superintendent, and an office for the check clerk, also the lavatories, water closets, &c.; on the first floor a committee-room, used also by the superintendent, and a clerk's office; on the second floor the correspondents' and clerks' offices, and caretaker above.

In a few general remarks with which the paper closed, the subject of cost was dealt with. The Princess May School, Kingsland was cited as a typical case, and as tenders were received only so lately as March of the present year, it may be considered as up to date. The building is to be of three stories, to accommodate 1,548 children on a site of about 1¼ acre. The cost per head is estimated to be 13*l.* 18s. 4d. This includes building the whole of the brickwork in cement, also the provision of glazed bricks to staircases, corridors, and dadoes of class-rooms and halls, but does not include furniture. The cost of enclosing the whole site with walls and railings, tar-paving, drainage, and provision for deep foundations below a normal depth of 6 ft. is about 5,000*l.* more. The total cost will be some 750*l.* within the limit allowed by the Education Department. There was a suggestion a few years back that unnecessary expenditure was incurred on architectural adornment, and the committee dealing with this branch of the work ordered two or three schools to be built of stock bricks and slate roofs, with no architectural features about them. It was found, however, that the difference of cost between bare utilitarianism and buildings designed in some sort of style and regard for materials and colour was rather less than 5 per cent.

---

Mr. Locke read the following letter by the Chairman of the London School Board:—

"SIR,—I much regret that I cannot attend the meeting on May 29, as I am going abroad. Mr. Bailey's paper is of great interest to architects and educationalists, and deserves to be widely read and translated into foreign languages, as it is sure to attract the attention of foreign educationalists. Mr. Bailey speaks with authority. The building operations of the London School Board are on such a large scale; the problems which have to be solved are so varied; they have been so carefully considered by a number of experts, that Mr. Bailey's admirable review of this branch of the School Board's work cannot fail to meet with the full recognition due to the care with which it has been written.—Your obedient servant,

REAY."

The Hon. E. Lyulph Stanley (Vice-Chairman of the London School Board) said that to build a public elementary school was a matter which could not be approached simply by architectural skill and knowledge, because the conditions were very special. The architect had to follow the policy of the particular School Board or other managers of schools who employed him. An architect, thoroughly to know what a school ought to be, should be familiar with what had to be done in a school. Although Mr. Bailey had laid down a great many propositions as to what was best and most desirable, at the same time, in some things, his idea of what was best must have been limited by the parsimony of his employers. For instance, in describing what a class-room should be, he mentioned that he would put glazed bricks as high as the dado, and then above that he would have the wall of a special type of brick. Now, a provincial School Board, say Liverpool or Birmingham, would probably demand that the walls should be thoroughly finished with plaster, not left in the rough brick; therefore he did not think, because Mr. Bailey, working for very economical, not to say parsimonious, employers, had indicated certain roughness and want of finish in the building, that that really indicated the type of building an architect free to advise his employer would consider was the proper way of finishing his building. He agreed with Mr. Bailey that the furthest scholars ought not to be more than 20 ft. or 22 ft. from the windows, getting their light from the left; but Mr. Bailey had not mentioned in how many of these matters the School Board for London had had to carry these educational points almost by force against the Education Department. Only quite recently the Board had been invited to make their furthest row of seats some 24 ft. from the light. With regard to the use of halls in dealing with the discipline and education of children, that was a school-manager's question, not an architect's. There was not the slightest doubt that, if a room was to be used for one purpose, it had better be constructed for that purpose; they should not attempt to make it answer some other purpose. In the interest, however, of supposed economy the Department sometimes suggested that they should put a class in the hall. It would be apparent to architects how bad it was to have a class in a room some 50 ft. by 30 ft., which was used as a passage for children going to and from the various class-rooms. Apart from that, it put a great strain upon the voice of the teacher. Architects, in considering a school plan, should concentrate their attention first and foremost upon the arrangement of the class-rooms. There were many disputed questions in school planning. Mr. Bailey spoke about the stepping of the floors, but experts were not at all agreed as to whether the floors of the class-rooms should be stepped or not, and whether the platform from which the teacher delivered instruction should not be raised and the floor flat. On the Continent, where people were supposed to have paid a great deal more attention to school planning than in England, the rule was against stepping a floor. These things could not be treated as questions absolutely decided ; but such questions as the size of a class-room and the cubic content depended very much upon the rapidity with which the air could be changed. There was not the slightest doubt that for the facility of a class seeing the black-board, and for the diminution of the strain upon the teacher's voice, and for lighting the room quite to the back from the windows, it was not desirable to make the class-room a bit larger than was absolutely necessary for the health of the children. Teaching was much more pleasantly conducted in a moderate-sized room than in a large one ; but they must have air. Mr. Bailey, he thought, had not fully brought out the importance of varying the size of the class-rooms. The work of teaching in the more advanced classes made smaller class-rooms necessary for the higher divisions, in order to lessen the strain on the teacher. There had been days when the Education Department recognised in its Code a class of eighty, and in those days an economical School Board built class-rooms for eighty. One result of planning schools in that way in the earlier days was that, now that people had a higher idea of what was due to the teaching of children, a certain amount of space was wasted. Fifty children, for instance, were put into a class-room originally planned for sixty, with the result that ten places had to be written off and were unavailable. But coming back to his former proposition : it was policy that determined plan, and it was not the architect who determined the policy ; it was the Education Department, or the particular Board who employed him, and the public opinion of the country. Still, if architects made themselves familiar with the requirements of school planning, they could make recommendations to the Board when they were called in, and their influence might do something to educate the Board who employed them.

Mr. C. J. Dawson (head-master of the Aldenham-street School, St. Pancras) said that in the building he was constantly engaged in there was one large room that accommodated over eighty scholars, according to the dimensions laid down in the Code, and it was only separated from another room by a sliding partition ; the other room accommodating sixty ; so that it was practically a large room for 140, separated by a sliding partition. Two other rooms at each end of the building were also separated by slight walls and partly sliding partitions, and those accommodated rather over forty each. If they were taken together they were very inconvenient and too large for a teacher properly to manage, and if they were taken separately the classes were smaller than the Board and the Education Department required to be placed under the control of a single teacher. The question of ventilating and warming was a combined question, because if scientfic principles could be thoroughly applied, there should be a system possible by which the warming should help the ventilation and the ventilation assist the warming, in one way, by supplying cool air in the summer time and warmer air in the winter, If the system referred to by Mr. Bailey fulfilled all that was claimed for it, it ought to be put into operation in every school where it was possible, and, at all events, in every new school, unless the cost was so large as to be utterly prohibitive. But in many schools he was acquainted with the ventilation was an entire failure by the system provided. He thought Mr. Stanley had given the main points with regard to the size of the rooms, the arrangement of the light—which should come from the left-hand side—that no one should be seated too far from the light, and that there should be no dark corners. That was a very important point, both for the sake of the teacher and the scholar, and on the ground of discipline. In his own school there were corners where the light from the windows did not reach at all, and the children could not see properly there, so that a part of the room was wasted, which could have been utilised if the light had been better distributed. With regard to the size of the rooms, Mr. Stanley had called attention to a very important point, namely, that the rooms should not be larger than was absolutely necessary for the health of the children and to permit of sufficient air space. That was an important consideration also from the point of view of the teacher's voice. Nothing had been said about the acoustic properties of rooms where teaching had to go on. Sometimes the rooms in a school were not at all well adapted for sound. He did not understand the principles of construction which would make the sound more effective, but before he came under the London School Board he had had to manage the whole of a school in a large room, over 60 ft. by 30 ft., and fully 20 ft. high. Several classes were taught in that one large room, and the echoes were so confusing that it was a very great strain upon the teachers' voices, and yet they had a difficulty in making themselves heard distinctly by the scholars. The time of those large rooms seemed to have passed, and the class-room system was now generally adopted in the newer schools. This matter of acoustics certainly affected the question referred to by Mr. Stanley as to classes being held in school halls. In such cases the voice of the teacher was carried round and up by the celling, and was lost to the scholars, and raising the voice very often made matters worse. It was very difficult to pitch the voice so as not to produce confusing echoes in a room of that sort, and the fact that the class only occupied one-fourth of the room made it worse. If the room were full it would be less difficult to make the voice heard all over it than if only a small portion of it were occupied and the rest empty.

Mr. E. W. Mountford proposed a vote of thanks to Mr. Bailey for his very useful paper. They heard of these hundreds of schools being built in the last few years, and of the large number that were coming on, and for Mr. Bailey's own welfare it seemed advisable that some of the work might be given to other architects. What had interested him most was the reference to the warming and ventilation of the buildings. Only five or six years ago some plans of his had to go before the late Mr. Ewan Christian, acting on behalf of the Charity Commissioners, and he, with the later buildings of the Board before his eyes, absolutely refused to allow any kind of mechanical ventilation to be put into the building. Mr. Christian said he had recently examined, at the request of the Board, some of the London schools, and had come to the conclusion that there was nothing in the way of ventilation to equal windows. Windows that went up to the ceiling and opened at the top provided absolutely the best ventilation that could be got. Acting on his command, he (the speaker) had to cut out his system of ventilation, and he had been more or less abused for several years past in consequence. The "Plenum" system, which Mr. Bailey seemed to favour, was probably the best system ; but he should like to hear his opinion of that system in, say, ten years time. Only quite recently several members of the Institute Council were taking over a large building in Birmingham which had recently been fitted up with this system, and he had been struck with the considerable accumulation of very black dust in the ducts through which the warmed air was forced into the various wards. Now, that dust represented simply the thicker and heavier particles which the fans had not been able to force into the wards, and it seemed to him an absolute certainty that a great deal of dust had been forced into the wards and swallowed by the patients. In a new building there was not much objection to that, possibly, but as time went on and the soot accumulated, and more and more was forced into the lungs of the patients, it would become a very big question whether the "Plenum" system would not be taken out of those buildings and something of a different nature put in. It was said of the "Plenum" system that it was equally available in summer for forcing in cool air. That, he thought, was a great mistake. People did not mind having air forced into a room so long as that air was very warm, but when they began to force in cold air the inevitable result would be that the occupants of the room would block up the openings.

Mr. R. Phené Spiers seconded the vote of thanks. He had built two of the first Board schools, and he could see now that they were built entirely wrong, but they were built according to the policy of the Board at that time.

The vote of thanks having been agreed to,

Mr. Bailey, in responding, said he was glad his paper was considered a useful one. He had tried to make it as comprehensive as he could, as he thought it right that the Institute should be acquainted with the details of the extensive work the School Board were carrying out.

The Chairman said that it might be safely considered that if children were put into rough, uncultivated, unattractive places they could not be expected to gain that admiration for beauty of form and colour which was so necessary to human happiness, and also for that which so largely affected the bulk of the people, viz., progress in trade. He was of opinion that the walls of their schools should be covered with some beautiful tiles or enamelled bricks, that the best art that England could supply should be constantly before the children when their attention was not engaged in their lessons, and that everything should be as simple as possible, but with a certain amount of grace, so that their faculties might be cultivated to admire the beauties of Nature which they saw around them. He had had some small experience in that kind of thing, and he found that even those students who were specially devoted to form and colour had a remarkably small observation for the objects of Nature by which they were surrounded. —the simple shells, the simple flowers, the simple leaves. If that was the case with people who were trained to study, how much more so was it with those whose artistic faculties were left dormant, and were surrounded with quasi-ugliness ? He hoped the gentlemen more particularly interested in the work of the Board would give a thought to the subject he had mentioned.

The meeting then terminated.

## THE SURVEYORS' INSTITUTION :

### ANNUAL MEETING.

THE annual general meeting of the Surveyors' Institution was held on Monday afternoon in the new premises, 12, Great George-street. Westminster, Mr. Robert Vigers, President, in the chair.

The first business was the reading of the Scrutineers' report on the election of Council for 1899-1900. Mr. T. M. Rickman has been elected President. The new Vice-Presidents are :—Mr. A. Vernon, High Wycombe, and Mr. H. Drew, Exeter ; and the new members of Council are Messrs. Leslie R. Vigers, Thomas Blashill, and, as Professional Associate of Council, A. Norman Garrard.

The Secretary, Mr. Julian C. Rogers, then read the thirty-first annual report of the Council. We take the following extracts from the report :—

The total number of all classes on the roll on May 1, 1899, is shown in the following table, which also gives the numbers at the corresponding date in May, 1898 :—

| | May, 1899. | May, 1898. |
|---|---|---|
| Honorary members ...... | 16 | 17 |
| Fellows .................... | 1,887 | 1,835 |
| Professional Associates | 686 | 615 |
| Associates .................. | 84 | 85 |
| Students ..................... | 308 | 272 |
| Colonial Fellows ......... | 12 | 12 |
| Total ................. | 2,993 | 2,836 |

The difference in the number of Fellows is due to the election, under the dispensing power, of fifty-six candidates for that class, and the transfer of thirty Professional Associates who have passed the Qualifying Fellowship Examination, deducting those who have died or ceased to be members. The increase in the class of Professional Associates is accounted for by 116 elections, as against thirty transfers and fifteen losses by death and cessor of membership. The number of students was increased by thirty-six, allowing for those whose studentship expired by effluxion of time, or who, having passed the examination in Division II., became Professional Associates.

The Council have to record, with deep regret, the death of their late President, Mr. Christopher Oakley, who occupied for many years a leading position in the profession and who rendered signal services to the Institution ; of Mr. Thomas Scarth, an eminent land agent and surveyor in the north of England, who served on the Council for some years; of Mr. W. C. Little, of Stag's Holt, a well-known authority on the economics of agriculture; of Mr. Bovill Smith, Mr. George Beaumont, and Mr. George Brown, of Barnstaple, who were among the oldest and most respected members, and of Sir John Fowler, the distinguished engineer, who had been an Associate of the Institution from its earliest days. . . .

The "Institution" Prize of the value of fifteen guineas was gained by a candidate in the "Building" Sub-Division of Division II., who obtained 860 marks out of a possible 1,000. The "Special" Prize of the value of ten guineas was awarded to a candidate in the "Building" Sub-Division, who obtained 788 marks out of 1,000. The "Crawter" Prize, for the best work in the subject of "Valuations" in the Division IV. Examination, was awarded to a candidate in the "Land Agency" Sub-Division, who obtained full marks in the subject. The "Penfold" Gold Medal was awarded to the candidate who obtained the highest marks in Division IV., viz: 855 out of a maximum of 1,050. The "Penfold" Silver Medal was gained by a "Building" candidate in Division III., who also won the "Driver" Prize of the value of 15*l.*, with a total of 1,044 out of 1,200 possible marks. The "Preliminary" Prize was awarded to the candidate heading the list in the Preliminary Examination, with an aggregate of 492 out of 500 marks. The "Daniel Watney" Forestry Prize has not been awarded this year, there being no candidate whose work was of sufficient merit to justify its award. . . .

Again, for the tenth year in succession, the Council have to thank the Right Hon. the Earl of Jersey for placing a large portion of his park at Osterley at the disposal of the Institution for the purposes of the "Surveying and Levelling" and "Timber Measuring" "Outdoor Examinations," and for the hospitality which, on the days of those examinations, he extended to examiners and candidates alike. They desire also to express their obligations to Mr. W. D. Little, his lordship's agent, for his kind and considerate arrangements. . . .

There has been a large increase in the Scottish committee since the date of the last report. It now numbers eighty-three members, thirty-seven having been elected under the dispensing power, on the condition that, after Christmas, 1898, no members should be elected in Scotland (subject to the special provisions of the by-laws) without previously passing the qualifying examination, the nature and scope of which has been agreed to. It is hoped that the result will be as satisfactory as regards the professional status of members in Scotland as it has proved to be in England. . .

The Council cannot allow the retirement of Mr. R. G. Clutton and Mr. Edward Smyth from their body to pass without an expression of their deep regret at the severance of their long and honourable connexion with the governing body of the Institution—the one on grounds of health and the other by reason of advancing years. To Mr. Clutton and the great firm which he represents, the Institution owes a great debt of gratitude. Mr. Smyth, who has been a representative of the class of Professional Associates for thirteen years, has been a most devoted friend of the Institution, and has rendered it services in that capacity, and as one of the honorary examiners, the value of which it would be difficult to exaggerate.

The Institution is at last in occupation of its new and permanent home, after many vexatious delays, some of them due to the present disturbed condition of the labour market. The rehousing of the Institution has engaged the anxious and almost unremitting attention of the Council for the last five years. Early in 1894, on the failure of the promoters of the Westminster Improvement Bill to carry out the scheme under which they had agreed to allot to the Institution an advantageous site on the north side of Great George-street, it was referred to the Building Committee to consider, and report on the terms for acquiring a sufficient area of the surrounding property for the extension of the Institution premises on the existing site. It is not necessary to follow the course of the rather difficult and complicated negotiations which ensued; it is sufficient to state that as a final result it was decided to acquire three additional houses, viz., 13, Great George-street, and 3 and 4, Little George-street, which, with the site of the then existing premises, afforded a building area of 6,700 square feet. For this area the Ecclesiastical Commissioners finally agreed to a ground rent of 1,000*l.* per annum, on a lease for 999 years, in place of the 1,070*l.* which the property was previously yielding, the Institution undertaking to put up a new and substantial building as security for this rent. . . .

With the close of this session the thirty-first volume of the *Transactions* of the Institution is completed. It may be of some interest to mention that this series of thirty-one volumes is made up of 400 parts comprising 250 papers with the discussions upon them, and thirty-one annual reports of the Council, the whole amounting to some 15,200 pages of matter. . . . The last volume deals with subjects so diverse as, "The London Building Act," "The Management and Valuation of Brickfields," "The Working of the Light Railways Act," "The Valuation and Rating of Tithe Rent-charge," "Railway Rates," and "The Recent Proposals to enable Working Men to Purchase their Dwellings by Means of Loans from Local Authorities."

The last issue of the *Professional Notes* contains a Scottish supplement, intended as the vehicle for the publication of professional information of special interest to the members north of the Tweed, and the Council confidently count upon the co-operation of the Scottish members in making this feature of the *Notes* worthy of the volume of which it will in future form a feature. Since the issue of the last Council Report a revised index to the eight completed volumes of the *Professional Notes* has been complied with a view of facilitating reference to their contents.

The Junior Meetings have been fairly well attended, but the Council would like to see a larger number of the younger members taking an interest in these meetings, which should have excellent results in developing their powers of thought and expression.

Particulars of applicants' qualifications have been furnished to upwards of one hundred employers, during the year, and it is known that in the majority of cases engagements have resulted. It is, however, impossible to give precise statistics, as in many instances no notification is sent to the secretary of the result of the introduction.

Something more than a bare allusion to the second country meeting, held this year at Bristol, on April 26 and 27, will be looked for in this report. It was attended by about 140 members, most of whom were present at the meetings in the reception room of the Council House, and dined together at the Grand Hotel in the evening. . . . . The Council are happy to learn that the visit to Bristol was regarded by those who took part in it as an unqualified success, and as likely to be conducive to a better knowledge and appreciation of each other by the town and country members of the Institution. . . . .

On the motion of Mr. Swain, seconded by Mr. Stower, it was agreed that the report and balance-sheet be received and adopted.

On the motion of Mr. T. A. Dickson, seconded by Mr. Pilditch, a vote of thanks was accorded to the auditors.

Mr. Harston then moved a vote of thanks to the President, Vice-Presidents, and other members of the Council for the able manner in which they had administered the affairs of the Institution during the past year.

Mr. H. Chatfeild Clarke seconded the motion, which was agreed to.

The Chairman acknowledged the vote of thanks, remarking that the work of the Institution was increasing, and it required the constant attention of the Council and their friends Mr. J. W. Penfold, hon. secretary, and Mr. Julian C. Rogers, secretary. The Institution was fortunate in having had the services of those two gentlemen for so many years.

On the motion of Mr. Warner, seconded by Mr. T. Jones, the thanks of the Institution were accorded to Mr. Penfold, Mr. Rogers, and the members of the staff.

Mr. Penfold and Mr. Rogers having suitably replied, a vote of thanks was, on the motion of Mr. R. Perry, seconded by Mr. C. J. Mann, passed to the scrutineers.

Prizes were then presented by the Chairman as follows:—The Institution Prize to Mr. H. A. A. Gate, of London; the Special Prize to Mr. A. G. Bradshaw, of Lancaster; the Penfold Silver Medal and the Driver Prize to Mr. G. Freeman, Wimbledon; the Penfold Gold Medal to Mr. S. A. Smith, Haverstock Hill, N.W. (Mr. Smith gained last year the Penfold Silver Medal and the Driver Prize); the Crawter Prize to Mr. F. J. Bowden, Barnstaple; and the Students' Prize to Mr. A. W. Leat.

On the motion of Mr. E. W. Rushworth, seconded by Mr. H. H. Collins, a vote of thanks was passed to the Chairman.

The Chairman replied. He then introduced the new President, Mr. Rickman, to the meeting, and invested him with the gold chain of office.

Mr. Rickman then took the chair, and expressed the pleasure it gave him to stand before them as their President.

Mr. Vigers said he had omitted to tell the meeting that he hoped shortly to make a start in connexion with a benevolent fund for the Institution. What was proposed to be done would be brought before the members shortly.

The meeting shortly afterwards concluded.

Hotel, Weymouth.—The new Royal Hotel at Weymouth, which was opened recently, has been built on the site of the old Royal. The new building contains over a hundred rooms, the electric light being installed throughout. Messrs. Creaton & Co. were the builders, and the architect was Mr. C. Orlando Law, of London.

## THE DISPUTE IN THE BUILDING TRADE:

### A SETTLEMENT.

A Conference was held on Tuesday morning, at the Salisbury Hotel, Fleet-street, between representatives of the Master Builders' Association and the National Association of Operative Plasterers, which resulted in the practical settlement of all points in dispute between the parties, and the dislocation of trade which has existed since February is now at an end. The representatives of the Master Builders who attended were Mr. Alderman Holdsworth, President of the Association; Mr. Benjamin Greenwood, London; Mr. J. W. Sugden, President of the National Master Plasterers' Association, Bradford; Mr. G. Nicholls, Leicester; Mr. J. Higson, Salford; and Mr. C. W. Green, of Liverpool. On behalf of the Operative Plasterers there were present: Mr. Mark Jones, President; Mr. M. Deller, General Secretary; Mr. D. Hennessey, London; Mr. H. Duckett, Birmingham; Mr. G. Jackson, Manchester; and Mr. A. McLeod, Newcastle-on-Tyne. The delegates chose Mr. E. T. Cook (Editor of the *Daily News*) as Chairman of the Conference. From the first there was an evident determination on both sides to arrive at a solution of the differences which had disturbed the trade.

After considerable but considerate discussion, the following terms of settlement were arrived at and signed:—

*Non-Union Foremen.*—With regard to Clause 1 (*a*) and (*b*) of the employers' "Manifesto," which alleges:—

The persistent attempt to coerce foremen of plasterers, of superintendents of plasterers' work into the membership of the National Association of Operative Plasterers; also:

The withdrawal of all members from the building firms employing such foremen or superintendents.

It is understood that the vote of the Plasterers' Association in London, in February, against this practice settles this point.

*Apprentices.*—With regard to Clause (2) which deals with the limitation of apprentices, it is agreed that, as this question is peculiarly complicated, different practices prevailing in different districts, both as to the extent to which apprentices are employed, and as to the ages at which they begin their apprenticeship, the question shall be referred to a special joint committee of both sides to draw up working rules to govern the matter. This Conference is of opinion that the difficulty with regard to the proportion of apprentices could best be solved by a provision that every apprentice should be legally bound.

*Boycotting and Blacklisting.*—With regard to Clause 3 (*a*) and (*b*), which charges the Plasterers' Association with:—

(*a*) The practice of boycotting certain building firms and employers of plasterers, in spite of the fact that such firms adhere to the rules agreed between the Master Builders' Associations and the National Association of Plasters.

(*b*) And the practice of printing and circulating amongst the members of the National Association of Operative Plasterers a list of such firms for whom they are forbidden, under penalty, to work.

It is understood that, while not admitting the accuracy of these allegations, the Plasterers' Association give an undertaking that no such boycotting or blacklisting shall take place in future where the firms adhere to the rules mutually agreed upon, the employers, on the other hand, giving a definite undertaking that such rules mutually agreed upon shall be strictly enforced in all parts of their contracts.

*Demarcation of Work.*—With reference to Clause 5 (*a*) and (*b*), which alleges:

(*a*) The refusal to accept the decision of the employer as to which workmen shall do certain work, in cases where plasterers dispute with other trades as to their right to do such work.

(*b*) Practice of withdrawing all their members when such work may not be placed in the plasterers' hands.

It is agreed that for the purpose of the demarcation of work, joint committees shall be established in the different districts equally representative of the employers and the mechanics, whose representation shall be equally divided amongst the different branches of the trade in question. These committees shall, as far and as soon as is possible, draw up schedules of the work which it is recognised belong to certain branches of the trade. To such committees shall be immediately referred all points of dispute as to demarcation, and the decision of the majority in each case shall be accepted as binding on both sides. Should they fail, however, to decide, then the matter shall be referred for settlement to similarly constituted joint committee representative of the National Association of Master Builders and the other societies affected, whose decision shall be final, provided that the employers' representatives are bonâ fide employers of plasterers direct. Pending such reference to the local committees no strike or lock-out shall take place, but the decision of the employer shall be provisionally accepted as to who shall do the work.

Provided that preference shall be given to that branch of the trade which, in practice, has done the work before in that district, and provided no preference be given on account of the payment of lower wages.

*Non-Unionists and Disputes.*—With regard to Clauses 4 and 6, which speak of

The refusal to work on buildings where some of the workmen employed may not belong to a trades union,

And of the objection to submit all trade disputes to discussion at a conference between employers and employed with a view to arrive at an amicable settlement prior to any strike or withdrawal of workmen,

It is agreed that, in the event of a dispute arising on any job or works, the District Officials of the National Association of Operative Plasterers shall send written notice to the Local Association of Master Builders, who shall inform them whether the said builder is a member of that body. If so, a strike shall not be sanctioned by the N.A.O.P. until six clear working days have expired from the receipt of such notice, during which time the matter shall be considered by the employers and the representatives of the workmen with a view to an amicable settlement. It is understood that the men the Operative Plasterers object to work with are defaulters, and other men who have been shown to the employers to have made themselves specially objectionable to the Union men.

*Foreign "Free Labour."*—It is agreed that where the employers are able to secure British plasterers to meet their requirements they will dispense with the services of the Continental plasterers engaged during the present dispute as their contracts may expire. The employers will not require members of the N.A.O.P. to work on the same buildings with such plasterers. The members of the N.A.O.P. shall raise no difficulties in fixing work prepared by the Continental plasterers.

Signed by Wm. Holdsworth, President; Benjamin J. Greenwood; C. W. Green; George Nicholls; James Higson; J. W. Sugden; H. G. Hassal, Secretary (on behalf of the National Association of Master Builders of Great Britain and Ireland); Mark Jones, President; D. Hennessey; A. McLeod; George Jackson; Henry Duckett; M. Deller, General Secretary N.A.O.P. (on behalf of the National Association of Operative Plasterers). (In witness) E. T. Cook (Editor of the *Daily News*), Chairman of the Conference; Clement Edwards, of the *Daily News*.

### GENERAL RULES.

The general terms of settlement having been agreed to, the representatives of each side retired to consider a suggested code of rules, submitted as embodying the general terms. This, however, the plasterers' delegates declared they were unable to accept, and the Chairman of the Conference was asked to draw up a code. This he did, and it was agreed to and signed as follows:—

1. The Plasterers' Association will not take any steps to control managing foremen of plasterers, or superintendents of plasterers' work, into the membership of the N.A.O.P.

2. (Apprentice—rules left for special joint committee to settle in accordance with the general agreement arrived at by the Conference.)

3. No boycotting or blacklisting shall take place by the N.A.O.P. in future where the firms adhere to the rules mutually agreed upon. The employers agree that such rules shall be strictly enforced in all parts of their contracts.

4. For the purpose of the demarcation of work joint committees shall be established in the different districts, equally representative of the employers and the mechanics, whose representation shall be equally divided amongst the different branches of the trade in question. These committees shall, as far and as soon as is possible, draw up schedules of the work which it is recognised belong to certain branches of the trade. To such committees shall be immediately referred all points of dispute as to demarcation, and the decision of the majority in each case shall be accepted as binding on both sides. Should they fail, however, to decide, then the matter shall be referred for settlement to a similarly constituted joint committee, representative of the National Association of Master Builders and the other Societies affected, whose decision shall be final, provided that the employers' representatives are bona-fide employers of plasterers direct. Pending such reference to the local committees, no strike or lock-out shall take place, but the decision of the employer shall be provisionally accepted as to who shall do the work, provided that preference shall be given to that branch of the trade which, in practice, has done the work before in that district, and provided that no preference be given on account of the payment of lower wages.

5. In the event of a dispute arising on any job or works the district officials of the N.A.O.P. shall send written notice to the Local Association of Master Builders, who shall inform them whether the said builder is a member of that body. If so, a strike shall not be sanctioned by the N.A.O.P. until six clear working days have expired from the receipt of such notice, during which time the matter shall be considered by the employers and the representatives of the workmen with a view to an amicable settlement. Failing a local settlement, reference shall immediately be made to a Central Joint Committee of the two Associations, and until five days have expired from the date of this reference, no strike or lock-out shall be sanctioned either by the N.A.O.P. or by the National Association of Master Builders. With regard to the alleged refusal of members of the N.A.O.P. to work with workmen who may not belong to a trade union, it is understood that the men the operative plasterers object to work with are defaulters and other men who have been shown to the employers to have made themselves specially objectionable to the union men.

6. These Rules shall be construed together, and in the light of each other.

The rules were signed as before.

Clause 2, as to apprentices, was left over to a committee to settle. This committee, consisting of three a side, sat in a separate room for an hour, but were unable to arrive at a definite settlement. The full Conference thereupon resumed its sitting, and after some discussion the chairman urged the following as a possible solution:—

> No employer shall engage any additional apprentices to the plastering trade whilst the number of his apprentices shall exceed one-fourth of the number of journeymen plasterers then employed by him. All apprentices shall be legally bound.

The proposal was unanimously agreed to.

It was understood that the National Association of Operative Plasterers will have to submit the terms of settlement to their members for approval before work can be resumed. This vote will be taken next week, so that in all probability the men will be back at work early in the following week.

## THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

THE thirteenth, and closing, meeting of the present session was held at 56, Great Marlborough-street, W., on the 26th ult., Mr. H. J. Leaning, Chairman of the section, presiding.

A paper was read by Mr. W. B. Hopkins on "Bacterial Methods of Sewage Purification, with special Reference to the Exeter Septic Tank."

Dealing with the question of the purity of the effluent from the treatment of sewage, Dr. Frankland some twenty-five years ago laid it down that there were three processes—filtration, irrigation, and chemical precipitation, all having as their object to free sewage from organic matter, either in *suspension* or (harder to deal with) in *solution*; and now science shows that bacteria have a great part to do in the oxidisation or the rendering innocuous to health of organic matter in sewage, and the results arrived at thus far by experts seem to show that by the action of two classes of organisms—firstly, aerobic, those that work in the presence of light and air; anaerobic, those which need to be kept from both light and air; and, secondly, organisms which attack organic matter in solution. Sewage can be purified, and a "filtrate" obtained finally free from all harm, bright and clear, and the engineer has to create conditions favourable to the growth of such organisms, adding no chemicals and keeping the temperature above freezing point.

Mr. Hopkins then described in detail the working of the septic tank at Exeter as laid down by Mr. Donald Cameron, the City Engineer. The plant consists of a large covered-in tank sufficient to take the sewage of one day, and for this suburb of Exeter (St. Leonard's) was about 64 ft. by 18 ft. wide and average 7 ft. 6 in. deep. Here the sewage passed slowly through and the effete matter was acted upon by the bacteria, so that practically no solid matter remained beyond a thick scum of floating material highly favourable to microbes. The sewage then passes through a slotted pipe at the further end of the tank and discharges on to one of five filter beds (about 80 square yards in area and 5 ft. deep, filled in with broken clinkers and coke) used in rotation; where, acted upon by aerobic microbes the effluent is rendered quite innocuous, and the final filtrate as discharged into the river Exe is considered highly satisfactory.

A similar plant has been laid down in Yeovil, in Somerset, and though it deals with the sewage from manufactories and breweries, a filtrate has been obtained by this process which has been pronounced to be satisfactory.

To architects, in conclusion, it meant that by means of an enclosed and sealed cesspool, and small filter beds, and some simple automatic apparatus connected with the same, the disposal of sewage to isolated houses or mansions in the country was rendered practicable, innocuous, and comparatively inexpensive.

A discussion ensued in which most of the members present joined. Mr. Max Clarke stated he had used a similar tank many years ago, which still worked with admirable results, and Mr. George Smith called attention to the lecture by Dr. Rideal before the Society of Arts as being, perhaps, the most advanced treatise on this important subject. Mr. Sydney Beale, Mr. Brodie, Mr. Taylor, and the Chairman also took part in the discussion.

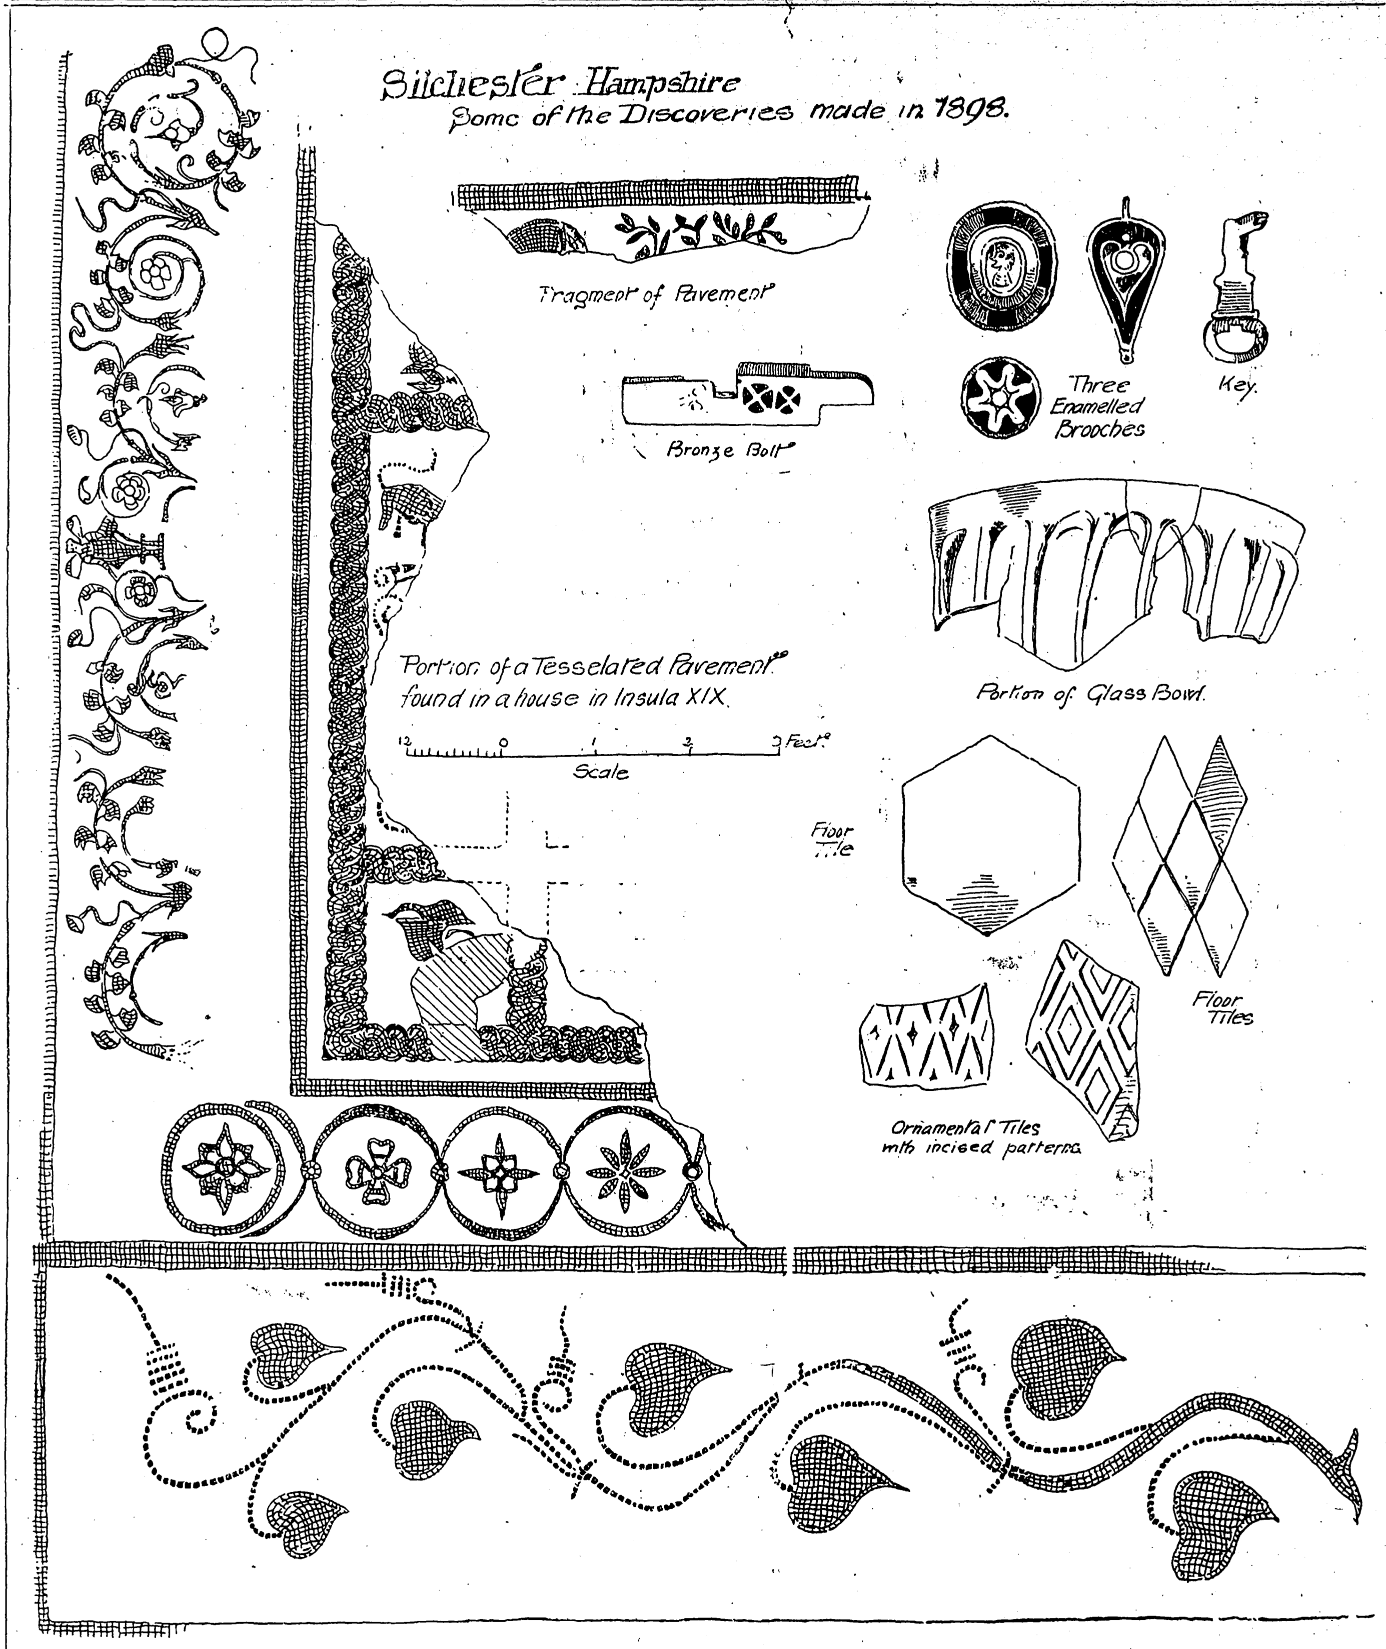
The meeting closed with a hearty vote of thanks to Mr. Hopkins; and also to Mr. H. J. Leaning and Mr. C. H. Strange, the retiring Chairman and Secretary respectively, for the successful discharge of the duties laid upon them during the session now ended.

## *ARCHITECTURAL SOCIETIES.*

GLASGOW INSTITUTE OF ARCHITECTS.—A general meeting of this Institute was held on the 25th ult. in the rooms, Pitt-street, Mr. David Barclay, President, in the chair. The Chairman gave a summary of the business transacted by the council during the past quarter. The Corporation's Committee on Building Regulations had acceded to the suggestion of the Institute that a conference should be held between that committee and the representatives of the Institute while the clauses of the proposed new Bill were being considered, and before they had been passed by the Corporation. A committee of the Institute had had a meeting with the Corporation Committee, who considered it desirable that they should be favoured with the views of the Institute upon the existing building regulations and any alterations, amendments, or conditions which the Institute might suggest, especially as to the question of the height of buildings. As to the new matters which the Corporation might propose to deal with in the Bill, their Committee had promised to show these in draft to the Institute. The Secretary reported that the Royal Institute had decided to support the principle of Lord Russell's Bill on Secret Commissions, now before Parliament, and had assured him of their hearty co-operation and their sympathy with the objects of the Bill, and that the action they had taken in this matter generally was very similar to that which had been taken by the Council of the Glasgow Institute. It was also reported that the Royal Institute had agreed to their annual dinner in 1901 being held in Glasgow early in October of that year before the close of the exhibition, and it was resolved that a local committee be formed to make suitable arrangements for the occasion. The Institute agreed to take charge of the examinations for this district of the Royal Institute, which will be held in Glasgow during June, provided a sufficient number of candidates come forward for examination.

## *COMPETITIONS.*

NEW WHOLESALE MARKET, LEICESTER.—On October 25 last the Council authorised the Market Committee to invite architects practising in Leicester to prepare designs in competition, and offered premiums of 100*l*., 50*l*., and 25*l*. for the three best designs. In accordance with the conditions of competition the Committee appointed Messrs. Leeming & Leeming to act as assessors. The awards have been made as follows:—First premium (100*l*.), Mr. Walter Brand, A.R.I.B.A., 16, Bishop-street; second premium (50*l*.), Mr. A. H. Hind, A.R.I.B.A., Greyfriars; third premium (25*l*.), Messrs. Blackwell & Thomson, Halford-chambers. The author of the design which has been awarded the first premium estimates the cost as follows:—Markets, 24,087*l*.; cold storage, 6,417*l*.; baths extension, 1,329*l*.; total, 31,833*l*., which estimate Messrs. Leeming & Leeming state they have gone carefully into, with practically the same results as the competitor. On Tuesday last week the Markets Committee recommended the Council to authorise them to appoint Mr. Brand to act as architect, and this was adopted.



## EXCAVATIONS AT SILCHESTER.

DURING the past twelvemonth the excavations on the site of the Roman city of Silchester, near Reading, have been continued, and the result is now to be seen in an interesting exhibition which is being held in the rooms of the Society of Antiquaries at Burlington House. It remains open until June 10.

The portion of the site investigated was in the south-west angle of the city, numbered on the plan as *Insulæ* xix. and xx. *Insula* xx., near the outer wall, and close to the south of the west gate, contained nothing of any great architectural importance, but a curious detached hypocaust was discovered similar to those discovered in 1897. The chief object of interest in *Insula* xix. was a large house of early date with fine hypocausts. Remains of an earlier house were found at a lower level, and to this earlier building belongs the fine piece of pavement which we are able to illustrate by the kind permission of the Society of Antiquaries. Its date has been placed as early as A.D. 80, and is the earliest pavement hitherto found. Two peculiarities may be noticed—the ground work of the pavement is of white tesseræ. and the braid ornament, generally so prominent a feature, here takes a secondary place. The outer black border was continued to the wall in each case. The central panel, of which only a fragment remains, was subdivided by braid ornament, and the panels had representations of foliage and animals. The broad ornamental border that surrounded this panel varied. On one side was a series of circles with centre conventional ornaments, and a boldly treated wavy representation of convolvulus leaves and tendrils in black tesseræ. On the other three sides were very beautiful borders of finer design and workmanship, of distinctly superior character to anything hitherto found in England, and approaching in detail more to the patterns already found at Pompeii. The colours used are black, white, red, and various grey tints, amongst the latter being many tesseræ composed of Purbeck marble. There is the usual pottery, some stamped with the makers' names, but nothing that calls for special notice. Among the smaller objects of interest are several bronze fibulæ and other ornaments, and three enamelled brooches, which we illustrate. The oval brooch has red and black enamel in the border, and a curious paste intaglio; it is about $1\frac{1}{8}$ in. broad and $1\frac{1}{4}$ in. long. The circular brooch has a groundwork of dark blue enamel. This also occurs in the outer part of the pear-shaped example, the inner part being red and the small central circle yellow.

There are also several portions of very beautiful glass bowls of a pale blue colour.

Beyond the pavement already noticed there is nothing of much architectural interest, but among some smaller objects found are specimens of floor and ornamental tiles.

The excavations are still being carried on at Silchester, making the tenth season, and funds are much needed for the carrying out of the work in the same efficient manner as hitherto.

## THE ARCHITECTURAL ASSOCIATION:

### ANNUAL DINNER.

THE fifty-second annual dinner of the Architectural Association was held on Wednesday evening last at the Holborn Restaurant. The chair was taken by Mr. G. H. Fellowes Prynne, the President, and among those present were: Venerable Archdeacon Sinclair, Sir Edward Clarke, Q.C., M.P., Sir Henry H. Howorth, M.P., and Messrs. C. A. Adams, R. S. Balfour, R. Blomfield, T. Blashill, A. Bolton, F. Bond, L. Butler, G. B. Carvill, W. E. Davis, F. R. Farrow, A. S. Flower, B. F. Fletcher, H. L. Florence, F. T. W. Goldsmith, Edwin T. Hall, H. T. Hare, A. H. Hart, E. Swinfen Harris, F. G. F. Hooper, W. J. Locke, F. W. Macey, P. J. Marvin, E. W. Mountford, Beresford Pite, W. A. Pite, F. W. Pomeroy, Dr. G. V. Poore, H. W. Pratt, E. A. Fellowes Prynne, J. C. Preston, W. E. Riley, E. Howley Sim, John Slater, W. H. Seth-Smith, H. H. Statham, C. H. Strange, R. H. Weymouth, A. W. Weedon, and W. White.

The Chairman proposed the toast of the Queen and Royal Family, which was duly honoured, and he then gave in one toast "The Church," and "The Houses of Parliament." The Church, he said, had in all ages been closely allied with architecture, and had had an incalculable influence upon their art, while that art in turn had exercised the greatest possible influence upon the Church and upon religion. Referring to the recent controversy in regard to the decoration of St. Paul's, he said he felt that the Dean and those interested in the work had the highest and noblest motives, and that the artist who had undertaken the decorations deserved all praise for the wonderful interest and industry which he had thrown into the work. But as architects they could not consider this matter only from the church point of view. They looked upon St. Paul's Cathedral as a national monument of architecture, designed and created by one of the most able architects England had ever produced, and therefore they felt that they as architects were directly interested in preserving this great work of a past generation. Sir William Richmond, in his letter to the *Times* the other day, adopted a very haughty tone, ignored the architect's profession altogether, and at the same time accused them of unprofessional conduct in the way in which they had raised this question. They desired to be in every way courteous to Sir William Richmond, but they could not look on and see this noble monument being utterly ruined, and the main lines of the building completely destroyed, without protesting. Sir William Richmond looked upon St. Paul's Cathedral as "a magnificent skeleton," to which he was able to give life by his colour and decoration. They could not agree with that. They looked upon the cathedral as a noble form already designed. No powder and paint were needed to improve it, and they must have the architectural lines kept intact. If any architect wished to experiment upon the walls of a building, the walls of this great national monument were not the right walls for such an experiment. Proceeding to deal with the Houses of Parliament, he remarked how little was done by the Legislature to encourage architecture and the building of great historical monuments which would tell to future ages the kind of people we were. How poorly the money expended in our great, rich England on architecture compared with that spent by a little nation like Belgium! It was a shame that a rich nation like ours should cut down the cost of its great public buildings, as had again and again been done. It was utterly unfair to condemn solely the architect for destroying the plan of the Law Courts, when they remember that he had been compelled to cut the cost down by three-quarters of a million. How could they expect that plans treated in this way after they were made would be satisfactory? Let the legislature think of architecture not merely as a thing to spend so much money upon, but as a thing that wrote the history of the nation in stone for all future ages, and let them create monuments more worthy of the country; monuments which, like those of Greece and Rome, would never be effaced.

Archdeacon Sinclair, in responding on behalf of the Church, said that part of his duty was to inspect the fabric of the churches, and he was struck by the very common fault of the absence of ventilation. Too much trust was placed for this purpose in doors and windows, and the result naturally was that large congregations grew heavy and stupid. He would like to see every church with a row of handsome ventilators breaking the sky-line of the roof. In another church he found the doors were so narrow and beautiful that it was impossible to get a coffin into them, so that they saw that practical knowledge was sometimes wanting even to the artistic and eminent architect. There were certain practical considerations that those who used churches might suggest to those who built them. But he admitted that the Church owed a great deal to the architects. The restoration of St. Saviour's, Southwark, reflected the highest credit on the architectural skill of the present day, and also the magnificent work that had been done at St. Bartholomew's, Smithfield. St. Philip's, Stepney, was a church of noble proportions and beautiful style, and showed what could be done when funds were liberally provided. Architects to-day were very conservative, but he could look back to the fifties, and could remember the ruthless way in which things were swept away because they were Renaissance or Elizabethan, and not in harmony with the original Gothic intention of the church. Thus history has been swept away all over the country under a purist Gothic impulse on the part of eminent members of the architectural profession. So they must remember when they gave their advice that the advice of their predecessors had not been always the wisest that could be given. As to the decoration of St. Paul's, the decoration committee welcomed the frankest and freest criticism and advice. He did not set up, and they did not set up, to be eminently qualified to judge on this question. The idea of the Dean had been to place himself in the hands of one recommended as a skilled expert in the question of decoration. He thought the committee was at present too weak to bear the strain of so great a work. They ought to have some architects versed in Palladian work and able to separate Palladian ideas from Gothic ideas, and also in full sympathy with Sir Christopher Wren. He also thought that they ought to have the assistance of the President of the Royal Academy, and perhaps the President of the Beaux-Arts in France, and possibly someone corresponding in Germany. In a matter of such great importance they ought to have the most consummate and able advice it was possible to get. Coming to the history of the question, he would remind them that Sir Christopher Wren did consider the place incomplete when he had finished the last stone, and he sent for four artists from Italy to do the mosaics, but he did not receive the sympathy of the committee who were raising the funds, and the artists had to be sent back again. To the day of his death Wren considered that the cathedral was incomplete. Not much was done until about twenty-six years ago, when the decoration committee was formed. The committee were long divided in opinion, and Mr. Burges, the architect, recommended a scheme which would have cost 450,000*l.*, and which would have covered the whole space with marble except where gilding and mosaics were intended. The scheme would have frightened the present generation even more than the scheme of to-day. At last the committee began with the reredos. He really hoped future generations would remove part of that reredos. It was originally intended only to have the middle piece, with light golden grilles, which would show the beautiful apse, which was now concealed. Then he hoped that future generations would remove the coloured glass windows, which, however suitable to a Gothic building, had made the chancel of St. Paul's simply a dark vault, in which none of the details could be distinguished. After the reredos had been put up the eminent architect who had been responsible recommended the Dean to take the advice of Sir William Richmond as to the mosaics. Sir William Richmond had been most self-denying, and had given up all other work for most moderate remuneration. It was true, as had been announced in the papers, that the committee had determined to remove the stencil-work. Sir Christopher Wren's own design included curtain work festooned with ropes, and stout cherubs holding up the ropes. But, of course, they were not bound to carry out the style of ornament of that day. Sir William Richmond had written agreeing with the decisions of the committee, and he believed that the result of this discussion would be satisfactory to the artistic and instructed minds of this country.

Sir Henry Howorth, M.P., responded for the Houses of Parliament, and with regard to the suggestion that Parliament did little for architecture, he pointed out that when nations were making history they were rarely artistic. When Nero performed the great public service of burning down Rome, it was Greek artists who were called in to rebuild the city. Our country had been more fortunate than Rome. We had a great series of buildings going back right to our earliest history, that for many of their qualities could not be matched. When we were masters of two-thirds of France our architects went there and not only taught the art but created some of the finest of the buildings of that country.

Mr. H. H. Statham then proposed the toast of "The Royal Academy and the Royal Institute of British Architects." The Royal Academy holds an annual exhibition where every year they might hear people saying: "Very poor Academy; nothing worth looking at," but they kept on going all the same. One of the rules of the Academy was that "no mere transcripts of objects of natural history" were admitted, and he had sometimes wondered how many works might be kept out on that ground. It was rather curious, and characteristic of modern times, that wherever there was an old-established exhibition there was a rival which professed to go further. In Paris, ten years ago, there was a split in the Salon and a new one was founded, which professed to be the artistic and poetic Salon *par excellence*, leaving the other to the popular mind. The New Gallery took the same place in relation to the Academy. Yet he did not believe there had been any year in which they could not find enough good pictures in the Old Salon or the Academy to crush their rivals. The difficulty was the large amount of mediocre work admitted. Architects made the very reasonable complaint against the Academy that it acted practically as if "art" meant "pictures." They spoke of architecture as the mother of the arts, but the mother of the arts was put in a hole. Decorative art was spoken of, but it had very little representation in the Academy. They had a right to expect better things, and that the Academy should give larger space to architectural design, and decorative work, and teach the public that art was art, and not merely painting of pictures. There was one thing about the Academy which was not sufficiently recognised. It could not create genius, but it could promote artistic education and uphold the standard of technique. Violent things had been said about the Academy for refusing to elect certain great artists, men who were said to be greater geniuses than most of the Academicians. Rossetti was one of those of whom this was said, but Rossetti himself admitted that he did not, and could not, draw the figure correctly, and did not care. In that case the Academy was right in excluding him. It might be said his pictures, though not well drawn, were worth more to the intellect than some Academic pictures that were well drawn. But that was beside the point; the Academy could decide upon technique, it could not decide whether a man was a genius. And now they came to the point of the connexion between the Academy and the Institute of Architects. The Institute had been assailed by people who said that they represented the art of architecture, and that the Institute did not. In the first place, the Institute was on a different plane from the art of painting and sculpture. It dealt with architecture as a profession. There was a great difference between giving a man two or three thousand pounds to paint a picture and giving him the spending of half a million on a building. For the latter he must be a practical man. The Institute could not make a genius any more than the Academy. But the Institute could insure that the standard of technical education had been kept up. That was what the Institute had been diligently trying to do lately, and it was the one thing it could be certain of. It could not say to one man, "You are an architectural genius," and to another, "You are not;" but it could take one man's work and say, "You are thoroughly educated as an architect," and to another, "You are not." He coupled the toast with the name of Mr. Aston Webb, whom he congratulated on his admission to the Royal Academy, feeling sure that he would work for getting architecture better representation in that body; and also with the name of Mr. H. L. Florence.

The toast having been duly honoured,

Mr. Aston Webb, A.R.A., responded on behalf of the Academy, and at the same time referred to the fact that ladies were now admitted to the Institute of Architects, as a proof that the Institute was prepared to move forward with the times.

Mr. Florence also responded, and said that they looked to the younger members of the profession for the conduct of the Institute in the future. Those younger members had a quality not inherent in ancient and well established institutions, they had enthusiasm, and that enthusiasm would be of the greatest value to the Institute if they would join it. Many of them if they lived long enough might become Royal Academicians, but in the meantime there was something within their reach; by mutual education and by offering themselves for examination they might all become members of the Royal Institute of British Architects.

Sir Edward Clarke, M.P., then gave the toast of the evening, "The Architectural Association," coupled with the name of the President. The Architectural Association, he understood, was an educational body connected with the great art to which most of those present had devoted their lives. It was a body which, after living for rather more than fifty years, was now in the full stream of success, and had attained a position of great influence and authority in the architectural world. It had its classes, its lectures, all the organisations which helped in the promotion of a great profession. He spoke of their great art because architecture was, after all, an art—one of the greatest, and one the study of which was, he thought, more difficult, more full of complex problems, making more demands upon the capacities of the men who devoted themselves to it than any other art he knew. It was an art, that no one could deny; but at the same time it was an applied art, with a scientific side to it, and he had always felt that among the many occupations to which a man could give his life there was none that combined a greater degree of enjoyment of artistic life with the responsibility of scientific study. The great art of architecture was limited and controlled by considerations which did not affect what he might call the more mental arts, by questions of expenditure upon the production of its works. It was limited and controlled by questions of convenience on the part of persons who were going to use those works when produced. A painter would never think of drawing half a tree instead of a whole one because it would save him paint and canvas, and he never heard of a sculptor who made the arm of his figure half the length it ought to be in order to save the expense of marble. But architects unfortunately applied their art to what he might call the ordinary and minor interests of life, and they were limited and controlled severely by matters which had no relation to art at all. The committee that presided over the erection of one of those architectural triumphs which they had hoped to make was often a serious difficulty, because architecture was one of those matters, as they had had evidence that evening, upon which every one was competent to speak with authority. Then they were limited by questions of finance. It was not only the matter of expense in the work that had to be done. But unfortunately the best possible house that they could design was interfered with and spoilt by the man who was going, not to look at the house, but to live inside it. He might consider, for instance, that a serious modification ought to be made in the matter of a bath-room. The limitations of expenditure in production, and of the desires of the persons who were going to inhabit the productions when made, were serious limitations. It was remarkable that, with all these difficulties, architecture had been so successful. This was the wealthiest country that had ever had to deal with the administration of public affairs and the housing of public officials, and it had had to erect great masses of architecture. As to the way in which that had been done, they had already been reminded of the miserable history of the Law Courts, which, he thought, might be supplemented by the treatment accorded to Sir Gilbert Scott's design for the Foreign Office. Considerations of economy or taste in high but uninstructed places had interfered with the designs of our architects, and, considering the circumstances, he thought they had done remarkably well. Architecture was really the only art he knew in which the sense of beauty was brought to bear as an essential element and consideration in that which was really the application of the constructive arts to the ordinary necessities of life. Dwellings must be built for men, and they took various forms according to the progress of our civilisation, and these dwellings must be built, not with reference to artistic perfection, but to the interests and desires of those who dwelt in them. The trials and difficulties of the architect's life must be very great. The course of study he had to go through was more complex and difficult than that required for any other art. It involved business capacities as well as artistic powers, capacities which were disregarded and scorned in the more abstract forms of art. What architecture had been to the world it was almost impossible to realise. It had been an education to the world in the love and knowledge of beauty to a greater extent than any of the more abstract arts of painting and sculpture. A piece of sculpture or painting was produced, passed through two or three galleries, and then was carried off to a rich man's house, and was seen no more except by a few of his friends. But architecture, whether in the form of a great public institution or of a private house, was perfect in its design and characteristics, was a pleasure and delight to all who passed by, an education in art to every eye that saw it, and a pattern in artistic virtue to every one who came after and studied it. He passed on to speak on the enormous effect on the world of architecture as applied to religious buildings. In every creed, under every sky, whatever the character of the religion might be, the worshippers who went within the walls of the temple found inspiration in its architecture. The finest examples of architecture to be found in the world of their class were those Indian temples the magnificence of which showed that the architect had been allowed, with almost illimitable resources, completely to work out his plans. But no one who had been into some of the great cathedrals of Europe could doubt for a moment the effect of the architecture upon the worshippers. No one had stood at the door of that wonderful dream of white marble which stood in Milan without being deeply inspired by religious sentiment at the sight of that magnificent triumph of ecclesiastical art devoted to the service of God. Any one who had sat in absolute silence and contemplation in the great cathedral of St. Mark's in Venice, with its wonderful colours of mosaic and marble, must have felt what architecture had been through the centuries gone by, and would still be, if it was true to its mission, in the centuries to come, one of the greatest and noblest teachers, and one of the highest inspirations it was possible for man to have. In conclusion, he coupled the toast with the name of their President, whom, he was glad to know, they had elected to that office a second time. He knew Mr. Fellowes Prynne as one of the most conscientious, sympathetic, instructed, and artistic of those who had devoted themselves to the work that Association desired to promote.

The President, in responding to the toast, said that the Architectural Association was practically the only really systematic society for the education of architects. It was *the* Association that had endeavoured in the past, and would endeavour in the future, to uphold education in architecture. Not only students were members, as they had only 200 students in a membership of 1,300. The others were men who had passed through its ranks and remained in the Association; and, as they knew, Mr. Aston Webb, their past president, and many others who had been presidents and vice-presidents and officers in the Association still remained among its members. Older members of the profession had joined simply to support the educational advantages the Association offered, not for themselves, but to help others. During the past session some most interesting papers had been read. In the one on the "Housing of the Poor" they anticipated something rather dull; but, instead of that, they were extremely interested. He asked the students to keep up their enthusiasm, and not to let it slacken as the session went on. Enthusiasm was the life of their work.

Mr. Beresford Pite then gave the health of "The Guests," coupled with the names of Mr. J. C. Preston, Master of the Carpenters' Company, Alderman Hind, Master of the Plumbers' Company, and Mr. Reginald Blomfield. He expressed the gratitude of architects to the Carpenters' and Plumbers' Companies for having taken in hand the education of the crafts with which they were connected. It was well that an occasion like that was provided for bringing architectural students in contact with the criticism of the outside world. Nothing would further the interests of architecture more than practical criticism like that which had been given them by the Archdeacon of London and Sir Henry Howorth. It was exceedingly difficult, struggling with the business problems of life and the technical questions which claimed their attention, to live in that ideal atmosphere necessary for the production of a great work of art. Such sympathetic criticism as was elicited by the Cathedral at Milan, or St. Mark's at Venice, was criticism that took stock of the whole work of an age. Each of these buildings was the production of an era, the concentration of the art of a world. How was the student, amid the cares of dealing with the builder and the County Council, to live in that atmosphere which only the most transcendental philosophy could provide him with? They had an illustration of what might be the effect in the works of Ruskin. Ruskin set himself to analyse the charms which he felt at Venice, and the result was wholly disastrous to English architecture. The result of "The Stones of Venice" was the erection of the Oxford Museum which evoked a chorus of admiration, but which had now become a mere laughing stock. They had to read Ruskin carefully before they could even understand the motive underlying such a building, yet it was built in this nineteenth century by a nineteenth century architect. It was exotic, an illustration of the application of Venetian philosophy to the English life of to-day.

Alderman Hind, in responding, said that in past years architects had often been caused much trouble by the carelessness and ignorance of the workmen in the plumbing trades. He was glad to believe that now to a large extent they got good work and a knowledge on the part of the workmen of the requirements of the times.

Mr. Reginald Blomfield also responded, and said that the Association was the best of the educational bodies dealing with architecture, and had pursued its work without any great help from outside sources for over fifty years. He hoped that it would add to its services by leading young architects to go in for a plain, simple, masculine style of work.

Mr. F. T. W. Goldsmith then proposed the health of the lecturers and instructors, and the committee and officers of the Association, Mr. H. A. Satchell and Mr. E. Howley Sim responding. The last toast was that of the President-elect proposed by Mr. W. H. Seth Smith.

## APPLICATIONS UNDER THE LONDON BUILDING ACT, 1894.

AT the meeting of the Building Act Committee of the London County Council held on May 15, being the day before the Council adjourned for the Whitsuntide recess, the proceedings were governed by the clause in the order of reference which empowers the Committee at certain seasons to act on behalf of the Council in relation to matters included in the order of reference. The following applications under the London Building Act, 1894, were considered. Those applications to which consent has been given are granted on certain conditions.*

### *Lines of Frontage.*

*Chelsea.*—Buildings upon plots 1 to 4, Cheyne-walk, Chelsea, to abut upon Beaufort-street (Messrs. Lethaby & Troup for the Town and Gown Association, Limited, Edinburgh).—Consent.

*Hampstead.*—The retention of bay windows in front of Nos. 79 and 81, Greencroft Gardens, Hampstead (Mr. W. H. Cove).—Consent.

*Hampstead.*—A porch at the side of a building in course of erection on the north side of Frognal-lane, Hampstead, to abut upon Chesterford Gardens (Mr. E. Michael).—Consent.

*Islington, North.*—A one-story shop on a portion of the forecourt of No. 121, Stroud Green-road, Islington (Mr. F. L. Pither for Mrs. Blankley).—Consent.

*Kensington, South.*—A tile-covered wooden hood over the entrance to No. 64, Holland Park-avenue, Kensington (Mr H. E. Rossiter for Mr. F. P. Wilson).—Consent.

*Lewisham.*—Bay windows to seven houses on the west side and seven houses on the east side of Broadfield-road, and also to six houses on the west side of Well-meadow-road, St. Germain's Estate,

---

* Names of applicants are given in brackets. Buildings are new erections unless otherwise stated.

Hither Green, Lewisham (Mr. G. F. Logsdail for Mr. A. Cameron Corbett, M.P.).—Consent.

*Norwood.*—A one-story entrance lobby to the "King's Head" public-house, No. 82, High-street, West Norwood (Messrs. Witherington & Hogwood for the New Phœnix Brewery Company, Limited). —Consent.

*Norwood.*—A building on the site of No. 202, Knight's Hill-road, West Norwood (Mr. C. F. Thwaite).—Consent.

*Westminster.*—A two-story oriel window at the "Old Red Lion" public-house, No. 48, Parliament-street, Westminster, to abut upon Derby-street (Messrs. Gardiner & Theobald for Mrs. Smith).—Consent.

*Brixton.*—Re-building of Christ Church, Brixton-road, Brixton, at the corner of Chapel-street (Mr. Beresford Pite for the vicar and churchwardens).—Refused.

*Clapham.*—A one-story shop on part of the forecourt of No. 103, Clapham Park-road, Clapham (Mr. J. M. Cable for Mr. T. F. Roper).—Refused.

*Greenwich.*—A one-story building upon the yard at the rear of No. 238, Woolwich-road, Greenwich, to abut upon Dupree-road (Messrs. J. Davey & Co. for Mr. H. Panter).—Refused.

*Marylebone, West.*—A one-story addition upon the yard on the east side of "The Yorkshire Stingo" public-house, No. 183, Marylebone-road, St. Marylebone (Mr. W. Pywell for Mr. S. Brown).—Refused.

*St. Pancras, West.*—A building on the north side of Hawley-crescent, St. Pancras, at the corner of Kentish Town-road (Messrs. W. Bradford & Sons for the Camden Brewery Company, Limited).—Refused.

*Westminster.*—Three iron and glass shelters at the entrances to Wellington Chambers, York-street, Westminster (Mr. G. Simpson for Mr. C. V. Houssart).—Refused.

*Woolwich.*—A one-story addition in front of the "Barrack Tavern" public-house, Woolwich Common, Woolwich (Messrs. Dear & Winder for Mr. T. Bond).—Refused.

### *Width of Way.*

*Paddington, South.*—A fives-court at the rear of Nos. 10 and 11, Orme-square, Bayswater, at less than the prescribed distance from the centre of St. Petersburgh-place (Messrs. C. Saunders & Son for Mr. H. Wilkinson).—Consent.

*Southwark, West.*—A building on part of the yard in front of No. 17, Bankside, Southwark, adjoining Southwark Bridge (Messrs. Fowler & Hall for Messrs. Beck & Pollitzer).—Consent.

*Whitechapel.*—A warehouse on the west side of Tenter-street West, Whitechapel (Messrs. Dunk and Bousfield for Mr. S. Moses).—Consent.

*Camberwell, North.*—A two-story factory on the north side of Bullace-row, Camberwell-road, Camberwell (Mr. E. J. Strevens for Mr. Wolsey).—Refused.

*St. George, Hanover-square.*—A projecting oriel window to abut upon Grafton-street, and a porch to abut upon Hay Hill, to a proposed building upon the site of Nos. 1 and 2, Grafton-street, St. George, Hanover-square, at the corner of Hay Hill (Messrs. Boehmer & Gibbs).—Refused.

*Southwark, West.*—A building on the north side of Old Barge-house-street, Blackfriars (Mr. W. C. Jones for the Thames Bank Iron Company).—Refused.

### *Space at Rear.*

*Deptford.*—A building on a portion of the open space at the rear of the "New Cross Inn" public-house, No. 323, New Cross-road, at the corner of Clifton Hill, Deptford (Messrs. Eedle & Meyers for Mr. W. G. Wrigglesworth).—Consent.

### *Deviation from Certified Plans.*

*Strand.*—Certain deviations from the plans certified by the District Surveyor, under Section 43 of the London Building Act, 1894, so far as relates to the proposed rebuilding of the "Golden Lion" public-house, No. 25, King-street, St. James, Westminster (Messrs. F. J. Eedle & Meyers for Messrs. Ferris & Co.).—Consent.

*St. George, Hanover-square.*—That Messrs. Bird & Walters be informed, with respect to their communication, purporting to be an application under Section 43 of the London Building Act, 1894, for sanction to deviations from the plans certified by the District Surveyor, so far as relates to proposed alterations to the "Coach and Horses" public-house, No. 5, Hill-street, Berkeley-square, St. George, Hanover-square, that having regard to the fact that it is not proposed to erect a building but to alter an existing one, the matter is one which, the Council is advised, cannot be the subject of an application under Section 43, and that the Council has accordingly neither considered their communication as an application nor given any decision thereon.—Agreed.

### *Lines of Frontage and Width of Way.*

*Hoxton.*—A building on the west side of City-road, Hoxton, between Baldwin-street and Brunswick-yard (Messrs. M. W. King & Son for the Trustees of the Alexandra Trust).—Consent.

*Lewisham.*—A one-story shop upon the forecourt of No. 4, The Chestnuts, Bell Green, Lower Sydenham (Messrs. A. Black & Son for Mrs. W. Banham). —Consent.

*Marylebone, East.*—That the application of Messrs. Leggatt, Rubinstein, & Co. for an extension of the period within which the erection of an iron and glass shelter at Queen's Hall, Langham-place, St. Marylebone, at the corner of Ridinghouse-street, was required to be commenced, be granted, upon condition that the shelter referred to be commenced within twelve months from November 15, 1898.—Agreed.

*Marylebone, West.*—One-story addition in front of the coach-house at No. 14, Montagu-square, St. Marylebone, to abut upon Gloucester-mews, West (Mr F. W. Foster for Mr. H. S. Willis).—Consent.

### *Line of Frontage and Deviation from Certified Plans.*

*Camberwell, North.*—A porch at the entrance to a building on the site of Nos. 45 and 47, Albany-road, Camberwell, and certain deviations from the plans certified by the District Surveyor under Section 43 of the London Building Act, 1894, so far as relates to the erection of such building (Mr. A. J. Perriam for the North Camberwell Radical Club and Institute).—Consent.

### *Lines of Frontage, Width of Way, and Space at Rear.*

*Wandsworth.*—That the Council, in the exercise of its powers under Sections 13 and 22 of the London Building Act, 1894, do not consent to the frontage and position of three blocks of proposed residential flats, two of such blocks on the south side of Oldridge-road, and one block on the east side of Lochinvar-street, Balham, at the corner of Holly-grove, with the forecourt boundary at less than the prescribed distance from the centre of the latter street, and that the Council, under Section 41 of the 1894 Building Act, do not allow or sanction the erection of such blocks of flats with open spaces at the rear and portions to extend above the diagonal line as directed by the Act to be drawn (Mr. H. F. Williams for Mr. G. Treeves).—Agreed.

*Islington, North.*—That the Council, in the exercise of its powers under Sections 13 and 22 of the London Building Act, 1894, do not consent to the position and frontage of twenty-two four-story houses, with shops on the ground floor, and of one-story shops in front of two houses on the north-east side of Archway-road, Holloway, with the flanks of two of the proposed four-story houses to abut upon a footpath leading from Archway-road to Hornsey-lane, and the flanks of one other four-story house and of one of the one-story shops to abut upon a footpath leading to Alpha-villas; and that the Council, under Section 41 of that Act, do not allow the erection of eight of such houses without an open space at the rear (Mr. C. J. Bentley for Mr. J. C. Hill).—Agreed.

### *Lines of Frontage and Construction.*

*Rotherhithe.* — A steel gangway across Shad Thames, Rotherhithe, to connect Bengal Wharf with a warehouse on the opposite side of that street, and also of two wood and iron lookums at the fourth-floor level of such warehouse, overhanging St. Saviour's Dock (Messrs. Garbutt & Co., Limited).—Consent.

*Islington, East.*—Advertisement boards on top of the open wooden fence and party fence walls, inclosing the forecourt of Nos. 4, 5, 6, 7, 8, 9, and 10, Kingsland-green, Dalston (Mr. J. Webster for Messrs. J. Gliksten & Son).—Refused.

### *Buildings for the Supply of Electricity.*

*Hammersmith.*—That the Council do not approve of the plans submitted with the application of Mr. H. Mair on behalf of the Vestry of Hammersmith, for the construction of an addition to the Vestry's electric generating station and works, Fulham Palace-road, Hammersmith, and that the Council also do not authorise the erection of such addition. —Agreed.

### *Formation of Streets.*

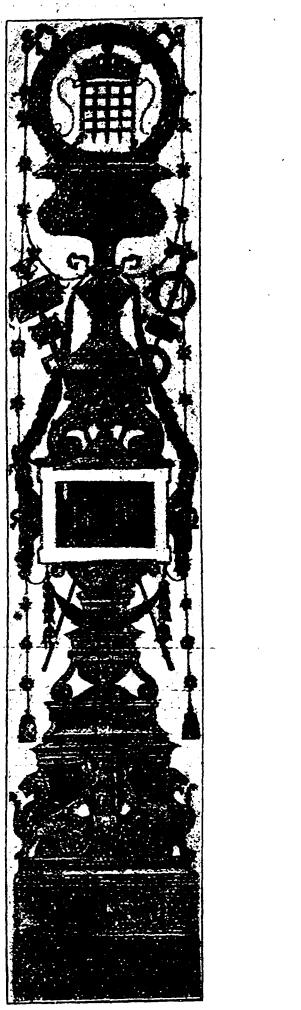
*Finsbury, Central.*—That an order be issued to Messrs. Vigers & Co., sanctioning the formation or laying out of a new street for carriage traffic to lead out of Alexandra Park-road, Muswell Hill, Clerkenwell (detached), (for the London and Middlesex Freehold Estates Company, Limited). That the name Curzon-road be approved for the new street.—Agreed.

### *Working-class Dwellings.*

*Islington, North.*—That the Council do make an order as follows—Whereas Mr. Alfred Tosh . . . under the provisions of Section 42 of the London Building Act, 1894, delivered, on behalf of Mr. D. Devant, at the County Hall, plans of four blocks of intended dwelling-houses to be inhabited by persons of the working class, and proposed to be erected, not abutting upon a street, on a site at the rear of houses on the east side of St. John's-road, Upper Holloway, Islington . . . Now the Council does by this order disapprove of, and refuse to sanction, the said plans.—Agreed.

◆

ALTAR TABLE, ST. ANDREW'S CHURCH, LINCOLN. —An altar table of oak has just been placed in St. Andrew's Church, Lincoln. The work was carried out by Mr. S. C. Basker, the carving having been executed by Mr. A. J. Tuttell. The architect was Mr. Pratt, of Nottingham.



*Arabesque Decoration, Princes Restaurant.— By Mr. H. C. Brewer.*

## ARABESQUE DECORATION.

THIS small illustration represents one of the arabesque panels painted by Mr. H. C. Brewer at the Princes Restaurant. As we are giving in our plates of this week Mr. Brewer's decorations for a theatre, we add this as another specimen of his work.

◆

# Illustrations.

## DECORATIONS OF THE NEW PALACE THEATRE, PLYMOUTH.

ALTHOUGH these interesting examples of modern theatre decoration were quite recently executed, they are now no more, the new Palace Theatre at Plymouth, designed by Messrs. Wimperis and Arber, in which they were painted, having been destroyed by fire in December last. As the designs represent a very meritorious effort to give special point and interest to the decorations of a theatre, in connexion with the associations of the locality, we are glad to have an opportunity of preserving a record of them in our illustration pages.

The artist is Mr. H. C. Brewer, the son of Mr. H. W. Brewer, whose architectural drawings and conceptions are so well known to our readers. The following is Mr. Brewer's description of the work :—

"These decorations were carried out to attract a local audience, whose interest was mainly connected with the British Navy. The four larger panels in the dome represent the chief battles of the Navy. Facing the audience was 'The Destruction of the Spanish Armada;' on either side of it 'Lord Howe's Victory of the First of June' and 'The Battle of Trafalgar;' and 'Blake's Victory over Van Tromp' filled the fourth panel. The smaller panels represented '*The Great Harry*,' first great battleship of the Navy; '*The Victory*,' most famous ship of the Navy; '*The Majestic*,' one of the latest ironclads; and '*The Sancta Maria*,' the ship in which Columbus discovered America.

The frieze above the proscenium arch repre-

*Finsbury Pupil Teachers' Centre. Plan.*

sents Queen Elizabeth knighting Drake, surrounded by the chief military and literary men of the period. Two Elizabethan ships filled the panels at either end of the frieze. These panels were carefully studied from an antiquarian point of view. They were executed on canvas prepared with an absorbent ground of zinc white, and were painted with a medium composed of copal, spirit, and wax. This medium gave them an absolutely smooth surface on which the dust could not settle, and which was capable of being repeatedly washed. The canvas was fixed on a surface of white lead mixed with varnish, which protected it from any injurious effect of the plaster. It had to be fixed immediately the plaster was set.

The effect of the dome was greatly added to by the absence of the usual centre chandelier, the light being obtained by a row of electric lights placed on the ledge of the cornice, thus brilliantly lighting the dome without the source of light being visible."

## THE INSTITUTION OF MECHANICAL ENGINEERS.

THE house has been about two years in building. The façade, as illustrated, overlooks St. James's Park, towards the Horse Guards' Parade, the Foreign Office, and new Admiralty Buildings. Brown Portland stone and Midland red pressed brick facings are used on the front. The foundations stand in running water, about 22 ft. below the pavement, and some trouble was experienced in laying them; the concrete walls are 7 ft. thick, and the basement floor is laid "table-top" fashion on the top, like an inverted tank, circulation of the water throughout being provided for with terra-cotta pipes laid in the concrete walls.

The interior is treated generally with Hungarian oak and fibrous plaster enriched ceilings. The special features of the building are the lecture hall, with its ceiling hung clear of the walls for acoustic purposes, and the false floor which can be arranged in tiers for lectures or in one level. The tea-room, for which a basement floor is utilised, is treated with light and rich-coloured marbles, Mexican oynx-cippolino, antique Sienna and white statuary. The library, shown in the illustration, has light oak bookcases of Elizabethan style. The "plenum" system is adopted for the ventilation of the principal rooms. The building is lit by electricity, the same agent being used for working lifts, clocks, ventilation fans, and power for working exhibition models.

Messrs. Lawrance & Sons, of Wharf-road, City-road, N., were the contractors; Mr. William Winteringham being the clerk of works; Messrs. Patteson, of Manchester, were the marble contractors; and Messrs. Hardman & Powell, of Birmingham and London, the firm carrying out the ornamental iron and metal finishings generally. The fibrous plaster ceilings are by Mr. Gilbert Seale, of Camberwell, and Messrs. Jackson & Sons, of Rathbone-place. Mr. Middleton, of Westminster, carried out the electric installation under Mr. Edward de Segundo, consulting electrical expert. The lifts are by the Otis Elevator Company, of London.

The architect is Mr. Basil Slade.

## FINSBURY PUPIL TEACHERS' CENTRE.

THE Finsbury Pupil Teachers' Centre, to be erected in the Offord-road, Islington, N., will provide accommodation for 312 students, including eight class-rooms, central examination hall, gymnasium with dressing-rooms, drawing class-room, modelling room, chemical and physical laboratories with dark room and chemical stores, lecture room, teachers' private rooms, lavatories, stock and cloak rooms.

The walls will be faced externally with red bricks and buff terra-cotta dressings, and roofed with deep strawberry-coloured Broseley tiles.

The architect is Mr. T. J. Bailey, Architect to the School Board for London.

## AN OLD FOLKS' HOME, HITCHIN, HERTS.

THIS building has been erected by Mr. F. W. Phillips, of Hitchin, for the accommodation of certain widows and old men. It contains eight sets of rooms arranged on two floors. The living-rooms have each a cupboard scullery, fitted with shelves and racks, and ventilated by its own window; and over the ceilings of these sculleries end light and ventilation is obtained for the corridors.

A washhouse, water-closets, and coal-sheds are provided in the drying-ground and garden at the back of the site, approached by a length of covered way.

The walling is of brick, faced with roughcast from the ground-floor sills upwards. Below these is a red brick plinth, built hollow. The projecting gable ends are finished with lime plastering, arranged in panels filled with scratched patterns, as seen in old cottages in the neighbourhood. The builders were Messrs. Matthew Foster & Co., of Hitchin, and the architect Mr. Walter Millard. The drawing is by Mr. F. L. Griggs.

## NEW POST-OFFICE, BROADWAY, WORCESTERSHIRE.

AN endeavour has been made to keep this post-office, which is now being built in the main street of Broadway, as quiet and unobtrusive as possible and in harmony with the rest of the buildings in this unique country village. No attempt has been made to impart an official character to it, or to emphasise its purpose in any way.

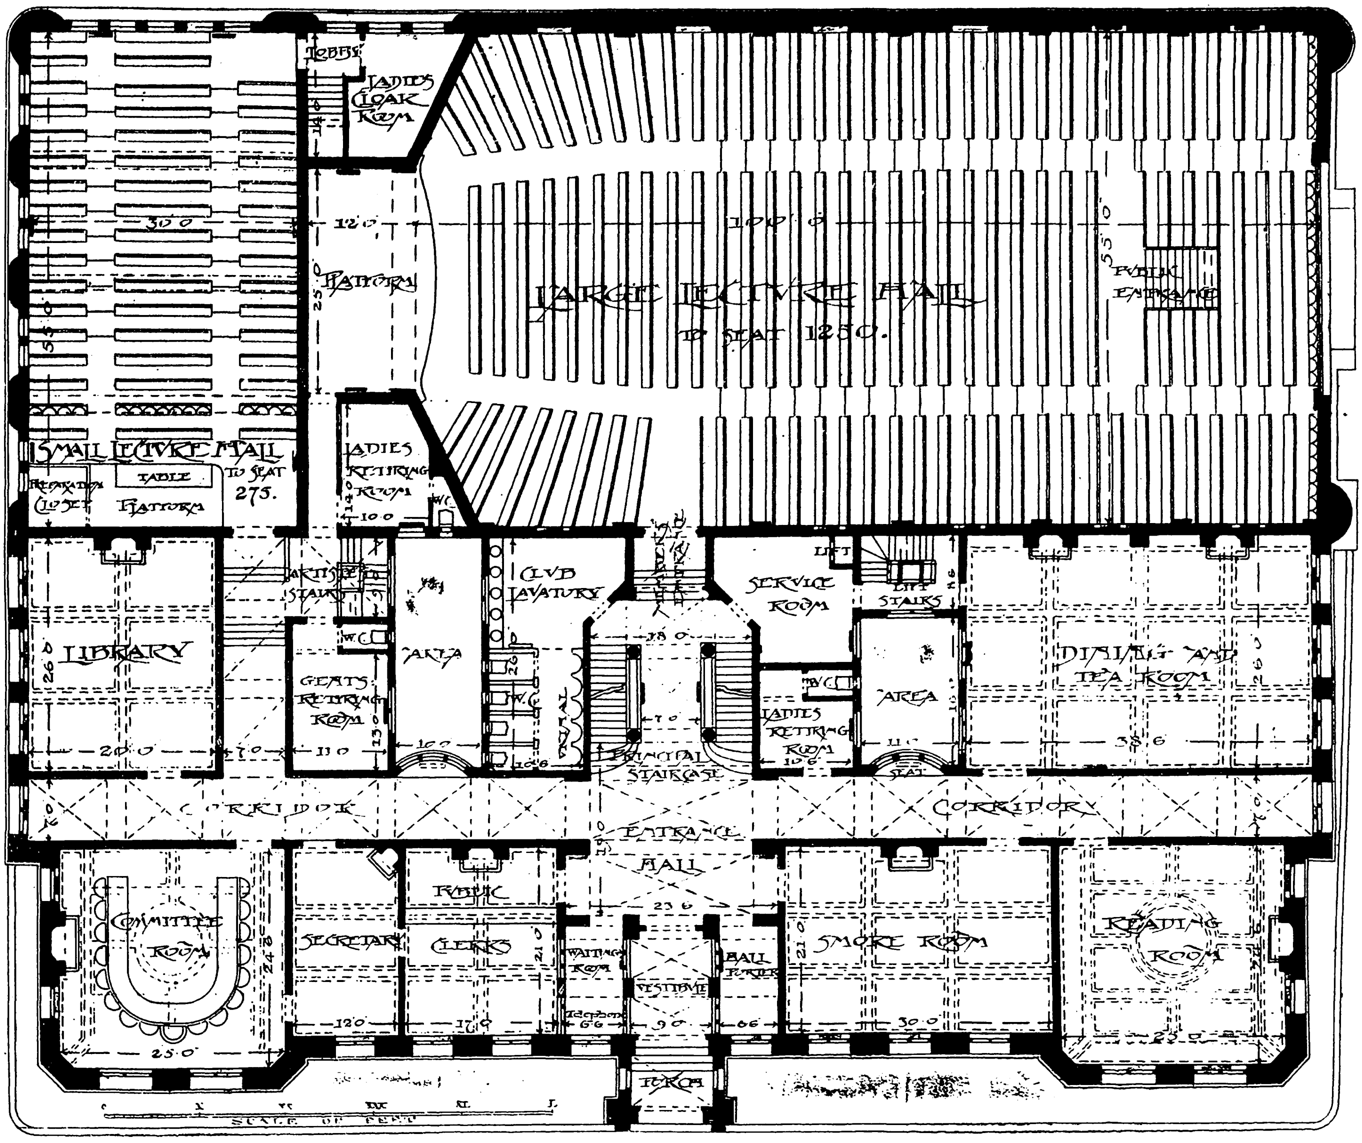
The architects are Messrs. E. Guy Dawber & Whitwell, of London, and the builders, Messrs. Espley & Co., of Evesham.

The drawing is exhibited at the Royal Academy.

## COMPETITION DESIGN FOR ROYAL INSTITUTION, LIVERPOOL.

THE Liverpool Royal Institution is the home of a number of learned societies, in which they hold various meetings and classes, and in addition the new scheme will include club accommodation for the various members.

The most important feature of this competition was to provide for a large lecture hall, to seat 1,250, by only pulling down part of the existing premises, and leaving the remainder intact for present purposes. The plan shows the arrangement of the ground floor proposed in this design. On the first floor are five meeting rooms for various scientific societies, arranged *en suite* for receptions, and two lecture rooms and a music room for practice,



*Design for Liverpool Royal Institution. Plan.*

detached by an annexe; art galleries and museum being arranged on the second floor, which also contains caretaker's quarters. The cloak-rooms and entrance to large lecture hall are arranged under part of the lecture hall, and are approached from Seel-street. Entrances are also provided from the Institute itself, and from Parr-street for artistes, &c., on musical occasions. An emergency exit is arranged into Back Colquit-street.

In the basement is an examination hall and six class-rooms, well lighted by taking advantage of the fall of the ground.

The requirements issued by the Committee were extremely vague, and consequently the plans submitted varied to a considerable extent.

The author of this design, which obtained the second premium in the competition, is Mr. R. W. Bedingfield, of Leicester.

NEW CHAPEL, NETHERFIELD, NOTTINGHAMSHIRE.—The jubilee year of the Notts Baptist Preachers' Association was signalised on the 22nd ult. by the laying of a memorial stone and six foundation stones in connexion with the new chapel which is being erected at Netherfield at a cost of 1,200*l.* Accommodation is being provided for about 400 worshippers. The length of the structure is 55 ft. and the width 41 ft. Mr. W. H. Higginbottom, of Nottingham, is the architect, and Mr. J. Lewin, of Netherfield, the builder.

### ARCHITECTURAL HYGIENE.

XX.—VENTILATION AND HEATING SCHEMES.

*a. Cottages.*
*b. Houses.*
*c. Churches.*
*d. Schools (class-rooms).*
*e. Hall (open timbered roof).*
*f. Large Hall (with flat ceiling).*
*g. Hospitals.*
*h. Theatres.*
*j. Picture Galleries.*
*k. A Chapel with gallery round three sides.*
*l. A Billiard-room.*

(*a*) COTTAGES.

IT is notorious that people who live an open air life are content to live in very stuffy rooms. The ordinary cottager is well known to have these views, and even if architects provide air bricks or tubes, they are immediately blocked up. This is really very natural because small rooms are specially difficult to ventilate without draught, and, of course, expense would prevent any scheme of ventilation other than a natural one being employed. The open fireplace then is, as a rule, the sole agent, but occasionally a ventilating fireplace of the Galton pattern (as already described and illustrated) is employed, or if not, then a Teale fireplace with economiser grate, may be used, as less draughts are likely to occur with these.

The upper rooms may be kept at an equable temperature, by the use of ventilating fanlights over the internal doors; the chimney acting as an extract.

(*b*) HOUSES.

So much depends upon the size of the house and the money which the owner can afford to expend on ventilation that it is difficult to lay down more than general rules.

Firstly, as to the *Hall and Staircase.*—An improperly warmed and ventilated staircase is the cause of draughts and chill.

The best way to effect this is by means of hot-water coils placed so that the incoming air from the front door may be warmed, and so that the large amount of air in a hall and staircase may not be at a much lower temperature than the air of the rooms themselves. Fresh warmed air can be introduced over this coil. By properly heating this portion of the house, all the rooms abutting thereon are rendered more habitable, especially in cold weather, as the warmed air enters them and finds an exit in their fireplaces.

Again, when sitting-room doors are opened a cold blast of air does not penetrate and cause colds and coughs. The great secret of a warmed and ventilated house lies in thoroughly attending to the hall and staircase, and no system will be found complete until this is taken in hand. An exit for foul air should be provided wherever possible into an air flue in the upper part of house, or by means of a lantern light fitted with extract coil. In this case, it is best to create an up current and thus prevent a down draught by placing a coil of water pipes as a lining to the lantern.

The air in the hall and living rooms should be as nearly as possible of the same temperature, if draughts are to be prevented, and to keep the air of the house pure and sweet both will intermingle with advantage. If warmed air is introduced into the hall, and fanlights are arranged above the doors of the rooms, a continual stream of warmed fresh air is supplied to the house.

As regards *kitchen, scullery, and offices,* and rooms containing sanitary fittings, and cellars, however, we should have another object in view, and that is to disconnect these as much as possible from the living portion.

We have endeavoured to show this in our article on "planning."

As to the kitchen, if possible, cross ventilation should be provided, so that the fumes may be dispersed as soon as possible, and a cross ventilating corridor should always be so planned that kitchen smells may be prevented from entering the living part of the house.

As to the lavatories and water-closets an ideal arrangement is that which obtains in hospitals. This is, however, rarely done, and it is doubtful if it is always necessary. The usual way is to place the lavatory, which may also form a cloak-room, so as to be entered from the hall, and this in itself forms a disconnecting lobby; it should be provided, if possible, with two windows, so that "through" or "cross" ventilation may be obtained, and therefore effective disconnexion of the water-closet from the main portion of the house. In order to ventilate the water-closet itself, louvres, or a grating, may be placed in the lower part of the door connecting it with the lavatory, so that air may be allowed to enter from the lobby and escape through the water-closet window.

*Cellars* should be cut off from the living portion of the house by cross ventilating lobbies. This is necessary in order that the damp, cold air may not be drawn into the house, and that the dust from coal-cellars and underground passages, the fumes from water-closets, and decaying matter from dust-bins and refuse may not be drawn up by the warm house air.

*Bedrooms.*—Every bedroom should, of course, have a fireplace, and the inlet to the flue should always be kept open, so that a current of air may always be travelling up the flue.

The old form of grate, with a register which can be shut down should be avoided, as ignorant people seem very fond of shutting this, in which case the bedroom becomes a mere box without outlet. A bedroom in which the register is pulled down is almost certain to produce a headache by the morning.

People who desire to be healthy have their windows open an inch or so all the year round; but if this is objected to, a ventilating grating over the doorway should be provided, so that the fresh air admitted to the hall, after being warmed by the radiator, can pass through the bedrooms and so up the fireplaces.

### (*c*) CHURCHES.

In this class of building 500 ft. per hour per person may be taken as a standard. The motive power for the extract may be produced either by a shaft in the tower, which may be heated by a coke furnace or gas, or by a fan worked by a gas engine. The inlet of fresh air may be introduced at different points over hot-water radiators, or by air which passes through a chamber filled with hot water pipes and delivered to various points in the church. Hot-water piping, either raised above the floor on the outside walls or in channels below the floor when placed in aisles, are also used. Extracts can be taken into the roof at various points, and either led into the tower shaft, or aided by gas or a hot-water or steam coil to find its exit in an extract ventilator.

In lofty churches with clearstories the windows may be in two thicknesses of glass, and very often a hot water flow and return can be carried round at the clearstory level, which will warm the air at this cold part and prevent the down draught, which is so objectionable.

### (*d*) SCHOOLS.

This type of building is one of the most important as one of the most difficult to ventilate.

Important, because if properly ventilated, it prevents the spread of infectious diseases and increases the working power of the students and teachers, and keeps them in better health and spirits.

Difficult, because of the number and different sizes of the class-rooms, the number of students in each, the varying length of time for which each is used. The various positions of the different class-rooms must be also taken into account, as, for instance, a room with a southern temperature requires less heat than one exposed to a north-east aspect.

The system, therefore, that appeals to us is one in which each room can be independently kept at a required temperature. The idiosyncrasies of masters has also to be taken into account; these should only be allowed play within a certain limit.

The Education Department requires fresh-air inlets equal to 2½ square inches per scholar, and outlets equal to 2 square inches per scholar, in addition to the fireplace chimney.

In Mr. Robins's work on "Technical School and College Building," a careful survey is made of the ventilation arrangements of recent schools.

The three methods are:—

1. Supply from one large heating chamber.
2. Supply from separate heating chambers.
3. Supply from cased coils in the rooms.

Whichever system is adopted, a separate heating surface giving radiation to each room should be adopted.

An example of a school recently erected is given as an illustration of heating from one chamber by means of hot-water pipes and radiators, and an extract flue heated by carrying up the iron smoke pipe from the boiler in a brick flue, which thus is heated to act as an exhaust for the vitiated air of the class-room, which is led into it by brick ducts.

In this case (figs. 248 and 249) the class-rooms are warmed by means of one ventilating radiator fixed in each class-room over a 2-in. cast-iron circulating pipe as shown in the drawing. Fresh air is admitted to these radiators by two 9 in. by 6 in. cast-iron galvanised fresh-air inlet gratings, with regulating gratings at the back of each radiator, so that after being warmed it enters the room. Each radiator is fixed above the circulating main and fitted with regulating valve and unions, so that each class-room can be regulated or shut off as required by the master in charge, with the exception of the circulating-pipe at the skirting level. The passages are warmed in a similar way. The heating apparatus is worked from a boiler fixed in the basement where shown on plan. As to the ventilation, it was considered necessary to change the air of the class-rooms three times an hour. The up-cast flue-pipe from the boiler acts as the extracting power. This is enclosed in a brick air-trunk 2 ft. 6 in. square, and the vitiated air from the class-rooms is introduced into this space round the flue-pipe, and the up-current is started by the heated surface of the flue-pipe. The exit of foul air from the class-rooms is led by means of a cast-iron extraction-grating at the high-level and of different sectional areas to each class, because of its length from the up-cast flue. The foul air descends by brick flues in the corner of each room into a brick channel formed into the floor of the passage, 2 ft. 6 in. by 2 ft. in the clear. This vitiated air-channel is connected with the up-cast flue as shown.

In the summer, when the heating apparatus will not be working, an open-fire coke stove placed next to the boiler in the basement and with flue taken into the cast-iron flue pipe, is kept going, so that the vitiated air trunk is always heated and the attraction formed in the ventilating flues winter and summer.

As to the practical working, one of the end class-rooms is taken, as being the most difficult to heat:—

*Heating.*

Cubic contents of class-room 24 ft. × 17 ft. × 12 ft. = 4,896 cubic feet.

Change air three times per hour = 4,896 × 3 = 14,688 cubic feet.

1 heat unit will raise 55 cubic feet one degree $\frac{14,688}{55} = 267$ heat units.

*Glass Surface.*

Two windows about 5 ft. × 3 ft. 11 in. = say, 39 square feet.

1 square foot of glass requires $\frac{92}{100}$ heat units $= 39 \times \frac{92}{100} = 36$.

*Wall Surface* (outside only).

| | |
|---|---|
| One side wall 24 ft. × 12 ft. = | 288 square feet. |
| One end wall 17 ft. × 12 ft. = | 204 „ |
| | 453 |

1 square foot of wall surface requires $\frac{3}{10}$ heat unit.

$$\therefore 453 \times \frac{3}{10} = \frac{136}{439}$$

∴ 439 heat units required per degree difference 60 deg. internally when at 32 deg. externally = difference = 28 deg.

∴ 439 × 28 = 12,292 heat units.

1 ft. super of hot water surface gives off 175 heat units.

∴ 12,292 ÷ 175 = 70 ft. super. of hot-water surface required.

| | |
|---|---|
| One radiator | = 50 ft. super. |
| 42 ft. of 2 in. pipe | = 21 ft. super. |
| Total feet super of hot-water surface in room | 71 ft. super. |

*Ventilation.*—Cubic contents 4,896 × 3 times per hour = 14,688.

Velocity of extract = 6 ft. per second = 21,600 ft. per hour; 14,688 ÷ 21,600 = ·68 square feet outlet required (·68 of square foot = 108 square inches).

Class-room nearest to the shaft has outlet 12 in. × 9 in.

Class-room furthest from the shaft has outlet 18 in. × 12 in.

Amount of air per hour for each pupil $= \frac{14,688}{30} = 489$ cubic feet.

Thirty pupils would be the limit that should be allowed in the room, as a rule not more than twenty to twenty-five should be present.

Messrs. Rosser & Russell, of London, were the engineers who carried out this scheme.

### (*e*) A LARGE HALL.

Fig. 250 is an example of a large hall for public meetings, &c. It is 83 ft. long by 42 ft. wide, and is covered with an open-timber roof, the tie-beam of which is 20 ft. from the floor (fig. 251).

The heating was effected by a boiler of sufficient size in the basement. From this boiler a 3 in. flow and return main was carried to serve the hall and staircases, as shown on the plans. It is carried round the hall at the floor level. The hall itself is warmed with powerful hot-water ventilating radiators, each 46 in. long, 8¾ in. wide, and 37 in. high, fitted with connexions to the flow and return pipe, so as to be entirely under control. The ventilation is effected by means of 18 in. by 12 in. fresh-air inlets placed behind the ventilating radiators. External air bricks and internal hit-and-miss regulating gratings being supplied for each, the extract being by a powerful exhaust ventilator fitted at the ridge level.

The following are the calculations:—

*Heating.*

Cubic contents 83 ft. × 42 ft. × 30 ft. = 104,580 cubic feet.

Change air once per hour.

1 heat unit will raise 55 cubic feet 1 deg.

| | Heat Units. |
|---|---|
| ∴ 104,580 ÷ 55 =… | 1,902 |

| *Glass.* | sq. ft. |
|---|---|
| Ten windows 4 ft. 6 in. wide and 8 ft. high ..................... | 360 |
| Two windows 14 ft. wide and 14 ft. high ........................ | 392 |
| | 752 |

1 square foot of glass requires $\frac{92}{100}$ heat units.

$$752 \times \frac{92}{100} = \ldots \quad 692$$

*Wall Surface and Roof.*

| | |
|---|---|
| Sides 83 × 50 × 2 = | 8,300 |
| Ends 42 × 30 × 2 = | 2,500 |
| | 10,820 |
| Deduct glass | 752 |
| | 10,068 |

1 square foot requires $\frac{3}{10}$ heat units.

$$10,068 \times \frac{3}{10} = \ldots \quad 3,018$$

5,612

5,612 heat units required per each degree of internal and external difference: 55 deg. internally when 30 deg. externally = 25 deg. difference.

5,612 × 25 = 140,300

1 ft. super H.W. surface gives off 175 heat units.

140,300 ÷ 175 = 800 sq. ft. heating surface.

188 ft. run 3 in. pipe = 165 ft. sup.

6 radiators at 106 ft. = 636

801 sq. ft. of heating surface.

*Ventilation:*

Cubic contents, 104,580.

Velocity of extract 6 ft. per second = 21,600 per hour.

104,580 ÷ 21,600 = 5 sq. ft.

One extract ventilator 32 in. diameter (extract) = 5·5 sq. ft.

Six 18 in. × 12 in. at ⅔ of area = 6 sq. ft (inlet).

### (*f*) HALL (WITH FLAT PLASTER CEILING).
*(Figs. 252 and 253.)*

This was a case in which the hall had been built for some time without being heated in any way; in consequence, air had to be admitted cold, and the consequence was that this descended on to the heads of the defenceless occupants to such an extent that at last they determined to adopt a proper scheme.

Ventilating radiators were placed in recesses under the windows and behind the oak panelling. Fresh air was admitted to these radiators by inlet gratings and, after being warmed, was admitted into the hall at a height of 6 ft. By this means the down draught from the big windows was prevented. The panelling in front of the radiators was lined with sheet-iron and asbestic so as to prevent the woodwork being affected by the heat. The extraction of vitiated air was provided for by means of the three sun-burners which had ventilating tubes taken to the outer air and up which a strong current was thus always passing. Fig 252 shows the plan and fig. 253 a detail of the radiators enclosed in the panelling.

### (*g*) HOSPITALS.

The subject of hospital ventilation is such a large one, and the various types of hospital so many, that we can hardly do more than touch upon it here. At least 3,000 cubic feet per head per hour is quite the minimum amount of air which should be allowed, and the inlets and outlets may be provided in any of the ways already referred to. During the last few years mechanical means have been employed for the purpose of securing ventilation. One of the largest and most complete installations on the "plenum" principle is that carried out at the Birmingham General Hospital (Mr. Henman, F.R.I.B.A., architect), in which no fireplaces are used, the air being forced in by fans, cleansed, and brought to a proper hygrostatic condition by filtering through moistened screens, warmed when required by means of steam coils, and propelled through the wards into extract flues, whence it passes into the open through flapped and louvred openings, constructed so that the varying movements of the outer atmosphere can exert no influence upon the outflow.

The illustration (fig. 254), from a drawing kindly supplied by Mr. Wm. Henman, shows the application of the system, which the following remarks will make clear. The air is sucked in from windows in the basement (carefully selected so as to be out of the way of contaminated air) by a fan, passing first through a screen of strained cocoanut fibre, kept automatically wetted every quarter of an hour. The air is then carried through a series of horizontal steam-pipes, heated to the required temperature, then through the fan and into the basement tunnels. These tunnels (or "ducts" as they are called) start in sectional area 11 ft. by 8 ft., and only in a few cases are they so little as 3 ft. in width at the extreme ends in a few branch ducts. From these ducts are taken the vertical ducts to the rooms above. At the mouth of each of these vertical ducts is a *separate* steam radiator to give extra warmth if required for different departments, in excess of that supplied by the main collection of steam coils.

In the *large wards*, the air is admitted at the window boards behind a vertical glass screen, 18 in. high, in order to screen off direct draught and direct the air upwards; it is extracted near the floor in order to ensure circulation. However, it is only in the large wards, and there only partially for constructive reasons, that the air is admitted in front of the windows, elsewhere it is through openings at a height of about two-thirds of the respective rooms. The foul air is not "extracted" at all, it is simply forced out by the continuous forcing in of fresh air, the outlets being near the floor level.

The movement of the air being well under control, the wards can be kept perfectly fresh during the whole of the twenty-four hours; whereas in cases where natural systems are adopted, the wards may, perhaps, be kept fairly fresh during the day, but become particularly offensive at night. The ventilation of the hospital is divided into eight separate systems, worked by eight fans, but in case of the breakdown of a fan, two systems can be coupled and worked by one fan.

In smaller buildings, such as cottage hospitals, &c., the method of ventilation in military hospitals may be adopted. The room may be warmed by a Galton's ventilating grate, which forms an outlet and inlet.

Further, Sherringham's ventilators are provided as inlets; one square inch being allowed for each 60 cubic ft.

An additional outlet, consisting of 12 square inches to each man, is carried from the ceiling level to 6 ft. above the roof.

### (*h*) THEATRES.

The ventilation of theatres requires, as a rule, the advice of an expert. It is essential that all draughts should be carefully avoided, and for this reason the "plenum" method seems desirable, the air being admitted into a basement chamber, passed over hot-water and steam pipes, screened and moistened by means of sprays of water, and so introduced by numerous openings as to thoroughly reach every part of the house. The use of electricity has facilitated matters by decreasing the amount of air which was formerly necessary to supply the old gas burners.

The Vienna Opera House is generally quoted as a perfect example. In this case the "plenum" and "vacuum" methods are employed, there being two fans, one for propulsion and the other for exhaust. The air is admitted through the floor and risers of seats.

The Metropolitan Opera House, New York, is ventilated on the "plenum" system only. During the day the building is highly heated so that the walls may be thoroughly warmed. Before the performance begins the temperature is lowered to the required point, and as the performance progresses and the heat from the audience is felt, the temperature is gradually lowered.

The older theatres in London are many of them most inefficiently ventilated, and it is high time that efficient ventilation is insisted upon before licences are granted. All public buildings have to be provided with a proper water supply, which is properly filtered by the companies before being delivered, and it is difficult to understand why a sufficient supply of pure fresh air, warmed to the proper temperature should not also be provided.

### (*j*) PICTURE GALLERIES OR SCHOOLS OF ART.

In cases of this sort in which a large amount of glass in a skylight or lantern occurs in the top part of the room; difficulty is often experienced because of the down draught which comes from the cold surface of the glass.

Powerful gas lights with ventilating tubes may be taken through the roof to induce an upcurrent, and inlet ventilators may be introduced 6 ft. from the floor in the four corners of the room.

### (*k*) A CHAPEL WITH GALLERIES.

This is given as the fixed seats required a somewhat different arrangement. The chapel itself is warmed by means of two rows of 2 in. pipe each side, and two rows of 3 in. pipes in a prepared trench, covered with cast-iron floor grating. Radiators are fixed near the entrance doors, so that the incoming air may be warmed. In order to prevent a down draught from the large amount of cold air in the upper part of hall, the gallery is heated by two rows of 2 in. pipes on each side of gallery. As to the ventilation, fresh air is admitted behind the radiators on ground floor, and into the trenches in the central part of chapel by means of air channels formed of glazed drain pipes which lead in an upward direction in the channel mentioned above. The extraction of foul air is effected by means of three gas sun-burners suspended from the roof with ventilating shafts leading into a galvanised iron vitiated air-trunk, taken into a central galvanised iron box on the top of which an extract ventilator is fixed, communicating with the outer air. Figs. 255, 256 show the ground floor and basement plans respectively and fig. 257 shows a section throughout.

### (*l*) A BILLIARD-ROOM.

A billiard-room is very often difficult to ventilate because of the large amount of glass in the lantern which is necessary for lighting the table, and the enormous quantity of gas which is necessary for lighting. The first thing which should be done wherever possible is to substitute electricity for gas; this will simplify matters considerably. In order to prevent a down-draught from the cold air round the glass a "lay-light" or horizontal glass ceiling may be placed below the lantern, and the space thus formed warmed by a coil of hot-water pipes, so as to cause an up current, which can be taken through an ordinary extract ventilator. Fresh air should, of course, be made to enter by means of ventilating radiators from, if possible, the four corners of the room. If hot-water heating is not desired, a ventilating grate may be used, the lay light made air tight, several Sherringham inlets placed in the walls, and the extract obtained by a special foul-air flue in the chimney-breast, with possibly a "pilot light" or gas jet to accelerate the current.

## *OBITUARY.*

**Rosa Bonheur.**—This great painter, whose talents have raised her to the highest position among contemporary artists, and such as no other lady artist has hitherto attained, died on Thursday May 25, in the seventy-seventh year of her age, at the country retreat which she had latterly inhabited at By, near Fontainebleau. She is the last member of a remarkable family who were entirely devoted to art. Her father, Raymond Bonheur, a distinguished painter, quitted Bordeaux in 1829 to establish himself in Paris; his four children, Rosa, Auguste, Isidore, and Juliette (who became Madame Peyrol) all became artists in turn, and the son of Madame Peyrol is also an animal sculptor of recognised talent. Raymond Bonheur gave every encouragement and care to the artistic training of his eldest daughter, and at the age of eighteen she exhibited her first picture in the Salon of 1840. In 1848 she obtained the "Première Médaille" for her work entitled "Labourage Nivernais," now in the Luxembourg. Among her subsequently exhibited works were "Animaux dans un Pâturage," "Le Cheval à Vendre," "Chevaux Sortant de l'Abreuvoir," "Chevaux dans un Prairie," "Vaches au Pâturage," "La Rencontre," "Le Labourage," "Un Troupeau Cheminant," "Etude d'Etalons," "Etude de Chien Courant," &c. In 1853 she obained a great success with the well-known "Marché aux Chevaux" ("The Horse Fair"), now in the National Gallery. In 1855 she sent to the Universal Exhibition her "Fenaison au Auvergne," and subsequently exhibited "Moutons au bord de la Mer," "Un Berger Béarnais," "Bourriquaires Aragonais," "Des Cerfs," "Une razzia en Ecosse," "Chevreuils au Repos," and "Berger Ecossais." The collective exhibition of these works at the Universal Exhibition of 1867 brought her to the height of a reputation which was as high in foreign countries as in her own; so much so that in the war of 1870 her cottage at By was scrupulously respected and spared by the invading army. Her brilliant success even overcame the violent prejudices then existing against the conferring of official honours on women; in 1869 the Empress Eugénie herself decorated Rosa Bonheur with the cross of the Legion of Honour; a short time afterwards she was elected a member of the Institute of Antwerp, and in 1894 was created an "Officier" in the Legion of Honour—the only French woman who has ever received such a distinction. After this she abstained for a good many years from exhibiting at the Salon, but sent one work to the Salon of the present year; and when it was proposed to present her with the "Medaille d'Honneur" of the year, she declined it, in a letter of great dignity and charm, on account of the comparative unimportance of her work. She was in fact right—the picture was not, for her, an important one, and the proposal to award the medal was probably intended rather as a recognition of her genius than of the special picture in question; but this does not detract from the fine feeling she displayed in declining the honour. At the time of her rather sudden death she was still working hard at her art, in her peaceful retreat at By, among her much-loved animals, and venerated by all who knew her for her dignity of character and her inexhaustible charity and benevolence.

**Mr. Abraham Graham.**—The death has just occurred, at the age of sixty-six years, of Mr. Abraham Graham, of Bankfield House, Huddersfield. The deceased was head of the firm of contractors, Messrs. Abraham Graham & Sons, whose business is now carried on at Longroyd Bridge.

## *GENERAL BUILDING NEWS.*

**Proposed Extension of the Municipal Buildings, Dorchester.**—It is proposed to enlarge the municipal buildings at Dorchester by the addition of buildings adjoining the present market-house. The additions will be used for municipal and technical instruction purposes. An inquiry has just been held by Mr. Percy Boulnois into an application of the Town Council for permission to borrow 1,900*l*. in order to carry out the scheme. Mr. G. J. Hunt is the Borough Surveyor.

**Addition to Norwich Liberal Club.**—A new billiard-room has been added to the Norwich Liberal Club rooms on the Walk. The new room, which is situated at the rear of the club premises, has been erected by Mr. John Downing, Mr. Edward Boardman being the architect.

Church, Walton, Liverpool.—On the 25th ult. the memorial stone was laid of the new church of St. Luke the Evangelist, Walton-on-the-Hill. When completed the church will provide 564 sittings. The building will be of red brick. The architect is Mr. J. Francis Doyle, and the contract is being carried out by the firm of Mr. Samuel Webster.

St. Columba's Church, Bradford.—The foundation stone of the new church of St. Columba, Bradford, has just been laid. Messrs. T. H. & F. Healey, architects, of Bradford, have prepared the plans for the new church. It will consist of nave and chancel, of one height throughout, and of north and south aisles, with north and south quasi-transepts. There will be a chancel aisle or chapel on the north side, and organ chamber and vestries on the south side. Advantage will be taken of the fall of the ground to place choir vestries and parish rooms at the east end of the church, which will be above the ground, the east gable rising to a height of about 60 ft. above the street level. Entrance to the church will be gained by a porch to the west end, and there will also be an entrance at the north transept. A bell turret, which will serve at its basement as an entrance to the parish-rooms, will be the only feature of the church taking the place of the usual tower. The windows generally will be of Early English lancet type, but in the chapel and transepts a rather earlier form of traceried window will be used. The nave will comprise six bays and the chancel three. The columns and arches of the nave arcade will be fairly elevated, and the clear-story above will have coupled lancet windows. The north arcade of the chancel will be subdivided into trefoil-headed arches, and the blank portion above will be left for statuary. The building will be erected both internally and externally of stone from Ringby Quarries, near Halifax. The sittings will provide accommodation for about 700 worshippers. Mr. William Farnish is executing the mason's work, but the distribution of the other contracts has not yet been decided upon.—*Bradford Observer.*

Primitive Methodist Chapel, Loddon, Norfolk.—The memorial stone has just been laid at Loddon of a Primitive Methodist chapel. The building is designed to seat about 200 persons, and will cost close upon 1,000*l*. It is being erected by Messrs. Chaston & Grimson, of Loddon, from plans by Messrs. Kerridge & Sons, of Wisbech.

Presbyterian Church, Ashington. — The memorial stone of the new Presbyterian church at Ashington has just been laid. The new church, which has been designed by Mr. C. S. Errington, of Newcastle, in the Early English style, will consist of nave and transepts, and is being built of local bricks and Commondale terra-cotta dressings. The seating accommodation will be for 300, and in the hall adjoining there are seats for 150 and vestry accommodation. The building is to be lighted by gas, and heated by apparatus supplied by Messrs. Emley & Sons, of Newcastle.

Restoration of Anwick Church, Lincoln.—The Chancellor has decreed a faculty for the restoration in three stages of St. Edith's Church, Anwick, Sleaford. The first instalment of the work will be the extension of the chancel to its original length and the raising of the roof to its original height. The contract of Mr. Frank Pattinson, of Ruskington, has been accepted for this portion of the work, which will be proceeded with at once. Plans for the restoration have been prepared by Messrs. Brewill & Baily, Nottingham and Newark.

New Church, Hetton, Durham. — Two foundation stones were laid on the 24th ult. in connexion with the building of a new church at Hetton-le-Hole. Mr. Piper, of Newcastle, is the architect, and Mr. William Sparrow, of Hetton, the contractor, for the building.

Wesleyan Chapel, Rothwell, Northamptonshire.—The foundation stones have just been laid of the new Wesleyan Chapel at Rothwell. Messrs. Gotch & Saunders, of Kettering, were the architects, and the contract was placed in the hands of Mr. F. Barlow, J.P. The new chapel will have a frontage of Weldon stone.

Wesleyan Methodist Church, Sileby, Leicestershire.—The memorial stones were laid recently of a new Wesleyan Sunday-school at Sileby. The building, which is being erected by Mr. Sleath, of Rothley, from plans by Mr. A. E. Sawday, of Leicester, is designed to seat 400 persons, the material used for the exterior work being chiefly local bricks.

New Chapel, East Harptree, Somersetshire.—A new chapel at East Harptree was opened on Whit-Monday. The building comprises a chapel, with seating accommodation for 200, a vestry, four class-rooms, and a caretaker's house, with the necessary outbuildings. The whole has been built of local stone, with freestone dressings, from the designs of Mr. Bird, of Radstock, the builder having been Mr. J. Flower, of West Harptree.

Restoration of Parish Church, Rackenford, North Devon.—At Rackenford the restored parish church has just been re-opened. Mr. A. Blomfield Jackson was the architect; a new roof has been given to the church, the old carved oak ceiling cleansed of whitewash, the sanctuary enlarged, a chancel formed, the whole church repaved and wood-blocked, the seating modernised, and some oak choir seats, pulpit, and reading-desk placed in the chancel.

Roman Catholic Church, Bocking, Essex.—The new Roman Catholic Church at Bocking has just been opened. The church forms part of a Franciscan conventual establishment, the nave being reserved for the use of the sisters, and the transept for the general public. The latter portion is 25 ft. by 20 ft., and the nave is 40 ft. long and 20 ft. wide, and the stalls for the sisters are of oak. The altar and reredos are not yet completed, but they will be of Hopton Wood stone and Lancashire marble, with the front of glass mosaic. The flooring of the church is of wood blocks, the ceiling is of a different colour in the various parts, that of the transept being terra-cotta, over the chancel the ceiling is blue, while in the nave it is green. Attached to the chapel are the usual convent premises. The architect is Mr. J. F. Bentley, Adelphi, and the builders are Messrs. A. Brown & Son, Braintree.

Church and Schools, Creswell, Nottingham.—On the 23rd ult., the memorial stone of a new church at Creswell was laid, and new schools in connexion with the church were opened. The church is being built by Messrs. Bowman & Sons, of Stamford, from the designs of Mr. Louis Ambler, of London, and will consist of nave, chancel, organ-chamber, and two small aisles, the material used being brick and stone. It will provide accommodation for 350 persons. The schools have been built by Mr. Simkins, of Bolsover, from the designs of Messrs. Brewill & Bailey, of Nottingham, and accommodate 450 children.

St. Oswald's Church, Preesall, Lancashire.—The newly-erected Church of St. Oswald, at Preesall, was consecrated recently. The church, which is in the Gothic style, will seat 230 worshippers; its cost is 2,800*l*. Messrs. Cox & Greg, of Fleetwood, were the contractors for the stonework, Mr. J. Kirkbride for the joinery, Woods & Jackson for the painting, and the whole edifice has been erected from the designs of Messrs. Austin & Paley, architects, of Lancaster.

Church, Denaby Main.—The foundation-stone has just been laid of a new church at Denaby Main. The church is to be built of local stone, with a pitch pine roof, covered with red tiles. The nave will measure 81 ft. by 40 ft., and there will also be vestries, chancel, baptistry, sacristy, and organ chamber. The new church is to accommodate about 500 persons, and the estimated cost is 3,500*l*. When this is completed it is intended to erect a new vicarage, which will cost a further sum of 1,500*l*. The joint architects are Messrs. Fowler (Durham) & Smethurst (Denaby), and the contract for the building has been let to Messrs. B. Wortley & Sons, Doncaster.

Church of the Sacred Heart, Omagh, Ireland.—On the 28th ult. the new Church of the Sacred Heart, Omagh, was dedicated. This church, of which the foundation-stone was laid in June, 1893, stands on a site on the summit of the Hill of Omagh. It was designed by the late Mr. William Hague, architect. The church, which is Gothic in style, oblong in form owing to the exigencies of the site, consists of sanctuary, chancel, nave, and aisles. The chancel arch which connects the nave with the sanctuary is supported on lofty pedestals rising to a height of 46 ft., and has a span of 36 ft., with height from the spring of the arch to the apex of 20 ft. The nave is connected with the side aisles by nine arches on each side, supported on ten pillars of polished granite, with capitals of Portland stone. There are two bays in the sanctuary with side altars. The aisles are lighted with two-light lancet windows, divided by mullions. The window over the High Altar is of five lights. It is filled with stained glass, the work of Messrs. Mayer & Co., of Munich. The towers are at the western angles of the church, and the gable which they limit contains a large rose window. The smaller tower is of similar design to that at the south-western angle. Both towers terminate in open traceried parapet, with pinnacles at the corners, from which spring the spires. At the angles of the tower rest flying buttresses. The length of the church is 170 ft., and the width 66 ft. The flooring of the sanctuary is in mosaic of decorative design, and the passages are tiled, and the entire church seated in keeping with the other fittings. A communion rail and gates enclose the sanctuary. Brass gas standards are fitted throughout the church. The cost has been about 20,000*l*. Mr. Joseph Colhoun, of Londonderry, was the contractor.—*Freeman's Journal.*

SS. Mary and John Schools, Oxford.—The Bishop of the Diocese opened recently the addition which has just been completed to the Cowley SS. Mary and John Schools, and which will give increased accommodation for both boys and girls. A site having a frontage of 112 ft. and a depth of 240 ft. was secured, extending from Essex-street to Hertford-street. The buildings will be sufficient for 170 boys and 170 girls, bringing the total number up to 680. The new building is in keeping with the other part, and is of red brick, with casement windows, and the rooms are on the ground and first floors; four of them are 25 ft. square, making the number of these six, and sixty children can be taught in each; two other rooms capable of holding seventy and ninety children respectively have been added to the two others of the same capacity, and there are also two new teachers' rooms, two cloak-rooms, and the necessary offices. The buildings have been erected by Mr. S. Hutchins, from the plans of Messrs. Bucknall & Comper, Westminster, at a total cost of 5,400*l*.

Baptist Sunday School, Acton.—A new Sunday school and lecture-hall has been erected at the rear of the Baptist Church in Church-road, Acton. The architect was Mr. E. Monson, of Acton.

Church Schools, Darfield. — Foundation-stones of a new church school at Darfield were laid on the 18th ult. The new school will consist of three class-rooms, the largest to be 105 ft. by 22 ft. Mr. A. B. Linford, of Wombwell, is the architect.

Carnegie House, Montrose Asylum.—The Carnegie House for private patients in connexion with the Montrose Royal Lunatic Asylum has just been opened. The entire length of the building from end to end is 225 ft., and the distance from back to front is 125 ft. It is constructed of Brechin stone, and consists of a centre block and wings, which may be represented by the letter E. The central portion comprises on the ground floor a hall or common central apartment, 52 ft. by 22 ft., while on the first floor there is the dining-hall. On the ground floor a corridor, 8 ft. in width, extends from the central hall to the west (or ladies') entrance, and a similar corridor extends to the gentlemen's entrance at the east end of the house. At the west end of the building, on the ladies' side, there are two drawing-rooms. At the opposite end of the House two parlours of similar dimensions to the drawing-rooms, and also a billiard-room, have been provided for the use of the gentlemen patients. Between the drawing-rooms and the entrance hall on the one side and the parlours on the other there are several private parlours. The ground floors of the wings are occupied by single bedrooms, and all the necessary lavatory and bathroom accommodation as well as cloak-rooms. At the two ends of the north wings there are isolated suites of two small rooms, with porch entrances to each. For the use of the matron rooms have been provided at the west side near the ladies' entrance. The heating chamber, vegetable sculleries, coal cellars, and other necessary equipments are located on the ground floor behind the central block. The dining-hall is situated immediately over the central entrance. The timber roof is divided into twelve panels, decorated with paintings, the subject being the signs of the zodiac. Immediately behind the dining-hall on the first floor there is the kitchen department, servants' and attendants' halls, &c. On either side of the dining-hall and in both wings there are fifteen single bedrooms of various sizes and two dormitories, access to these appartments being obtained by separate staircases and corridors, 8 ft. wide, over the ground floor corridors. On the second floor, over the central block, single bedrooms and dormitories have been provided for the attendants and servants, the third story being also occupied by servants' bedrooms. The electrical fittings have been supplied by Messrs. Singer, Frome, Somerset. The architect of the house was Mr. William Kelly, Aberdeen, and the work was carried out by the following contractors:—Mason, Mr. Alexander Crockett, Brechin; carpenter, Mr. John Raitt, Montrose; slaters, Messrs John Lindsay & Son, Montrose; plumber, Mr. James L. Warden, Montrose; glaziers and decorators, Messrs. James Garvie & Sons, Aberdeen; outside painting and inside varnishing, Messrs. Clark & Son, Montrose; plasterers, Messrs. Scott & Sellar, Aberdeen. The decorative work and chimney pieces were made by Messrs. Garvie, Aberdeen. The engineering works in connexion with Carnegie House, as well as the other engineering works in course of execution at the asylum, have been designed and supervised by Mr. T. Young, consulting engineer, Glasgow.

Addition to Cottage Hospital, Beckenham.—Princess Henry of Battenberg opened the extension to the Cottage Hospital at Beckenham on the 18th ult. The new wing has been made to harmonise with the older portion of the building, to which it is connected by a corridor. On the ground floor is a men's ward, 35 ft. by 22 ft., capable of accommodating eight beds, with bath-rooms and lavatories adjoining. On ascending the staircase a ward for women is reached, the dimensions and arrangements being similar to those of the one below. Messrs. Syme & Duncan, builders, of Beckenham, have carried out the contract, the architect being Mr. William G. Bartleet.

Mechanics' Institute, Haltwhistle, Northumberland.—The foundation-stone has just been laid of the Haltwhistle Mechanics' Institute. The plans, prepared by Messrs. Oliver & Dodgshun, architects, Carlisle, were accepted after a competition among a limited number of architects. The Institute comprises a three-story building, faced with white stone. This building contains the committee-rooms, reading, billiard, and smoke rooms, with an entrance hall and grand staircase. Advantage has been taken of the level of the ground to place the recreation rooms in the basement, where provision will be made for gymnastics, &c., while the billiard and smoke rooms are located in the upper story. Behind this will be provided the large hall of one story, 70 ft. by 37 ft., affording sitting accommodation for over 400 persons.

Business Premises, Perth. — A four-story building comprising shops, offices, and dwelling-houses has just been completed at the corner of

South-street and Scott-street. The building was designed by Mr. David Smart, of Perth, under whose superintendence it was erected by the following contractors:—Masons, Messrs. Robert Brand & Son; joiners, Messrs. Leith & Lumsden; slater, Mr. James Buchan; plumber, Mr. James MacLeish; and plasterers, Messrs. John MacKay & Son, all of Perth.

WORKHOUSE FOR GREENWICH.—Workhouse buildings are being erected for the Greenwich Union Guardians at Grove Park. Mr. Thomas Dinwiddy, of Greenwich, is the architect, and Mr. Rowbotham, of Birmingham, is the contractor, his tender amounting to 175,020*l.* The site, of irregular form, has an area of 9½ acres, with a frontage of about 600 ft. to Marvel's-lane. At the entrance are placed the lodge and visiting departments, with receiving wards, clothes and furniture stores, &c., to the left and right. The administrative block is centrally placed, and is connected with the nine pavilions and the chapel by open arched corridors. It contains offices and committee room and residences for master and officials in the front portion, and a central store with gallery, clothes stores, linen-room, mess-rooms, central dining halls for aged and able-bodied inmates, divided for the two sexes, kitchen, scullery, larders, bread-room, &c. There is dormitory and day-room accommodation for 262 aged males in three pavilions, for 178 aged females in two, for 200 able-bodied males in two, and 100 able-bodied females in a further pavilion. There is also on the female side a block with accommodation for twelve married couples. Two small isolation wards are provided in a remote corner. Provision for fire escape to the upper floor of each pavilion is obtained by external cast-iron balconies and staircases. Sites are reserved for future provision to the extent of three further pavilions, in connexion with which the dining halls in the administrative block have been planned to allow of extension at any future time without disturbance of the first buildings. There is also open space reserved for additional staff. The chapel, to seat 400, is situated in the rear of the administrative block, centrally placed between the different classes and sexes. In a block next the able-bodied pavilions are provided the laundry departments, with engine and boiler houses, bakery, &c. Flour stores are placed in the water tower, which is surmounted by a 20,000 gallon tank. Establishment and labour shops, with hand corn mills and a stoneyard, are planned near the able-bodied quarter, and smaller shops are provided for the aged inmates. A mortuary and small stable accommodation complete the scheme. The buildings are being faced with red pressed bricks from the Tunbridge Wells district, with a spare use of Portland stone, and are to be covered with Welsh rag slating. Internally glazed facings are to be used to the dining halls, kitchen, larders, stores, &c., and throughout the laundry block.

NEW COTTAGE HOSPITAL, CARSHALTON.—On the 24th ult. a new Cottage Hospital was opened by Lord Rosebery. The hospital owed its origin to a legacy of 300*l.* by the late Mr. Thomas Morgan, of that village, if his trustees were satisfied that a scheme for the erection of it could be carried out within twelve months from the time of his death. A committee was formed and funds promised, and a freehold site was given by Mr. J. D. Hayton, architect, of Carshalton. The hospital has been erected by Mr. S. J. Evans, builder, of Carshalton, from a design by Mr. W. W. Gale, Surveyor to the Urban District Council, at a cost of 1,100*l.*; and the furniture and fittings have cost another 300*l.* On the ground floor at each end of the building are two wards, one for male patients, and the other for females, each containing a couple of beds; and in addition there is in the female ward a cot to be used for children, if required. There is also an emergency ward with accommodation for one bed. This room is also available for operations. A lavatory is fitted up in each of the wards, which are paved with wood block floors. On the ground floor also is provided the matron's room, and kitchen, scullery, and the usual offices. On the first floor are four bedrooms, one for the matron, one for the nurse, and servants, and a spare bedroom. There is also a bathroom, with hot and cold water services, and a large linen cupboard. Electric bells have been fitted to each room.

A NEW THEATRE FOR HOLLOWAY.—A new theatre is to be erected at Holloway, to be called the Marlborough. It will be close to the Nag's Head, and within a few minutes' walk of Finsbury Park station. The plans have been prepared by Mr. Frank Matcham.

NORFOLK COUNTY ASYLUM.—Extensive alterations and additions are about to be made at the Norfolk County Asylum, Thorpe, near Norwich. The proposed works comprise wards for 140 additional patients, new blocks for attendants and nurses, alterations to administrative offices, new workshops, electric installation, &c. Mr. A. J. Wood, London, has been appointed architect for the work.

VICTORIA PIER AND PAVILION, COLWYN BAY.—The first pile for the new pier was driven on the 29th ult. The work is being carried out from the designs of Messrs. Mangnall and Littlewoods, Manchester; the Widnes Foundry Company being the contractors for the first section, including the pavilion, which has to be completed by the end of this year. The Royal Assent was given to the Board of Trade order on August 2, 1898, and an agreement has been entered into for granting a lease of the foreshore by the Colwyn Bay District Council. The pier promenade leading to the pavilion will be 40 ft. wide, this being as wide as any modern pier recently erected, and constructed with iron piles placed at intervals, securely braced together, supporting steel rivetted girders of spans that are considered strong without any extravagant use of metal, based on experience gained in the construction of two piers and pavilions recently erected at Morecambe. The pavilion is situate 50 yards away from the entrance to the pier on the right hand side; it will have a dome and campanile towers treated in the Renaissance style, and it is calculated to hold about 1,500 persons. On three sides of the pavilion will be a gallery; with tiers of seats in front and a promenade behind, two external balconies for promenade purposes are accessible by doors from the gallery. Cloak-rooms, lavatories, and shops are provided. On passing through the turnstile there is a crush hall leading to the body of the hall; a staircase leads to the gallery above from the hall. Refreshment bars are provided. The seating of the body of the hall is sub-divided into reserved and ordinary seats. The stage has been specially designed for high-class dramatic, variety, and orchestral performances on an extensive scale, and will be fully equipped with all the modern appliances for these several performances. All possible precautions have been taken that the audience may be able to disperse rapidly in case of a panic, sufficient exits being provided to empty the building in two or three minutes. It is intended next year to complete the second section, which will comprise the continuation of the pier to 350 yards in length and 30 ft. in width, the extremity being widened out for open-air music and other entertainments. Shops and shelters will be provided at each side, with a handsome band kiosk in the centre, provision being made round three sides of the pier head for embarking and landing boats. Shelter kiosks will be placed at intervals along the pier.

POLICE-COURT AND BUILDINGS FOR DARLASTON. The Staffordshire County Council recently acquired a site near to the Darlaston Town Hall on which it has been decided to erect police-court and police buildings, &c. Plans have been prepared by Mr. Joynson, and building operations will soon be commenced.

### *SANITARY AND ENGINEERING NEWS.*

NEW BRIDGE, GLASGOW. — The opening of Glasgow's new bridge took place on Wednesday last week. The new bridge crosses the Clyde at the foot of Jamaica-street. The former bridge on the same site was erected in 1835, from designs by Telford. The reason for reconstruction was the weakening of the foundations caused by the dredging operations of the Clyde Trust. The engineers of the new bridge were Messrs. Blyth & Westland, Edinburgh; the contractors, Messrs. Morrison & Mason, Glasgow.

NEW DOCKS FOR THE PORT OF LONDON.—We hear that the firm of Sir John Jackson, Limited, have contracted to execute the works, as planned and designed by Sir Benjamin Baker and Mr. P. W. Meik, for the construction of new deep-water docks at Dagenham, Essex, at an estimated cost of about two millions sterling. It is expected that the docks, where various labour-saving appliances are to be used for loading and unloading cargoes, will be completed three years hence.

PROPOSED REFUSE DESTRUCTOR FOR LIVERSEDGE, YORKS.—An inquiry was held at Liversedge on the 26th ult. by Colonel Coke, on behalf of the Local Government Board, upon an application of the District Council for powers to borrow money wherewith to provide a refuse destructor. Mr. F. Leslie Watson, A.M.Inst.C.E., submitted plans of the destructor works on behalf of the Horsfall Furnace Syndicate.

PROPOSED BRIDGE, COXGREEN.—At a meeting of the Chester-le-Street Rural District Council the Joint Committee's of the Chester-le-Street and Houghton-le-Spring Rural District Councils' recommendations that these two Councils subscribe to the cost of the above bridge were unanimously approved, provided satisfactory public financial support is given to the scheme, and that the County Council of Durham be again interviewed as to their contributing to this much-needed public improvement. Great interest is being taken in the neighbourhood of Washington, Usworth, Coxgreen, and Penshaw, regarding the necessity for the erection of this footbridge, which crosses the River Wear from Coxgreen to Washington Staiths. The only means of access at present is by means of ferry-boats, which are stopped in times of flood and after ten o'clock at night. The proposed structure will be a steel arched bridge of 150 ft. span, having stone abutments founded on rock, the underside of the bridge being 30 ft. above high-water mark. The plans have been prepared by Messrs. D. Balfour & Son, of Newcastle and London.

DRAINAGE SCHEME, DORCHESTER. — On the 25th ult. Mr. H. Percy Boulnois held an inquiry at the Town Hall, Dorchester, on behalf of the Local Government Board, into an application of the Town Council for permission to borrow 16,000*l.* for purposes of sewerage and sewage disposal. Mr. G. J. Hunt, Borough Engineer, described in detail the nature of the proposed works.

### *STAINED GLASS AND DECORATION.*

WINDOW, BUSBRIDGE CHURCH, NEAR GODALMING.—A memorial window which has been placed at the west end of this church was unveiled on the 20th ult. The window is from a design by the late Sir E. Burne-Jones.

MEMORIAL WINDOW IN THE GUILDHALL, YORK. —A stained glass window in memory of Sir Joseph Terry was unveiled in the Guildhall, York, on the 27th ult. The window was designed and executed by Messrs. Shrigley & Hunt, of London and Lancaster.

DECORATION AND REPAIR OF ST. JAMES' CHURCH, HAMPSTEAD-ROAD.—This church has just been reopened after thorough internal decoration and repair. The Sanctuary floor has been raised and laid with wooden blocks; the walls have been panelled with carved oak, a baldachino erected over the altar, with paintings of two censing angels above. Outside the church a wrought-iron structure of artistic design has been erected. The whole work was carried out by Messrs. Percy Bacon & Bros., of London.

WINDOW, STRADBROKE CHURCH, SUFFOLK.—A stained glass window has been placed in the south side of Stradbroke Church, in memory of Mr. T. B. C. West. The window was supplied by Messrs. Clayton & Bell, of London.

### *FOREIGN.*

FRANCE.—The new Opéra Comique house is already to be considerably altered to remedy the small size of the stage and the insufficient storage for scenery.——A monument to M. Faure is to be erected at Père Lachaise, from the design of M. Saint-Marceaux, consisting of a portrait statue with some symbolical accessories. Another sculptor, M. Peynol, has been commissioned to design a monument to Français, the late landscape painter.——The municipality of Paris has set apart a considerable sum for various new school buildings in Paris, and for the erection also of a new municipal library.——The Municipality of Lille are about to devote a sum of 35,000,000 francs to the execution of certain works of architecture and road construction.——M. Loviot, who exhibited the drawings for “La Grande Salle des Fêtes” to be formed in Galerie des Machines, noticed in our review of “Architecture at the Paris Salon,” has received the medal of honour in the architectural section. In the section of painting the medal has been awarded to M. Tattegrain, for his large picture of the evacuation of St. Quentin; and in that of sculpture to M. Dubois, for his “Pardon.” ——The death is announced, at the age of seventy six, of M. Vacquer, assistant curator of the Carnavalet Museum, and the author of some important works on archæological subjects, and who was concerned in some of the most important excavations carried on in Paris during the last thirty years. He was associated with the late M. Berty in all the work of the latter in connexion with the topography of “Vieux Paris.”

### *MISCELLANEOUS.*

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS. The offices of the Tribunal of Appeal under the London Building Act have now been removed from the temporary premises in Savoy Hill to the new building of the Surveyors' Institution, and all communications should be addressed “To the Clerk to the Tribunal of Appeal, London Building Act (1894), 13, Great George-street, Westminster, S.W.”——The Coalbrookdale Co. have removed their London showrooms from the Victoria Embankment to large premises at 141, Queen Victoria-street, E.C., with a goods entrance at 231, Upper Thames-street.

INSURANCE IN THE BUILDING TRADE, YORKSHIRE.—A meeting was held at the Bradford Building Trades and Stone Exchange on the 25th ult. to consider a proposal for the establishment of an insurance society against accidents, to comprise all the building trades in Yorkshire. It was reported that Leeds had not replied to the Bradford circular on the subject, but that a sympathetic reply had been received from Halifax. It was decided to form a society to cover the risks incurred from accident by the members of the Bradford Stone Exchange, and members of the directorate intimated their willingness to guarantee a fund sufficient for the purpose of inaugurating the scheme.

THE LIGHT RAILWAYS ACT, 1896.—Several applications are before the Light Railways Commissioners in respect of light railways in various parts of the kingdom. The projects comprise lines (by the Finchley Urban District Council) along the Great North-road, through East Finchley and Whetstone, to Barnet; by the Hornsey Urban District Council, along the Archway and Great North-roads; by the Finance, Mines, and Industries Association, from Bishop's Waltham, through Swanmore, Droxford and Soberton, to the Meon Valley railway of the L. & S. W. line; by Power and Traction, Limited, from the Great Eastern line at Oakington to Cottenham, passing through Westwick; by the Escrick and Riccall Rural District Councils, in the Derwent Valley; by certain "promoters," from Whitchurch to Vernhams Dean, Hants, through Bourne, Stoke, Hurstbourne Tarrant, and Upton, in the Bourne Valley; and by the Nuneaton and District Light Railway Company, in the Urban Districts of Nuneaton and Chilvers Coton, and Atherstone, co. Warwick.

Properties for Sale —(1) The Sterborough Castle Estate, near East Grinstead and Lingfield, comprising about 400 acres, and a mansion, together with the remains of Sterborough, or Prinkham, Castle, originally built by Reginald de Cobham, 1342, who fought at Creçy and Poictiers, a grandson of Reginald de Cobham, who married the daughter and heir of William de Hever, of Hever Castle. The castle, which was garrisoned in the Civil War by the Parliament forces, and dismantled in 1648-9, appears in an old drawing as having a round tower at each angle, with a draw-bridge, and inner quadrangle, covering, together with the moat, an area of one and a half acre. The property passed through various hands, including Lord Cobham, who founded the college at Lingfield, and whose daughter married Humphrey, Duke of Gloucester; Ralph Nevill, Earl of Westmoreland; Sir Thomas Richardson, Chief Justice of the Queen's Bench (*obiit* 1634); and John Tonge, who about seventy years ago purchased it from Alderman Smith's executors, and built the new house. (2) "The Olde House," Dogpole (Duckpol), Shrewsbury, an Elizabethan oak-timbered house, which we believe is that which is depicted (as L-shaped on plan, and with a forecourt, opposite St. Mary's-turnstile) in the wood-cut in Owen and Blakeway's "History of Shrewsbury," vol. i., 1825, from a drawing by J. Buckler, and known as the house of Master Thomas Jones, the lawyer; being the house occupied by Prince Rupert after the first siege of Worcester, and by Prince Charles and the Duke of York in 1642, when Charles I. went to Shrewsbury after he had raised his standard at Nottingham on August 22. (3) Chalfont Park, Buckinghamshire, lying on the right-hand side of the high road from Uxbridge to Amersham, nearly 1,000 acres in extent, with a beautifully timbered park of 250 acres on hilly ground, and woodlands, watered by the Misbourne. There is a dower house, known as Chalfont Lodge, on the estate. The mansion house was designed by Chute for General Churchill.

Jerry-Building in Leeds.—The Building Clauses Committee of the Leeds Corporation, at a meeting on the 26th ult. passed a resolution requiring that in future all mortar used for buildings shall consist of not less than one part of lime to two parts of good engine ashes, or clean river sand. This resolution was the outcome of a report presented by Mr. Fairley (city analyst) showing that many samples recently analysed fell far below this standard. As a result of the action of the committee, the building inspectors of the Corporation will, of course, have power to take samples of any mortar being used for building purposes, and have them submitted for analysis.

Excavations at Canterbury Cathedral.—Excavations conducted by Mr. St. John Hope on behalf of the Society of Antiquaries have been in progress during the past few days in the garden adjoining the residence of the Bishop of Dover, in the Precincts of Canterbury Cathedral. Five Early English corbels were found beneath the site of the old monastery dining-hall, similar to those recently found during excavations for the Archiepiscopal Palace. The discoveries go to prove that the whole of the buildings on this side of the cloisters were entirely rebuilt in the second quarter of the thirteenth century.

Lincoln Master Builders' Association.—The inaugural dinner of the Lincoln Master Builders' Association was held at the Spread Eagle Hotel, Lincoln, on the 25th ult. The President for the year (Mr. W. H. Close) occupied the chair, and Mr. E. V. Lansdown was in the vice chair. The loyal toasts having been proposed, Mr. J. M. Harrison, submitted "The Mayor and Corporation." Mr. Wm. Watkins, an ex-Mayor of Lincoln, responded. The Chairman then submitted the toast of "The Lincoln Master Builders' Association" (branch of the National Association of the Master Builders of Great Britain), and having traced the history of the local Association, he said he thought there was never a better understanding between the building trades of the city than at the present time. They were able to settle the differences between the operatives and themselves a year ago, and were able by a certain amount of tact and forbearance, and a display of conciliation, to come to terms. With regard to the unfortunate dispute between the Master Builders' Association and the plasterers, there was in sight a means of settlement which would be agreeable to all parties concerned. Mr. S. Horton proposed "The Architects," and Mr. Watkins, Mr. Cooper, and Mr. Dunn acknowledged the toast. Other toasts followed.

Hall of Records, New York.—The architect's plans and specifications for the magnificent new Hall of Records for New York have been issued, says the *Liverpool Mercury*. They require $2,000,000 to be spent on the external building proper, and $2,500,000 additional to complete the interior. The estimate for sculpture is $85,000, and for mosaic work is $10,000. No wood whatever will be used, the interior being entirely of coloured marble and the window frames of copper. The Mayor, the Board of Comptrollers, and the city engineers are in favour of adopting the architect's recommendations.

Archæological Discovery in Leeds.—A discovery that has been made within the last few days in connexion with the laying of new cables for the conveyance of electric light from the generating station of the Leeds Corporation in Aire-street, Leeds, to the centre of the city, is likely to cause some interest among local archæologists. The work that is in progress is the laying of eleven fresh cables into Wellington-street, on the latest and most approved principles. In excavating to the proper level the workmen came across a splendidly-preserved stone arched vault in Aire-street. Its area was 20 ft. long, 12 ft. wide, and 10 ft. high to the crown of the arch. Subsequent excavations showed that it was one of a series of five beautifully preserved arches of similar dimensions, the walls between the arches being about four and a half feet thick and in splendid preservation. A still more startling discovery was made after the vaults had been bared, for it was found that, in addition to having communication with each other, there was in the one farthest from Wellington-street an entrance to a subterranean passage. This had evidently been blocked up years ago, and only theories can be formed as to the object with which it was built, and with regard to its objective point. —*Yorkshire Post.*

The British Fire Prevention Committee.—At the testing-houses of this Committee an important series of investigations is again in hand. Among the tests is one with a floor of steel joists and concrete filling, the concrete being of the aggregate lately allowed by the London County Council. Another floor under investigation is a solid timber floor, and a third is a floor by the Columbian Fire-proofing Company, U.S.A., which is to be subjected to very high temperatures. Various forms of doors of wood, armoured wood, and iron will be under investigation, also silicate partitions and ceilings by Messrs. Anderson and Messrs. Broadbent, some patented partitions and plasters, some plain electro-glazed windows by the Luxfer Prism Syndicate, and lastly, some of the non-flammable materials. A set of ordinary partitions have also been recently tested. Owing to the numerous applications to visit the station, the Executive have asked us to remind would-be visitors that the attendance is still strictly limited to the members, by rotation, and a few special guests.

Business Premises, Jewin-street, City.—A block of business premises at the corner of Jewin-street and Well-street has just been completed. The site was included in the Cripplegate fire area. The building, which is lighted by electricity and consists of six floors, was erected by Messrs. Killby & Gayford, the architects having been Messrs. Ford, Son, & Burrows.

## *CAPITAL AND LABOUR.*

The Norwich Building Trade.—One section of the building trade of Norwich has been satisfied. The labourers have accepted the terms offered by the employers, and have also adopted a resolution in which the courtesy with which the negotiations has been conducted is acknowledged.

Wolverhampton Plumbers' Dispute.—There has been an amicable settlement arrived at between the plumbers and the master builders, of whom the latter were called upon to accept the demands of the men for an ½d. advance per hour, viz., 8½d. to 9d. Early in the month the employees served the masters with a notice which should have expired on the 19th ult., but were extended, to meet the masters' wishes, a fortnight. On Tuesday night a conference took place at the Victoria Hotel, Wolverhampton, between representatives of the Master Builders' Association, the master plumbers, and the operative plumbers, with the result that a settlement was arrived at, and a formal agreement signed. The question of an advance was deferred for the present year, if not *sine die*. The men demanded the adoption of a code of working rules, and their proposals were practically accepted *en bloc*, the rules being the same as have been in force between the master plumbers and men.

The Strike of Wakefield Joiners. — The Wakefield joiners and carpenters who are at present on strike, owing to the masters refusing to accede to their demands to sign a code of working rules, have decided to approach the employers with a view of coming to an amicable settlement, and to each they have sent a circular asking the following question :—"Providing the clause relating to piece-work is expunged from the rules, are you prepared to sign them; if not, are you in favour of the dispute being submitted to the Wakefield Board of Conciliation, and to abide by their decision?"

Yorkshire Building Trade.—So far as the Yorkshire lock-out of all building trades is concerned, matters remain much as they have been, the latest phase being the resolution of the Scarborough employers to lock out their men, the season trade having now practically finished. There is nothing really fresh to record in regard to the strike of the London Order of Bricklayers in Leeds. The local branch of this organisation has resolved upon a half-crown levy for the support of the men locked out or on strike. The men received their first strike pay, amounting to 15s. each, on Saturday last.

## *LEGAL.*

### THE WORKMEN'S COMPENSATION ACT.

In the City of London Court on the 26th ult. Mr. Pitt Lewis, Q.C. (Deputy Judge), disposed of the first case which had come before the Court under the Workmen's Compensation Act, 1898. Fred Martin, Plaistow, labourer, sued the London and India Docks Joint Committee to recover compensation for personal injuries which he had suffered while in their service. Mr. Giveen was counsel for the plaintiff, and Mr. George Wallace for the defendants. The defendants not only denied their liability to compensate the plaintiff for the accident which had happened to him while he was working for them, but disputed the basis on which he was to be paid, even if he was entitled to recover. The applicant was working as a labourer in a warehouse belonging to the defendants situated close to Houndsditch. While working close to a skylight near the roof, the plant on which he was standing gave way, and he was thrown to the ground. His jaw was fractured, and he sustained other injuries. Oddly enough he had only been in the service of the Dock Committee for a day and a half, and after the accident they forwarded him 7s. 3d. as his wages. The first section of the statute, said the counsel for the plaintiff, entitled the man to recover damages for injuries received by accident "arising out of and in the course of the employment." Section 7 stipulated that liability only existed when injuries had been sustained "in or about a railway, factory, mine, quarry, or engineering work," or "in or about any building which exceeded 30 ft. in height, and is either being constructed or repaired by means of a scaffolding, or being demolished, or on which machinery, driven by steam, water, or other mechanical power, is being used for the purpose of construction, repairing, or demolition thereof." One of the sub-sections stated that "factory" had the same meaning as in the Factory and Workshop Acts, 1878 to 1891, and also included "any dock, wharf, quay, warehouse, machinery, or plant to which any provision of the Factory Acts is applied by the Factory and Workshop Act, 1895, and every laundry worked by steam, water, or other mechanical power." As to the basis on which the plaintiff's damages were to be assessed, it was contended on his behalf that, as he earned 7s. 3d. in a day and a half, it must be presumed that if he had gone on working he would have earned 26s. to 30s. per week. That was the claim which he was now putting forth. He was at work in raising materials by means of a pulley, and, therefore, was engaged in the exercise of "mechanical power." The defendants' case was that no liability could attach to them at all. The Act of Parliament made them liable for accidents happening in any "dock, wharf, quay, or warehouse." That meant that the warehouse must be one which adjoined or was contiguous to some wharf, dock, or quay. It could not be argued that employers were responsible under the Workmen's Act for any accident that happened in any class of warehouse. The warehouse where the plaintiff met with his injuries was situate a mile away from the defendant's docks. That being so, it could not be suggested that the warehouse was in any sense a part of the docks, quay, or wharf. It did not follow that the plaintiff would have earned 26s. or 30s. per week. He was a casual hand, and was only entitled to have his damages measured according to what his average weekly wages would have been. In delivering a considered judgment, the Deputy Judge said the case was like solving a conundrum, arising, as it did, out of that extraordinary tangle of legislation called the Workmen's Compensation Act. The statute seemed to have been drawn by a person who had strayed into the land of topsy-turveydom. The man who drew the Workmen's Compensation Act did not know what he meant, and did not repeat it. The draughtsman had left the Judges to guess what was meant. He (the Deputy Judge) was willing to do that, but he was afraid that it was only a guess he could make in solving the problem. His decision must be unfavourable to the plaintiff, for he was bound to hold that he could not recover. He could not hold that the warehouse in which the accident happened was one that came within the purview of the Act under which the proceedings had been brought. No doubt the case was an important one to employers and workmen alike, and probably both sides had organisations which would take up the matter. He would be sorry if it rested where it was, because the points in question were important. Even the Court of Appeal shrank from deciding almost anything under the Workmen's Compensation Act; and really there was no wonder at it. It was, indeed, a wonderful piece of legislation, and he was very sorry to have to construe the various sections which had been submitted. Execution would be stayed with a view to an appeal.—*City Press.*

◆

## MEETINGS.

### SATURDAY, JUNE 3.

*Association of Municipal and County Engineers.*—Yorkshire District Meeting, Sheffield.

*Edinburgh Architectural Association*—Annual excursion. Visit to Arbroath Abbey, &c.

*Northern Architectural Association.*—Visit to Chester-le-Street and Lumley.

### MONDAY, JUNE 5.

*Society of Engineers.*—Mr. R. G. Allanson-Winn on "Foreshore Protection, with special reference to the Case System of Groyning." 7.30 p.m.

### TUESDAY, JUNE 6.

*Glasgow Architectural Association.*—Annual Business Meeting.

### WEDNESDAY, JUNE 7.

*Institution of Civil Engineers.*—Engineering Conference, to be opened with an address by Mr. W. H. Preece, President. 10.15 a.m.

*Royal Archæological Institute.*—(1) The Worshipful Chancellor Ferguson, F.S.A., on "Consistory Courts and Consistory Places;" (2) Mr. Albert Hartshorne, F.S.A., on "Samuel Daniel and Anne Clifford, Countess of Pembroke, Dorset, and Montgomery." 4 p.m.

*British Archæological Association.*—(1) Mrs. Collier on "Some Mediæval Châteaux and Dwellings in France"; (2) Mr. Arthur Oliver on "Symbolism." 8 p.m.

*Builders' Foremen and Clerks of Works' Institution.*—Ordinary meeting of the members. 8 p.m.

*Institute of Sanitary Engineers (Incorporated).*—Meeting of the Election Committee at 2.30 p.m.; and the General Purposes Committee at 3.30 p.m.

### THURSDAY, JUNE 8.

*Institution of Civil Engineers.*—Engineering Conference (continued).

*Society of Antiquaries.*—8.30 p.m.

*Royal Architectural Museum and Westminster School of Art (Tufton-street, S.W.).*—Annual general meeting. Sir Wyke Bayliss on "The Bogey in the Studio—an Address to Art Students on the Questions of the Day." 4 p.m.

### FRIDAY, JUNE 9.

*Institution of Civil Engineers.*—Engineering Conference (concluded).

*Institution of Junior Engineers.*—Visit to the Bankside Works of the City of London Electric Lighting Company. 6.30 p.m.

◆

## RECENT PATENTS:

### ACCEPTED SPECIFICATIONS.

### *Open to Opposition until July 25.*

[1898] 4,328, McLarty, Apparatus for Cutting Stone or similar material. 10,874, Smith, Tube Joints. 11,076, Baivy, Telephone Installations. 11,170, Taylor and Others, Manufacture of Artificial Stone Slabs by Hydraulic Pressure. 11,201-2, Thompson and Others, and 16,120, Harrison, Prepayment Attachments for Gas and other Meters. 11,525, Wade and Electric Motive Power Company; 15,443, Veritys & Steele, and 15,785, Scott, Davis, & Wright, Electrical Switches. 11,696, Holt, Speed, Distance, and Gradient Indicators. 11,862, Beldams, Street or Road Gulleys. 12,044, Brown & Crossley, Door-attachments. 12,089, Bridge & Trainer, Models for the Teaching of Drawing. 13,376, Smethurst & Greig, Securing Fencing-wires to Standards. 13,460, von Pittler, Lathes. 14,698, Rayboulds, Composite Circular Saws. 14,841, Campbell, Circular-saw Guards. 15,060, Stanfield & Martin, Lathe Chucks, Drill-holders, &c. 15,132, Richard, View-finders. 15,411, Pertwee & Baxter, Spanners. 15,544, Hodgson, Grinding-pans for Materials to be Granulated. 15,656, Tschurl & Petraschek, Preservation of Wood. 15,664, Herbert, Casements. 15,665, Shaw, Unions for Joining and Coupling Pipes. 15,670, Tonks & Burn, Window-sash Fasteners. 15,762, Jowett, Gulleys and Sinks. 15,987, Hipkins, Scales and Balances. 16,016, Stephens, Window Ventilators. 16,096, Pickup, Waste Water Closet Pan. 16,157, Berger, Means for Moving Revolving Tool Carriers, &c., in a Direction at Right Angles to their Axes of Revolution. 16,870, Kerr, Brush-holder for use by Painters when Working with the Aid of a Pole. 18,368, Lygo, Attachment of Brushes, &c., to their Handles or Sticks. 19,862, Barth, Collapsible Ladders. 22,448, Keiths, Coal-saving Grate. 25,683, Green, Traps and Ventilators for Drains. [1899] 341, Rowland, Combined Heating, Cooking, and Ventilating Stove or Fireplace. 379, Proctor & Butterfield, Nail Extractors. 2,726, Flower & Gambrell, Electrical Measuring Instruments. 3,233, Belknap & Sundh, Conduits for Electrical Cables. 5,989, Patriarche, Lifting Dogs, &c. 6,030, Freundlich, Shaft Furnaces and Kilns. 6,978, Cope, Apparatus for Propelling, Purifying, Moistening, or Disinfecting Currents of Air, &c., for Ventilating and Other Purposes. 7,058, Griffiths & Hawker, Tipping Waggon. 7,574, De Léry & Armington, Gas Burners. 7,607, Lewis, Composition for use in Collecting or Saving Waste Gold Leaf. 7,789, Sackett Wall Board Company, Saturation of Plaster, Cement, &c., with Water. 7,877, Demuth, Generation of Acetylene. 7,917, Robinson, Connexions for Water-closets, Sinks, &c. 7,955, Tulloch & Harris, Stone-cutters' Mauls. 7,965, W. A. Baker & Co. & Summerfield, Stair Treads, Floor Coverings, &c. 8,114, Davis and Others, Application of Paint, Lacquer, and other Coatings. 8,135, Coe, Package Roll for Holding and Applying Metallic Leaf. 8,136, Lavigne, Automatic Manufacturing Company, Turret Lathes. 8,145, Seagrave, Adjustable Ladder Bases. 8,167, Biheller, Globes or Shades for Gas Lights.

### ABSTRACTS OF PATENTED INVENTIONS.

2,169.—GAS COOKING AND HEATING STOVES, COMBINED: *E. W. Beech & A. G. Melhuish.*—The novelty lies in the combination of a gas-cooking stove with a gas-fire, or argand burner, or other means for warming the room, which is independent of the cooking burners; on the door of the oven is fitted a gas-fire, supplied with gas through a union in a hinge of the door, and having a flue which communicates with a chamber at the stove's top, wherein is a water-heating coil connected with the boiler that may be heated also by turning the oven-burner flames against the water-tubes; the oven door is so hung that it may be opened from either side by means of a rocking-lever pivotted at its middle and having eyes that fit over pins at the lever's ends, when one of the two side-handles is turned to raise the connecting rod the eye above is lifted from its pin and the door can be opened about the other pin as a hinge, short pins resting in shallow sockets serving as the lower hinges; the stove has taps for hot and cold water, and its boiler can be adapted to effect the circulation of water through a hot-water cistern.

2,182.—COVERINGS FOR ROOFS AND WALLS: *P. Lehmann.*—Jute linen fabric is steeped in linseed oil boiled with silver litharge (a fused crystalline lead oxide obtained as a by-product in separating silver from lead), or a board composed of leather parings is steeped in a varnish of caoutchouc melted in boiling linseed oil; the dried fabrics are coated with whitening, silver litharge, washed earth colour and linseed oil varnish mixed together, powdered on either side with sand and ground sandstone, and then oil-painted on the outer side.

2,202.—COVERINGS FOR WALLS, &c.: *G. Stephens.*—On the colour prints, produced in tones and shades, are superposed transparent or opaque colours in oil, water, or other medium, by rollers, blocks, or other means, or by hand, in such a manner that the original prints are visible, wholly or partially, through the colours laid over them.

2,217.—SELF-CLOSING AND SHOCK-PREVENTING VALVES AND COCKS: *E. Segalli.*—The pressing down of the button causes the main valve to leave its seating, whereupon water flows through the tap. The descending valve forces down a flexible diaphragm, which rests within a bottom chamber, wherein the pressure conquers the resistance of a coiled spring above the diaphragm, and so opens a valve for the passage of water from the bottom chamber to that above the diaphragm. Upon release of the button the upper valve is closed by the spring, and the inner valve falls to its seating, but does not altogether close until the water which originally passed from the bottom chamber has returned through a notch made in the seating and the space between the spindle and the valve casing.

2,272.—BRUSH HANDLES, AND THEIR ATTACHMENT: *J. W. Buckley.*—For fastening handles to brush-heads, &c., is used a screw-eye, having a curved and pivotted loop, that may be used for hanging the brush, or be turned down to lie against the stock.

2,302.—DOORS FOR BUILDINGS: *W. A. McKay.*—Sliding doors are hung upon and between sectors having, preferably, a radius equal to the height of the door; one sector is pivotted on a bar attached to the door, whilst a bar, pivotted below, prevents the door from resting half-way; for hanging the doors sectors may be employed, together with ordinary rollers.

2,309.—APPARATUS FOR GENERATING ACETYLENE GAS: *G. Jacobi.*—The inventor's object is to maintain a constant supply of water to the carbide, and so to generate acetylene gas at an even rate; through a pipe fitted with a cock liquefied carbonic acid passes from a cylinder into a water reservoir, and, in passing, forces water through another pipe, also provided with a cock, to a funnel shaped distributor placed over a carbide container; the two pipes are connected by a branch which admits carbonic acid to the stream of water for distributing it over the carbide; the gas passes from the generator through a cylinder partly filled with glass wool, and thence through condensing pipes into a holder which has a pressure gauge; the funnel distributor is hinged, so that it can be turned aside whilst the generator is being charged

2,331.—BRICKS, BUILDING-BLOCKS, AND SLABS: *T. H. R. Guttridge.*—These are composed of ashes, clinkers, and the refuse from dust-destructors, ground and mixed with cement, oxide of iron, and water containing soluble glass, together with, it may be, sand or ground beach shingle; the bricks can be glazed, and roughened-glass facing-plates may be fixed on to them by means of soluble glass and Portland cement.

2,531.—GLAZING FOR ROOFS, &c: *W. Curbstone.*—The upper portion of the web of an iron or steel astragal, or glazing-bar is shouldered or enlarged that it may support the sheathing and wings of the lead or other soft metal; beneath the bar a dovetailed or similar projection or rib is made for engagement with a recessed wooden bar, or for supporting sheet-metal drainage channels for the water of condensation; channels may be made in the lead for asbestos or other packing.

2,553.—ANTI-FOULING PAINTS: *G. Warner & C. F. W. Perry.*—These are made of an admixture of oxide of iron, red lead, copper oxychloride, gums, white arsenic, shellac, boiled linseed-oil, naphtha, turpentine, and resin.

2,567.—A SOLDER FOR ALUMINIUM: *G. Hammond.*—The solder is composed of a tin alloy, 100 parts, silver, 20 parts, zinc, 10 parts, and aluminium, $\frac{1}{10}$ to 6 parts; iodine, or an iodide of tin or mercury alone, or mercury mixed with a hydrocarbon such as vaseline, constitutes the flux.

2,578.—WATER-WASTE PREVENTERS AND CLOSET-DISINFECTING APPARATUS: *W. A. La Fave.*—The disinfecting apparatus, placed between the basin and the flushing tank, contains an annular chamber which holds a soluble disinfectant passed in, through an opening, in the form of pellets, and into which a portion of the flushing water is turned by means of a lip, the water dissolves some of the pellets and joins the main stream through perforations below, since the water percolates slowly through the disinfectant it enters the basin as an after-flush.

2,623.—DISINFECTING DISCHARGE FOR WATER CLOSETS: *F. Carman.*—In order to deliver a quantity of disinfectant after each flush the material is put inside a part of the tank, to whose other part is fitted a pipe that leads to the basin, and has a valve which is normally held open by a lever of tubular shape, and engaging with a head upon the valve stem. When the closet is flushed the ball valve opens, and its lever—provided with a slotted link and gear—lifts the lower lever so that its contents pass into the chamber, whereof the valve is thereupon closed. As the water-level in the tank rises the lever falls to open the valve and allow the contents of the chamber to flow as an after-flush.

2,733.—CRANES AND DERRICKS: *W. E. Hutchinson & A. E. Newton.*—To facilitate the swivelling of the jib and load in one direction, by inclining the post out of the vertical position, the crane-post is secured to its footstep by means of a universal joint.

2,754. DOVETAILING MACHINERY: *R. Carlyle & R. D. Shannon.*—The invention applies to a machine which has a rotating conical cutter that cuts the dovetail in both boards at one operation; the boards are clamped, at right angles to one another, upon a table or frame adapted to slide in two rectangular directions, bevel gearing rotates, on a vertical axis, the inverted conical cutting tool, the boards are fed against the tool, then pulled back, and then pushed forward a step for the next dovetail to be cut in them, by means of a wheel having a single tooth that gears into a rack fixed upon the frame, a cam effecting the necessary advance of the boards to the cutting-tool, and the table being locked by a pin moved by a cam-groove whilst the cutting is being done.

## TO CORRESPONDENTS.

C.—W. S.—(Amounts should have een stated). S. R. (Too late; next week).

NOTE.—The responsibility of signed articles, letters, and papers read at public meetings, rests, of course, with the authors.

*We cannot undertake to return rejected communications.*

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

We are compelled to decline pointing out books and giving addresses.

Any commission to a contributor to write an article is given subject to the approval of the article, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and *not* to the Editor

## TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us *not later than* 10 *a.m. on Thursdays*. N.B.—We cannot publish Tenders unless authenticated by the name and address of the sender; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is given, nor any list in which the lowest Tender is under £100, unless in some exceptional cases and for special reasons.]

* Denotes *accepted*. † Denotes *provisionally accepted*.

## "The Builder" Student's Series.

Crown 8vo, 3s. 6d. post free.

**SPECIFICATIONS FOR BUILDING WORKS,** AND HOW TO WRITE THEM: a Manual for Architectural Students. By FREDERIC RICHARD FARROW, F.R.I.B.A.

The Chapter on Terra-Cotta by THOS. COOPER, A.R.I.B.A. and that on Electric Wiring, by ALEX. RUSSELL, M.A. (Cantab.), Lecturer to Faraday House, and NEVILLE T. PAYNE, A.I.E.E.

This Manual is written with a view to meet the requirements of the student, to show him how he should write a specification, so that when he has learnt the method and general principles, he may apply them to the particular exigencies of any building he may design.

"Every architect who takes pupils should insist that they obtain copies."—*Architect.*

"Will prove of service to the architectural student."—*Building News.*

"Full of practical hints and advice—has a good index."—*A. A. Notes.*

"Well fulfils a useful purpose."—*Glasgow Herald.*

"A handy manual—will be found extremely useful in the early days of student life."—*Liverpool Courier.*

Uniform with the above, 5s. post free.

**CARPENTRY AND JOINERY:** a Text-Book for Architects, Engineers, Surveyors, and Craftsmen (with over 420 illustrations), by BANISTER F. FLETCHER, A.R.I.B.A. and H. PHILLIPS FLETCHER, A.R.I.B.A., A.M.I.C.E.

The Authors have endeavoured to meet the requirements of the craftsman, and at the same time to produce a work that will be useful to the Professional man in the designing of the various structures. They have also endeavoured to consider the desires of those who are likely to become candidates for the examination of the City and Guilds Institute, the Carpenters' Company, and the Institute of Certified Carpenters, &c. Also for the examination in these subjects by the R.I.B.A. and the Surveyors' Institution, &c.

"Can be heartily recommended."—*A. A. Notes.*

"A concise treatise."—*Scientific American.*

"Admirably adapted for its intended purpose."—*Carpenter and Builder.*

"A very useful volume."—*English Mechanic.*

"Thoroughly practical and up-to-date."—*Irish Builder.*

"Of the utmost value to the student."—*City Press.*

**SANITARY INSPECTORS' and PRACTICAL** SANITARY SCIENCE EXAMS. of THE SANITARY INSTITUTE. Complete Courses of Instruction by correspondence for these and similar exams. conducted by Gentleman (Engineer, Surveyor, and Sanitary Inspector to Urban District Council) holding three Certificates from San. Inst. 1st Class Honours Medallist, Hygiene, &c. Several hundred successes. Classes for 1899 EXAMS. just commencing.—Apply early for Syllabus of Subjects, &c. to MEM. SAN. INST. Box **195**, Office of "The Builder."

**SANITARY INSTITUTE EXAMS.** — Preparation for the Inspectors' Examination under a system of correspondence needing no Text Books or Acts, by C. H. CLARKE, Assoc.San.Inst. Member of the Société Française d'Hygiène. 1st Honoursman and Medallist in Hygiene, Member of the Society of Arts, Professional Lecturer on Sanitation. Clarke's methodical and reliable "Aids":—"Notes on Sanitary Law," 1s. 6d. "Sanitary Appliances" (diagrams), 1s. "Trade Nuisances," 6d. "Practical Drain Inspection," 6d. "Calculation of Cubic Space," 1s. —Prospectus from 120, Thorold-road, Ilford, E.

**R.I.B.A. EXAMS. — PREPARATION** personally or by correspondence, in three, six, nine, or twelve months' courses. ARCHITECTURAL LENDING LIBRARY. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE & BOND, Associates R.I.B.A. Perchard House, 70, Gower-street, W.C. (close to the British Museum).

**R.I.B.A. SOCIETY of ARCHITECTS,** and CIVIL SERVICE TECHNICAL EXAMINATIONS.—PREPARATION by correspondence, personally, or in residence. Seventeen first places. Articled pupils and improvers can also be taken, premiums being required.—MIDDLETON & CARDEN, 19, Craven-street, W.C.

**MUNICIPAL and COUNTY ENGINEERS'** EXAMINATION.—Mr. RICHARD PARRY, A.M.I.C.E. F.S.I. &c. 27, Great George-street, Westminster, prepares pupils by correspondence for this examination. The course of work may be taken to extend over three, six, or twelve months according to previous knowledge. At the examination of last April out of the 15 successful candidates 12 were prepared by Mr. Parry.

**YOUNG ARCHITECT (A.R.I.B.A.)** ASSISTS in the PREPARATION of DRAWINGS, TRACINGS, &c. at his own office.

G. SCORER,
No. 28, Newman-street, W.

**TO ARCHITECTS, BOROUGH SURVEYORS,** &c. — Quantities expeditiously prepared (from unfinished drawings if urgent) by qualified Surveyor, in good London style. Special terms arranged. Specifications written. — Address, G. H. I. 26, Bernard-street, Russell-square, London, W.C.

**TO ARCHITECTS. — An experienced** QUANTITY SURVEYOR is desirous of meeting with an ARCHITECT who would be able to INTRODUCE BUSINESS upon MUTUAL TERMS.—Address, Box **123**, Office of "The Builder."

**STATIONERY and ACCOUNT BOOKS** FOR ALL CLASSES. Best for ARCHITECTS. Best for SURVEYORS. Best for BUILDERS. Best House for Tracing Papers, Tracing Linen, and Drawing Papers. The "Bedford Row" Tracing Cloth. Special Value. Send for Sample and Price Lists.—F. CORSE, Bedford-row Stationery Warehouse, Theobald's-road, London.

**JUNIOR PARTNER WANTED in an old**-established and large general practice in the provinces. Exceptional opportunity for a gentleman of ability and energy.—Box **214**, Office of "The Builder."

**CIVIL ENGINEER and ARCHITECT** (F.R.I.B.A.), with twenty-two years' service with the Government of India, and holding Certificate of Competency to act as District Surveyor in London, desires ENGAGEMENT, or would join firm of civil engineers or architects, with a view to partnership. Varied experience. First-class testimonials.—Address, F.R.I.B.A. care of Messrs. Grindlay & Co. 54, Parliament-street.

**JUNIOR PARTNERSHIP.—A.R.I.B.A.** (30) with good practical experience in town and country desires to PURCHASE a WORKING PARTNERSHIP in an architectural practice. London preferred.—Box **112**, Office of "The Builder."

**OFFICE TO BE LET. Central position,** City. Splendid light. One room, with use of large assistants' room if required, Suitable for architect starting practice. Cheap.—S. T. care of Street and Co. 30, Cornhill, E.C.

**BECKENHAM URBAN DISTRICT COUNCIL.**

TECHNICAL INSTITUTE, SWIMMING BATHS, AND ELECTRIC LIGHT STATION.

APPOINTMENT OF TWO CLERKS OF WORKS.

The Beckenham Urban District Council invite APPLICATION for the Offices of CLERK of WORKS, in connection with the Erection of
(1). A Technical Institute and Public Swimming Baths and
(2). An Electic Light Station.

The respective salaries will be as follows:—

For the Technical Institute and Baths Four Guineas, and for the Electric Light Station Three and a Half Guineas per week, the appointment in either case being terminable on one month's notice.

Applications, stating age and qualifications, accompanied by three recent testimonials, to be enclosed in an envelope endorsed "Clerk of Works," and addressed to Mr. J. A. ANGELL, the Council's Engineer and Surveyor (under whose direction the persons appointed will be required to act), and delivered not later than MONDAY, JUN 19th, 1899.

By order,
F. STEVENS,
Clerk of the Council.

May 29th, 1899.

**TEMPORARY ASSISTANCE.**

The Llandudno Urban District Council require the SERVICES of a TEMPORARY ASSISTANT to their Engineer and Surveyor.

His duties will consist in taking levels and preparing plans for works of private street improvement, and preference will be given to one having had experience in this branch of work.

Applications, stating age, and accompanied by copies of not more than two recent testimonials, endorsed "Temporary Assistant," must be received by the undersigned not later than MONDAY, the 12th day of JUNE, 1899.

The period of appointment will probably be for six months, and the salary offered is two guineas per week.

E. PALEY STEPHENSON, Assoc.M.Inst.C.E.
Engineer to the Council.

Church Works,
May 30th, 1899.

**QUANTITY SURVEYOR WANTED,** competent to measure extras and omissions and adjust accounts.—Give full particulars as to age, experience, and salary required, VALLANCE & WESTWICK, Architects and Surveyors, Mansfield.

**ESSEX COUNTY COUNCIL.**

ASSISTANT TO THE CHIEF SURVEYOR.

APPLICATIONS are invited for the APPOINTMENT of JUNIOR ASSISTANT in the office of the Chief Surveyor to the County Council of Essex.

Applicants must have had previous experience in the office of a County Surveyor, and must be capable draughtsmen and well up in bridge details.

Commencing salary 75*l.* per annum.

Applications, in own handwriting, enclosing copies of not more than three recent testimonials, to be sent to the Chief Surveyor, County Offices, Chelmsford, not later than SATURDAY, the 17th inst.

PERCY J. SHELDON, Assoc M.Inst.C.E.
Chief Surveyor.

County Offices, Chelmsford,
June 1st, 1899.

**WALTHAMSTOW SCHOOL BOARD.**

WANTED at once, an OFFICER to Superintend General Repairs, at a salary of 150*l.* per annum.

The person appointed must be a good draughtsman, competent to draw up reports, specifications, and able to conduct correspondence and keep the necessary accounts and minutes of the Works Committee.

Applications on forms to be obtained from the undersigned should be sent in on or before the 10th JUNE next.

T. W. LIDDIARD,
Clerk.

School Board Offices,
High-street, Walthamstow,
May 31st, 1899.

**ASSISTANT REQUIRED (not under 25)** for the Diocesan Technical School in Sierra Leone. Christian. Abstainer. One who has had practical experience in building construction or land surveying, in addition to ability to teach subjects underlying same.—Address, stating full particulars, to Box **264**, Office of "The Builder."

**ARCHITECTURAL ASSISTANT.**

WANTED a TEMPORARY ARCHITECTURAL ASSISTANT. Must be thoroughly competent to take out quantities, and to prepare detail drawings and specifications, for public buildings.

Applicants should state age, experience, and salary required, and give references.—COUNTY SURVEYOR, County Hall, Lewes, Sussex.

**DRAUGHTSMAN WANTED, thoroughly** experienced in preparing plans of shopfittings and fronts in perspective and to scale. Must be a good colourist and designer.—Apply, stating qualifications, salary required, and references, Box No. **232**, Office of "The Builder."

**ASSISTANTS (two) WANTED at once by** a firm of Architects in the Midlands, one to be leading assistant.—State age, salary required, and references, to Box **283**, Office of "The Builder."

**ARCHITECTURAL ASSISTANT Wanted** at once. Thoroughly competent.—State age, experience, and salary required, VALLANCE & WESTWICK, Architects and Surveyors, Mansfield.

**ARCHITECTURAL ASSISTANT** REQUIRED in a large Midland town. Experienced in construction and detail. Must be a quick and reliable draughtsman, and capable of taking a leading position. — Reply, with age, salary, qualifications, &c.—Box **291**, Office of "The Builder."

**ASSISTANCE WANTED in designing** decorative tile work.—Address, No. 133, CASTLE, LAMB, & STORR, 133, Salisbury-square, Fleet-street, London, E.C.

**CAPABLE MAN, experienced in designing** and building portable structures, &c. WANTED for fitting department (structures) at works.—Apply by letter, STRUCTURES, care of Street Brothers, 5, Serle-street, W.C.

**YOUNG MAN WANTED in an Estate** Office, who has just served his time in Architect's Office. Must be capable of preparing plans and specifications for the erection of farm premises, stables, cottages, &c. Shorthand writer preferred. Good references.—Box **285**, Office of "The Builder."

**PUPIL.—Firm of Architects & Surveyors** holding good appointments in south-coast town have VACANCY in office for PUPIL. Moderate premium.—Address, Box **282**, Office of "The Builder."

**AGENT, calling on Architects and** Engineers, WANTED, to push a patent sanitary appliance.—Box **104**, Office of "The Builder."

**TRAVELLER (young) WANTED, with** knowledge of Builders' Merchant's trade.—Apply, stating age, experience, and salary expected, to Box **244**, Office of "The Builder."

**WORKS MANAGER. — Energetic and** experienced Man WANTED (aged about 40) to take the entire management of a steam joinery works. Must have held similar position and have good references.—Address, giving all particulars and salary required, to Box **286**, Office of "The Builder."

**BUILDER'S OUTSIDE MANAGER and** ESTIMATING CLERK WANTED, about 40 miles from London. Must be well up in quantities and adjusting accounts. None but really energetic and capable men need apply. Copies of three testimonials required. — Apply Box **281**, Office of "The Builder."

**HEATING ENGINEER'S CLERK,** aged 18 to 20, WANTED. Must have some experience in drawing and tracing.—Address, Box **107**, Office of "The Builder."

**BUILDER'S CLERK WANTED, well up** in jobbing accounts.—Address to E. WIGLEY, 313, Railton-road, Herne Hill, S.E.

**CLERK.—WANTED in a large Joinery** Works in the country, a thoroughly competent PRIME COST CLERK.—Address, Box **280**, Office of "The Builder."

**BUILDER'S CLERK WANTED, with** some practical experience of time-sheets, prime costing, and general office routine. Good references necessary. Age between 20 and 30. Salary from 20s. to 30s. Permanent position.—Write, COOPER & SON, Ltd. Builders and Decorators, Windsor.

**BUILDER'S SECOND CLERK Wanted,** London firm, to check accounts, abstract time and materials, and general routine.—Apply, stating age, wages, references, &c. to Box **297**, Office of "The Builder."

**JUNIOR CLERK WANTED for a few** months (aged 16 to 18 years) for Jobbing Builder's office to enter time and material, &c. Hours 6.3 to 6.—Apply by letter, with particulars, salary, &c. t W. J. S. 273, Clapham-road S.W.

## *Bow Church Restoration.*

> "And Frenche she spake ful fayre and fetisly,
> After the scole of Stratforde atte Bowe,
> For Frenche of Paris was to hire unknowe."
> CHAUCER'S "Canterbury Tales."

ON Monday next, the 12th instant, the ancient Parish Church of Bow is to be reopened for public worship by the Bishop of London. Our readers may remember that in 1896 this church had to be closed on account of its dangerous condition, and that a proposal was then made that it should be demolished.

The origin and date of erection of the existing church is a matter of dispute, but credence is most generally given to the account recorded by Newcourt. In the year 1311 Bishop Baldock granted the inhabitants of Stratford and Old Ford a licence to build a chapel in the King's highway, on account of the distance of their abodes from their parish church at Stepney, and the impassability of the roads during the winter floods. Judging, however, from the architecture of the church, it appears certain that no part of the existing building is of earlier date than the latter end [illegible] the fifteenth century (1480-1490), and although there is a complete absence of documentary evidence as to the building of a new church at this date, there is very little doubt that the chapel which existed on the site from 1311, or a few years later, to about the year 1480 was then replaced by a new structure, of which the chancel, the lower part of the tower, the lower portions of the aisles, and possibly the roof of the nave still remain. The nave, which consists of a stone arcading (now covered with plaster and paint), with plain octagonal shafts, is evidently of a still later date. Probably both the nave and the north aisle were built in the middle of the sixteenth century, and the south aisle has been entirely rebuilt during the present century.

Sir Walter Besant, in his historical work entitled "London," writes:—"He, for instance, who walks along the broad highway of Whitechapel and Mile End, if he continues his walk, presently arrives at a most interesting and venerable church. It is quite small, with a low tower; it stands in the middle of the road and has a long, narrow churchyard, cigar-shaped, before and behind it. This is the Church of St. Mary, or Bow Church. It was formerly the church of a nunnery founded at Stratford-le-Bow by William the Conqueror; it was augmented by Stephen, enriched by Henry II. and Richard I., and lasted till the Dissolution." It is evident in this account that the history of a nunnery which existed at Stratford, or at Barking, upon the Essex side of the River Lea, has been confounded with that of the church of Stratford Bow which is situated upon the Middlesex side.

Lysons, in his "Environs of London," gives several illustrations of Bow Church and its neighbourhood, and in the copy in the Guildhall Library several additional drawings, some of them coloured, are inserted. One very badly executed drawing shows the church as it existed in 1754, while others represent the church in 1826, and as it appeared "before the alteration in 1794," and at other periods. The illustration of "Bow Church in 1800," from a painting of that date, shows also the ancient Market House, said to have been erected in the reign of Henry II. and not more than six to eight yards from the east end of the church. It was in a room over this market that the school founded by Sir John Jolls (or Jolles), about the year 1613 found accommodation. The ruined remains of the old mart existed until about 1835, when the site was utilised as a burial ground. Other illustrations represent the old font, which may still be seen in the church; the armorial bearings of some of the families formerly resident in the neighbourhood; and the burning at the stake of thirteen persons in this parish in 1556 for what was then deemed heresy. This latter event is now believed to have occurred in Stratford, and not in Stratford Bow.

In 1883 Sir Arthur Blomfield prepared a design for rebuilding the whole of the church except the fifteenth century tower and the modern organ chamber. In this design increased accommodation and new vestries were provided, but owing to lack of funds the scheme was eventually abandoned. About the year 1887 a modern gallery, which partly concealed the west window, was removed, and the high-backed pews were cut down, but no serious attempt was made to deal with the structural defects until in October, 1896, a portion of the chancel roof subsided, and it became necessary to close the church.

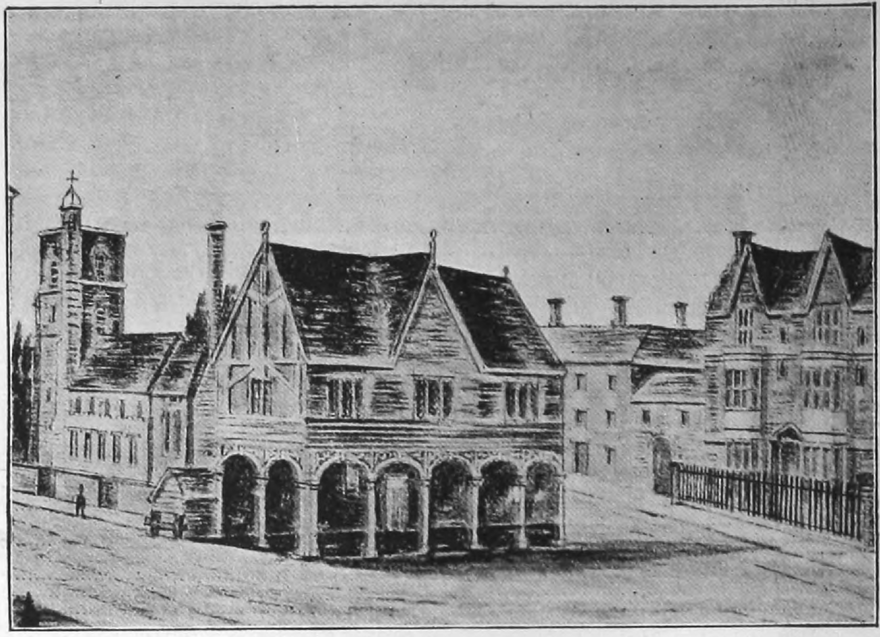
A Restoration Committee was then formed, and ultimately the joint efforts of the Committee for the Survey of the Memorials of Greater London, the National Trust for Places of Historic Interest or Natural Beauty, the Society for the Protection of Ancient Buildings, the Bishop of Stepney and other gentlemen resulted in the collection of sufficient funds to commence the much-needed repairs. In carrying out the present restoration every effort has been made to repair well and substantially without making any marked alteration in the appearance of the edifice.

The name by which the church was formerly known, viz., "The Chapel of St. Mary, Stratford atte Bowe," was probably derived from the proximity of the church to the bridge "arched like unto a bowe," which was built by Matilda, Queen of Henry I., over or near the straight-ford across the River Lea. The church remained a chapel-of-ease to Stepney until 1719, when it was consecrated as the parish church. John Stow, in his "Survey of London" in 1598, records that "there was an ancient custom for the inhabitants of this town of Stratford-at-Bow to go in procession to the Church of St. Peter, Westminster, all through the City of London, at Whitsuntide, in token of some dependence of this town upon that church. This they got themselves released of, in the days of Henry the Eighth."

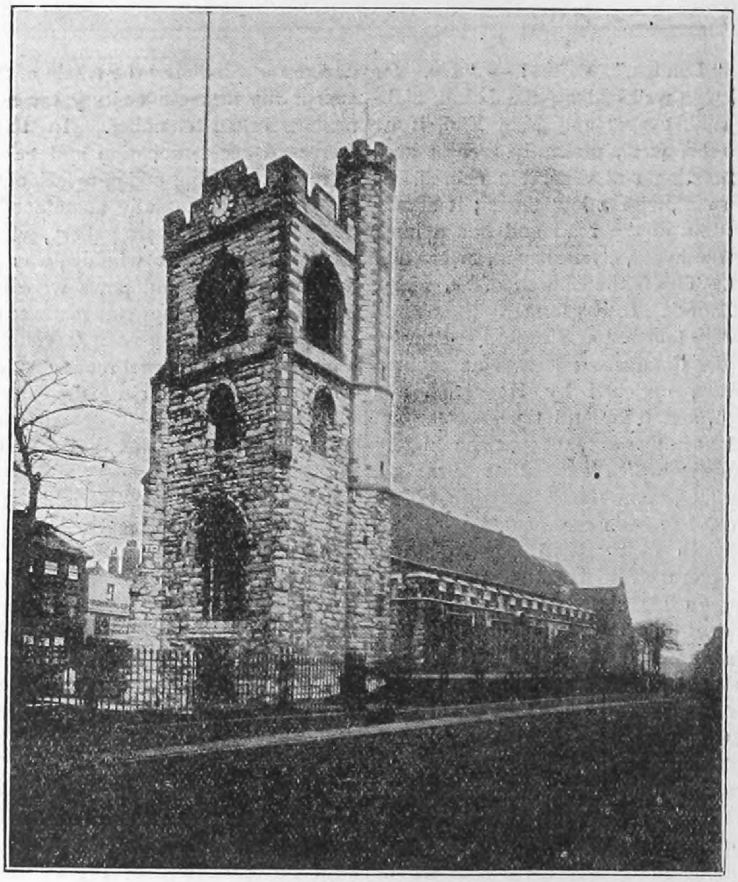
Erected in the great main road* leading

---

* Until the present century the road on the south side only of the church appears to have been used for vehicular traffic. An old oil painting now in possession of Mr. O. C. Hills of Bow shows the road on the north side stopped by a wooden barred gate.



*Bow Church and Market House in 1800 (from an Old Painting).*



*Bow Church in 1899.*

from London to Romford, Colchester, and Harwich, this church has always been a notable object, and has attracted the attention of several historians and artists. Incredible as it must appear to the visitor of to-day, the parish of Bow was, within the memory of living residents, a rural village, with wealthy families living in the neighbourhood and residing in spacious houses surrounded by meadow land and cornfields. The *Mirror*, as recently as 1825, remarked that "there are few places in the vicinity of London which are more interesting from the evident marks of antiquity that are displayed in and about them than the village of Bow, or, as it is commonly termed, Stratford Bow, in the county of Middlesex.

"The village itself seems originally to have derived its importance first from an ancient ford near one of the Roman highways, and, secondly, from a bridge of one arch over the River Lea, built by Henry I., probably at the instance of Matilda, who, as it is stated, in attempting to pass the ford "got well washed in the stream" (*vide* Leland). The church itself is not of great architectural interest, although the west window and doorway in the tower are well worthy of notice; but it may be said to represent a correct specimen of second-rate ecclesiastical architecture of the fifteenth century period. The chancel gable, with its tiled roof, took the place of a flat roof in 1755. The upper portion of the tower, which the eye at once detects as work of recent date, was added shortly after the year 1829, when a portion of the upper part of the tower as it then existed fell down during the night. About 1840 the flat plaster ceiling of the nave and the window curtains were removed, and the old oak roof was exposed.

The opinion has been expressed that the spread of the walls is due entirely to the removal at the latter date of the ceiling joists, which it is thought acted as effective ties; but the architects do not hold this view, as in their opinion the defect is of far longer standing.

The restoration works, which have just been completed, may be summarised as follows:—

*The Chancel.*—The gable roof of 1755 has been practically renewed and the brick gable rebuilt, but the old timbers are left, although they now do no work. The fifteenth century roof, as seen from the interior, remains unaltered. The walls have been rejointed with tiles and flints, and a little new Portland stone inserted.

*The Nave.*—Practically a new roof has been provided, although some of the old timbers have been re-used. Double oak windows have also been added to lessen the nuisance created by the clamour of the heavy traffic which passes within a few feet of the church windows.

*The North Aisle.*—A new doorway to the modern vestry has been formed, and the wall has been repaired in the same way as the chancel.

*New Work.*—The old red brick vestry has been extended to embrace a choir vestry and entrance lobby.

The tower is now the only part of the church remaining to be repaired. Some 3,700*l.* have already been spent on the restoration, about 1,000*l.* of which have still to be collected, while another 1,000*l.* are required for the tower. It is earnestly hoped that this sum of 2,000*l.* will be publicly subscribed, as otherwise the most interesting portion of the building must be allowed to become a ruin.

The restoration has been carried out by the local architects, Messrs. Walter A. Hills & Son.

For the present the historic little edifice has been snatched from the destroying hand of the Vandal; and the new century upon its advent will find the same old landmark, whose weather-beaten form has for so many ages stood conspicuous in the great highway, still occupying its accustomed place. Its present aspect is indicated in the accompanying illustration.

## ARCHITECTURE AT THE ROYAL ACADEMY.—III.

### DOMESTIC ARCHITECTURE.

THERE is a pretty good proportion of domestic architecture in the Architectural Room at the Royal Academy, though there is no design for any mansion of the largest class. We may divide the exhibits, however, into the larger country houses which aim at a certain degree of dignity, and those smaller ones in which the general aim (at present at all events) is to be picturesque and piquant.

Among the larger houses we first come on two by Mr. Leonard Stokes, "Cold Ash, near Newbury" (1,616) and "No. 2, West

Drive, Streatham Park" (1,622), though no one at first glance would suppose they were by the same architect, so totally different is their character and treatment. "Cold Ash" seems to owe something to suggestions from the modern American type ot country house, in which there is a kind of affectation of simplicity, a cottage character given to a house on a large scale; a verandah on bare poles, with a thick battered retaining wall under it. The author sets a good example in giving both a plan and a compass, which, however, unfortunately shows that both kitchen and dining-room have an aspect towards the west—bad for both cook and diners on hot summer evenings. The Streatham Park house, with a plan but no compass, is one of the substantial square order, with large rooms, and is a much more satisfactory work in style than the other; it gets great dignity from its very boldly projecting cornice, and there is an original and effective architectural treatment of the chimneys, which are combined into one great stack in the middle of the roofs, or, more properly, two stacks which are architecturally connected by a special "treatment." It is surprising that one does not see more attempts made in modern houses to do something with the chimneys, instead of leaving them so many excrescences sticking up all over the design, as in Mr. Prentice's "Cavenham Hall, Suffolk" (1,624, 1,634, 1,684), where they quite spoil the house, which is in itself a nice quiet type of archæological work, though there is nothing either in the plan or the design to justify the hanging of three different views of it, a favour obviously due to the author's picturesque and effective pen-drawing; for the architectural room is much more an exhibition of architectural drawing than of architecture. The plan of the house is too rambling and uncertain in method for our liking (though such rambling plan is popular at present). We observe that, as in several other house plans in the room, the kitchen window is on the wrong side of the cooking-range—or the cooking-range on the wrong side of the window, whichever way you like to put it; the cooking-range ought to have a left-hand light; it is surprising how few architects seem to be aware of this. The materials appear to be brick walls with large spaces of roughcast or other whited surface, as far as one can gather from the drawings. The effect of the square forecourt with the circular drive would be good.

Mr. Wornum's "Las Fraguas, Santander, Spain" (1,630) shows no plan, and is merely a view of a house with ordinary English detail, about which the only element of surprise would be to meet with it in Spain. Mr. Mackenzie's slight sketch of "The new clock tower, Fyvie Castle" (1,657) shows a pleasant bit of modern Scotch Jacobean; and from this we pass on to Mr. Leiper's "Staircase and Gallery, Kelly House" (1,745), a coloured sectional drawing showing a solidly wainscotted gallery with some stained windows well put in, and an equally solid wood staircase with an arcade carried on rather massive polished columns; from the colouring this seems to be of wood, but if so, it is distinctly a wooden imitation of stone architecture. However, this is a type of drawing one is glad to see in the architectural room, and of which there ought to be more, in place of so many mere pictures. Mr. John S. Lee's "Design for a Garden by a River" (1,751), a palatial Italian garden, is another geometrical drawing, on a small scale but with a good deal of interest, showing a circular *bassin* with balustraded staircases winding up on each side to a terrace; the square pavilions at each end of the terrace, placed cant-wise, so that the balustrade runs up to their angles, have a piquant effect, but are not quite in keeping with the severely Classic mode of the remainder of the composition. It is an easy step from this geometrical drawing of a classic garden to Mr. Vigers's perspective drawing of an English house and garden (1,818), where the garden, backed by a landscape, is really the principal object of the drawing; the house occupies a small portion in the middle distance of the picture —a plain red-brick house with a red-tiled roof and an octagon bay at one angle. The garden is shown and coloured with great delicacy and minuteness, in a partially birds-eye view from a high standpoint; next the house a terrace with coloured *parterres* and clipped trees, with a brick sunk fence giving on a wide square lawn, ending in a deeper brick *revêtement* wall with flying steps on arches leading down into the field in the foreground. Flanking the grass-plat on the left is the kitchen garden, amid massive box hedges, in the corresponding position on the right the flower garden. This is a very delicate and highly-finished drawing, and worth careful examination. Mr. Ferguson's "Garden House, Fairlawn, Kent" (1,822) is interesting as a specimen of the old-fashioned pompous Classic stone conservatory with an order, shown in an effective drawing. Mr. Pryce's "Ifield Wood, Sussex—enlargement of an old farm-house" (1,840) and Mr. Bedford's "Dalguise Harrogate" (1,841) both make picturesque views of house and garden; the latter is a mere picture, without a plan. Then we come to a drawing of a very different kind in Mr. Belcher's large and severe elevation of "House at Pangbourne—Garden Front" (1 854), a coloured geometrical drawing on rather a larger scale than was necessary to show the detail, of which in fact there is not very much, except in the pavement of the terrace, which is carefully shown on the plan of the front. This, again, is just the sort of drawing we like to see in the architectural room, though we should have thought the semi-octagon bays, on which the centre pediment seems to rest, would have been none the worse for a little more dignified treatment than is afforded by the mere thin coping which is its only finish; but that excessive plainness also is a taste of the day, and is no doubt more wholesome than the excess of ornament from which it is a reaction.

Among the smaller class of country houses and houses of the cottage type, if of more than cottage size, we find a general character prevalent—that of a certain rural simplicity, an absence of anything like architectural pretension, which is perhaps a little too conscious—it is the note of the day. Messrs. Niven & Wigglesworth's "Hillington, Walton-on-Thames" (1,611), with its three equally-spaced circular bays exactly alike, is somewhat an exception, a little more symmetrical and formal than most; there is no plan, and therefore we cannot form any idea of the relation of these bays to the interior arrangement. Nor is there any plan of Messrs. Brewill & Baily's "Apsley Heath" (1,612), which in fact is about as destitute of interest as a drawing can be. Mr. Reynolds's "Design for a Country House" (1,631) looks at first sight more like a country church, the windows of the "gallery" suggesting a side aisle; the large mass of the chimney, a plain unadorned erection of battered walling, contradicts the church idea; and there is a plan—a rather crude one, where again we see the kitchen window and fireplace wrongly arranged. It is a picturesque bit of drawing, however, and as such is probably hung. The plans of "Sunnyside, Holmwood" (1,633), by Mr. W. T. Barlow, are given; neither plan nor design have any marked character. Then we have two sets of stables; Mr. W. A. Pite's "Stables," Highcombe Edge, Hindhead" (1,652), a couple of little line elevations with a good deal of character, and Mr. Horsley's "New Stables, Whitley Hall" (1,656), a building exactly like an old sixteenth century farm house of ⊓ plan, pleasing enough, but a little too like "an antick" (antique), as Edie Ochiltree phrased it. A plan is given here; none is appended to Mr. C. J. Blomfield's house near Abingdon, another bit of antique in a different manner. Mr. Arnold Mitchell's "Small house at Rickmansworth" (1,724) is an antique of yet another type, the half-timber gable cottage; it probably looks more attractive in the admirable drawing than in reality. At last, in Mr. Voysey's "House at Windermere" (1,725) we come on something with original character; it is in that whitey-green combination which Mr. Voysey has invented; here also are three semi-circular bays, treated with a distinctive character; the middle one, representing the hall, differentiated from the other two by being glazed all the way up, while the others are divided into two stories. We suspect that these houses of Mr. Voysey's also owe something in effect to the drawing; but at all events there is character here which is not obtained merely by imitation of old work. Mr. Marriott, in "Proposed House at Limpsfield" (1,780), plans and elevation on grey paper with the upper part of the elevation whited to represent plaster (a rather cheap means of getting effect in a drawing), has produced a pleasing and simple design of cottage type, and has the merit of giving his plans the same importance as the elevation; unfortunately the plan is not altogether happy, for kitchen and drawing-room windows both have the same aspect; there is no compass to show what it is, but every architect ought at all events to know that what is the right aspect for the kitchen must be the wrong one for the drawing-room. "A Country Home," by Mr. F. Forbes Glennie, is a sheet of elevation and plans, of which the former are rather commonplace; the "gallery" in the plan, between dining-room and drawing-room, is a good point. Messrs. Hall, Cooper, & Davis's "Four Houses at Scalby, Yorkshire" (1,791), is really a terrace, treated with some originality; the prominent features are two large projecting square bays each of which contains in its ground story the porches of two of the doors, recessed; in other respects there is original character in this design, which at least avoids the commonplace of the ordinary terrace. In Mr. Baillie Scott's "Le Nid" (1,823) we have an interior of real charm; a coloured draw-

*d*

ing showing a room in a house which is treated with white, light blue, and a delicate warm yellow, as the prevalent colours; at the back of the room, up two steps, is a small oratory, divided off by a railing, and with its altar and stained-glass window; over the opening, on the frieze, are the words:

> "We two will stand before that shrine
> Occult, withheld, untrod."

There is a touch of real poetry about this interior which it is refreshing to meet with.

Street houses form another class, of which there are a few good examples. There is one point in which street architecture differs in its conditions from the architecture of houses standing in a free space, and which is often rather lost sight of, viz., that it is much less easy to see the actual building as you see it on paper, when it stands in a street, unless the street is an unusually wide one. A country house can generally be seen, in reality, as it seems to the eye on paper. In a street elevation the lower portion, in the actual building, is generally much more prominent to the eye than the upper portion, which is only seen foreshortened. The natural conclusion would be that detail and decorative treatment should be concentrated on the lower rather than the upper portion of the front, though the reverse treatment looks better on paper. This consideration does not preclude, however, the introduction of a large and rich cornice, provided it be designed so as to present a good appearance when seen from below. We do not know that any designs in the Academy room specially illustrate this point, one way or the other; but it is one that is worth bearing in mind. Among the street architecture designs is one of Mr. Greenslade's small and delicate elevation studies (1,610), which is very refined and very suitable for a street, and would perhaps be still better without certain little bits of rather unnecessary ornament which occur on it. Mr. Batterbury's "Stone Front, 233, Strand" (1,643) is an example of a solidly treated shop front. Mr. Jaggard's "A Town House" (1,673), a design which, if we remember right, has appeared in our pages, combines a solid appearance with a flat treatment of detail which is suitable to the situation. The most important piece of street architecture in the room is Mr. Belcher's "New Premises, Hanover-square" (1,727), a large square front treated with the conventional Corinthian pilaster in the upper portion, with the conventional cornice and attic over it; what gives distinctive character to it is the very effective and graceful manner in which sculpture is introduced above the first-floor windows, making a broad band across the front, and the way in which the treatment of the windows is varied so as to give interest and change but without departing from classical symmetry and repose. Mr. Beresford Pite's drawings of three house fronts, one in Bond-street and two in Harley-street, do not show very well where they are hung; every one knows they are good work. Mr. Ravenscroft's small elevations of brick street houses for a London suburb (1,847) are in very good taste; whether placing the ground floor groups of windows out of centre with those above is an advantage may be questioned, but it is justifiable if it arises out of the planning. Messrs. Wimperis & East's "Proposed rebuilding of London newspaper offices" (1,620), on a front with a concave curve, gets a good effect from the projecting pavilions at each end of the curve, which flank the general line of elevation and form a stop to it; and Mr. Harold Cooper's "Exterior, 16, Stratton-street" (1,764), is a good piece of plain but characteristic building. Mr. Powell's "Addition to Premises, East Grinstead" (1,621), seems to have been hung simply for the drawing, which is a clever one in coloured crayon, but has absolutely nothing in it architecturally, consisting chiefly of shop blinds and awnings; and Mr. Quennell's "Entrance to house in Rosecroft-avenue, West Hampstead" (1,688), a line drawing in a quasi-antique style, comes under the same class; there is nothing in the design, it is simply a bit of very clever drawing. These two drawings are rather emphatic illustrations of the extent to which drawing, and not architectural thought, influences the choice of things for the architectural room.

In our next and final notice we shall have something to say as to the drawings of decorative design.

◆

## NOTES.

**Birthday Honours.** THE conferring of the honour of Knighthood on Mr. Alma-Tadema will meet with universal approval, but that is the only recognition of any kind which is bestowed upon art. As usual, and as has been the case for many years, the art of architecture, to which the country owes the decoration of its cities, is entirely ignored; indeed, one might suppose that to the persons—whoever they are—with whom really rests the responsibility of selecting candidates for titular honours, the existence of architecture and of architects is unknown. The engineers, it appears, are looked upon with more favour, and Mr. Preece receives a K.C.B. Few men have done more than he has to popularise science, as a lecturer; as an author he is best known by his text-book of telegraphy, which he wrote in collaboration with Sir James Sivewright; and he has contributed some eight or nine papers to the Royal Society, and numerous papers to the Institutions of Civil and Electrical Engineers and to the Physical Society. No one will find fault with his selection as an engineering representative. What we do find fault with is the entire and almost inexplicable ignoring, year after year, of the architects.

**The London Building Act.** THE Queen's Bench Division of the High Court of Justice has decided that a public-house does not come under Section 74 of the London Building Act. That section requires that when a building is used in part for the purposes of trade or manufacture, and in part as a dwelling-house, these separate parts shall be divided by walls and floors constructed of fire-resisting materials. The decision of the Court seems clearly right. It was urged on behalf of the owners of the public-house that no line could be drawn between the part used as a public-house and the part used as a dwelling. This is true, especially as it has to be borne in mind that the entire building is licensed. It may also be doubted whether the section was ever intended to apply to public-houses, which are only private houses where alcoholic drinks may be bought or consumed. However, be that as it may, this case of Carrick *v.* Godson & Sons has placed the matter beyond doubt, and to have any question upon which any feeling of uncertainty exists in regard to the Act set at rest is very desirable. Whether, however, much more stringent regulations in regard to the area, plan, &c., of public-houses are needed is a matter for discussion. The sanitary condition of many public-houses outside London is not what it should be.

**Appeals on Workmen's Compensation Act.** THERE are fifteen appeals already entered for hearing under this Act for the present sittings, and the number is sure to be increased from week to week. This is an unprecedented circumstance in regard to a single statute, and shows the great amount of litigation which this Act of Parliament has produced. The fact does not necessarily mean that the Act has not produced satisfactory results, taken as a whole; but it certainly does mean that it was badly drafted and has produced a great deal of litigation which ought to have been avoided. It is too much the tendency of Parliament at the present time to formulate rules of conduct very indefinitely in statutes, leaving it to the public and the Judges to make what they can of them. The Legislature vaguely lays down its intentions instead of formulating them with precision.

**Early Remains found at the Tower.** BY the courtesy of the authorities we have been enabled to see the remains that have just been discovered in laying foundations for a new guard-house (on the same site) at the Tower, Messrs. J. & M. Patrick, of Wandsworth, being the contractors to the War Office. The former guard-house was built in 1827 to replace the "Stone Kitchen," which had been fitted up in the Stone House—at one time the Spanish Armoury—situated between Coldharbour and Wakefield (or Hall) Towers, in the latter of which the Regalia is now kept. Coldharbour Tower, a gateway flanked by two drum towers,* within the Inner Ward, stood close by the south-west angle of the Keep, or White Tower. Some 9 ft. or 10 ft. below the present raised surface, and about 18 ft. south-west from that angle of the Keep, have just been found (together with human bones) some Roman masonry, and sections of squared hot-air flue-pipes, belonging, it is conjectured, to a building of no small importance. In one fragment the bonding tiles, laid in courses, are remarkable as showing, a-piece, a section of three layers—an inner streak coloured dark-blue, between two streaks coloured red. In a line with the Keep's western wall, and about midway towards the Wakefield Tower, is now disclosed a well, 90 ft. deep and about 5 ft. in diameter. The early twelfth-century masonry consists of rubble steined down to 15 ft. below the water level with Gatton ashlar—the firestone which was so largely used for dressing of the Kentish rag in the older portions of the Tower. To that date, too, is ascribed the curtain wall, mostly of rag, chalk, and rubble (and now exposed to view) extending northwards from the Wakefield Tower. That curtain wall was afterwards included in the Stone House, and against its western, or outer side, was built a picturesque row of gabled and bow-windowed houses with red brick chimneys and tiled roofs, the "Seven

Houses of Office," which are cited in the survey of 1532 as being then newly built, and were pulled down in 1827. The White Tower was built just within the Roman wall of London, of which a fragment may be seen at the base of the remains of the Wardrobe Tower, near the chevette at the south-east angle of the White Tower. We may add that it is expected the subway, wherein have been discovered iron and stone shot, mingled with portions of armour and human bones, will be found to communicate with the moat underneath the St. Thomas Tower ("Traitors' Gate"), where, in the east wall, are traces of an opening now closed up, and that the south side of Garden (or "Bloody") Tower, restored by Salvin, and which shows signs of decay, is being re-faced.

---

**Dundas Castle.** THIS estate, extending over 2,000 acres, near Queensferry and Dalmeny, is offered for sale by private tender. The present mansion-house was built in 1818, of Humbie stone, after the designs in the Tudor style of William Burn, of Edinburgh. The adjacent old castle crowns the extremity of the basaltic range, known as the Rock-walk, of Dundas Hill, and is approached by an avenue nearly one mile long, from the road that leads to Kirkliston from Queensferry. Having been converted into a distillery about eighty years ago, the interior was greatly altered. The original early fifteenth-century building had been erected under licenses granted by the Regent, Robert Duke of Albany, and his nephew King James I. to the house of Dundas, who had been settled there since the reigns of Alexander I. and his brother David I., in the earlier part of the twelfth century. The castle, which is L-shaped on plan, contains two rooms in each of its four stories, some of them vaulted, with an arched entrance (latterly cut square) in the re-entering angle. The now flat roof is gained by a circular staircase surmounted by a round turret carrying a beacon post and watch tower commanding an extensive view of the Forth and the castles around. A few years after the building of the castle an addition, carried up to the same height, was made at the north-west corner, for a kitchen and offices. The hall, measuring about 29 ft. by 20 ft., on the first floor, retains its ancient fireplace, with side putt-stones to withstand the thrust of the segmental arch above the hearth. The later garden, on the south side of Dundas Hill, was laid out, it is said, by Switzer during his visit to Edinburgh, *circa* 1717. The old garden, the delight of Sir Walter Dundas, who succeeded in 1583, has, together with its four summer-houses, long since been destroyed. But one interesting relic was preserved — the Renaissance fountain and sun-dial set up by Sir Walter in 1623, and illustrated in Mr. W. W. Fyfe's "Summer Life on Land and Water at South Queensferry," 1851. The fountain, of the district freestone, and richly sculptured with masks and in low relief, has a base 7 ft. square, is 8 ft. 3 in. wide at the water-troughs, and rises to a height of 7 ft. at the top of the cornice, to which there is an ascent on one side by a flight of steps; the dial-pillar rises to 5 ft. in the clear above the cornice. In the Latin inscription (much worn), Dundas commends his house and its gardens to the enjoyment of his friends, avers that to be content with ordinary things makes us even with the world, and concludes —"*potiora aliis non invidemus.*"

---

**Kensington Palace.** IN the Queen's Closet at Kensington Palace is hung an interesting set of paintings (removed there from the Queen's Presence Chamber at Hampton Court) of riverside and other views of London in the earlier years of last century. The pictures by W. James, which do not possess the artistic merits of Scott's similar views, show the Horse Guards and the parade ground, with Kent's Treasury Chambers, and Downing-street, from the north-west, by the old Gun-house; Denmark (or Somerset) House, with the Temple Gardens and water gate; the Savoy and Old Somerset House; the mouth of the Fleet with the Bridewell Bridge; York water gate and stairs, with the water-tower built in 1692; and Greenwich hospital and park, with Flamsteed's Observatory and St. Alphege parish church—designed by Hawksmoor, the steeple being by John James. There is another view of Greenwich Park and the Thames, perhaps by Danckers, with one of the Savoy and Somerset House which agrees in nearly every respect with James's picture. The chimney-piece in the room, a relic from Westminster Palace, bears in relief the Tudor rose, the arms of Queen Elizabeth, and her cipher, "E. R." The purchase of a guide-book is beyond the means of many who wish to see their sovereign's early home; but as most people can read now-a-days, we think that a little pains might have been taken to give gratuitously to the public—by way of affixed notices, or distributed leaflets—some particulars of the apartments and their contents, which the Queen has enabled them to see.

---

**The Dutch Gallery.** THE small and rather heterogeneous collection of pictures at the Dutch Gallery in Brook-street contains two or three small works of rare beauty, among which is pre-eminent a picture by M. Fantin-Latour, "Solitude," one of his beautifully idealised little woodland scenes, with one nude figure not too much emphasised to break the harmony of the whole; a little picture which is quite a poem in colour. His larger work, "Sara la Baigneuse," we like much less; it is comparatively commonplace, which certainly can rarely be said of this artist. Then there is a fine Forest of Fontainebleau scene by Diaz, a small study of a waterfall by Rousseau, and a very good moonlight scene by Jongkind. Mr. Fisher's "Spring" we have seen before, here or elsewhere (or one very like it), but not his "Bathers," remarkable for the colour and light on the water. The small Corots exhibited are mostly early works; the "View of Dunkirk" is interesting as being so different from Corot's usual class of subject, and a not very good specimen of Decamps takes us back to an earlier era of French art. The large sea-piece by Herr Mesdag, "A Threatening Night," is not in his best way, and the foreground waves are rather poor in treatment—commonplaces of sea-painting. As to M. Monticelli's daubs on each side of it, called "Sunset" and "Autumn," one does not know what art is coming to when such things are exhibited as pictures. But the small painting first mentioned, by M. Fantin-Latour, is alone worth a visit.

**The '91 Art Club.** THE club under this title is an association of ladies, who have held a small exhibition annually for three or four years, but only for a few days; and this year's exhibition, which opened on the 1st, is already closed. It would be worth while another time for the club to keep it open, say for a fortnight, and give people time to hear about it, for it is an exhibition containing a good deal of original work, and not (like some other ladies' art exhibitions) only consisting of what would not get a chance of exhibition elsewhere. Miss Anna Nordgren (the President) was one of the principal exhibitors, and among her eleven works was one, "Swedish Interior," of quite exceptional excellence. The best works exhibited were this and the "Sea Chase," a silvered bronze alto-relief by Miss Rope (Vice-President) who also had some other good exhibits. Among other works worth attention were Miss Bland's sketch "A Country Lane," Miss Hayter's "Early Spring," Miss Lloyd's "Portrait of Mr. Arthur Stewart," a masterful portrait to come from a lady's hand; Miss Birch's "Early Morning in Harbour," Miss Gore's "On the Ouse;" Miss Luxmoore's "Vivienne," a portrait of a girl with a violin; Miss Emily Duncan's "Burnham Beeches," a large landscape of considerable merit, and Miss Neumegen's study of an old woman under the title of "Mère Zon-bon."

---

**Mr. Helleu's Exhibition.** A COLLECTION of Mr. Helleu's dry-point etchings, together with a large-size pastel portrait and some crayon drawings, is on view at Mr. Dunthorne's gallery in Vigo-street. Of the etchings there is nothing new to be said; Mr. Helleu's work of this kind is well known in London now, and always displays the same mastery of dry-point line, the same freedom of style and certainty of drawing, in his various sketches, chiefly of ladies; also it must be admitted, the same entire absence of sentiment or feeling, a failing which gives a certain kind of vulgarity to his portrait sketches; not vulgarity in an artistic sense, of course—they are quite the opposite of that; but they seem like the portraits of persons with only the outside get-up of a lady without the reality. The pastel portrait is more pleasing in this respect than the etchings. It is announced that the artist is about to come to London for a time, and perhaps it may become a fashion for ladies to have their portraits "etched by Helleu," and no doubt such portraits will always have an artistic value; but they will not satisfy every one.

◆

## HIGH HOLBORN TO THE STRAND:

### SOME NOTES BY THE WAY.

As the London County Council are now acquiring, at an estimated cost of 569,000*l*., the property lying between Holywell-street and the Strand, and are carrying out, at an estimated cost of 162,000*l*., the widening of Southampton-row (east side) as sanctioned by Parliament last year, some historical notes on the sites affected may be of interest.

The two measures complement the entire project of the County Council as introduced this current session. The partially vacated area bounded by Drury-lane, Kemble (formerly Prince's), Stanhope and Blackmoor streets, 106,000 sq. ft., is being dealt with under the Council's Clare Market scheme, 1895; on the opposite side of Drury-lane is a cleared area traversed by Russell, Marquis, and Cross courts, about 79,000 sq. ft., which includes the burial-ground of St. Mary-le-Strand, and will be occupied, in part, by an enlargement of the theatre, together with a block of flats and shops, to be carried out, at an estimated cost of 15,000*l.*, by, we understand, Messrs. Pilditch & Chadwick.

We can, perhaps, best indicate the range and scope of the Council's project by stating that they seek for powers affecting property which extends to and includes (*a*) on the east, the entire west sides of Kingsgate-street, New Turnstile, Gate-street (south arm), and Lincoln's Inn-fields (Newcastle, or Powis, House, excepted); all Portsmouth and Clare-streets, with Bear-yard, Vere-street Board Schools, and Sheffield and Twining (formerly Gilbert) streets; most of Houghton-street; New Inn, Danes Inn, and a part of St. Clement Danes churchyard; (*b*) on the west, the east side of Southampton-row, a line drawn from south of Holy Trinity Church, Little Queen-street, to the north-east corner of the junction of Wild-court and Chapel-place; all Wild-court, with the Board Schools, Little Wild-street, and Sardinia-street; part of Kemble-street; all Queen's Head-yard, Chapel-place, and Sardinia-place (lately King's Head-yard); the south-west sides of Great Wild and Stanhope streets; all Blackmoor-street; the north-east side of Drury-lane as far as Marquis-court; the north-east side of Catherine-street (in part), with all White Hart-yard and Little Catherine-street; the Gaiety Theatre and Restaurant, and the *Morning Post* offices.*

The two crescents radiate from and absorb Craven-buildings, Maypole-alley, and the Olympic Theatre. They cover portions of Drury-lane, Newcastle-street (formerly Magpie-alley), and Wych-street; and all of New Inn and White Hart-street. There is little doubt that in the end will be taken the whole property within the curve, comprising the Opera Comique and Globe Theatres, the rest of Newcastle-street and Drury, Windsor (formerly Denham-yard), New Church, Angel, and Helmet courts, Strand. The new thoroughfare absorbs the whole of Denzell-street, it crosses Vere, Stanhope, and Sardinia streets, and its middle line runs nearly due south from between Southampton-row and Kingsgate-street to the end of Craven-buildings and the Olympic Theatre, almost parallel with, and distant 230 ft. from, the west roadway of Lincoln's Inn-fields. We will briefly notice a few of the places and sites affected by the Bill, whose preamble has been passed by the Committee.

Kingsgate-street marks the route taken by James I. to Theobalds, and by Charles II. to Newmarket. Southampton-row, on the Bedford estate, leading from Russell-square past the ends of Vernon-place and Theobalds-road, formerly King's-way, to High Holborn, recalls the marriage of Lord Southampton, Shakespeare's friend, to Elizabeth Vernon, and the building, *circa* 1660, for Thomas Wriothesley, Earl of Southampton, and Lord Treasurer, of Bedford, or Southampton, House, where is now the north side of Bloomsbury-square; John Webb being the architect. The house, wherein his daughter and heir, Rachel, Viscountess Russell, passed her second widowhood, was pulled down after its sale by auction in May, 1800. Holy Trinity Church was built (1831) on the sites of Nos. 6, 7, 8, Little Queen-street, and enlarged and improved in 1887, by Mr. C. Forster Hayward; one may yet see at the rear the garden of the house, No. 7, wherein, on September 22, 1796, Mary Lamb in a paroxysm of insanity occasioned her mother's death. In Gate, formerly Princes-street, opposite, is the smallest square in London, consisting of but one house, now rebuilt, which bore a tablet inscribed "Princes-square, 1736." Here we are on the ground once styled Le Spencer's Lond, and cross the track of the Spencer Dig or Ditch, that flowed from Drury-lane (via de Aldewych) to Holborn-hill. The land, once owned by the Templars, was granted to Hugh Le Despencer, who forfeited it on attainder in 1326, it was restored to the family by Edward III., and ultimately granted by Henry VIII. to Sir Walter Mildmay, founder of Emmanuel College, Cambridge. Some identify Spencer House with the "Bull and Gate" coaching house, which was taken in 1863 by the Pneumatic Despatch Company, lying behind the houses rebuilt as College-chambers in 1879. Yet a claim in that respect has been advanced for the premises, pulled down at intervals in 1884-6, which stood where are now Nos. 15-6-7, Great Turnstile and 283, High Holborn. That house, since sub-divided, contained an early Jacobean chimney-piece, and is said to have been the home of Richard Penderel the Royalist.

Inigo Jones laid out Great Queen-street along a path skirting the Pightells and Purse fields, and leading to the Devil's Gap, Drury-lane, where it entered White Hart-close. The ground belonged to the jointure of the "Rose and Lily Queen," Henrietta Maria, whose badges were fixed upon the house-fronts, as we still see them banded in stone on to the brick Ionic pilasters of No. 2, Portsmouth-street, and Nos. 51-2 and 54, Lincoln's Inn-fields; her statues stood at the street's two ends. Bagford, who kept a book shop at Turnstile-alley, says the street was designed for a square, and that it was the first uniform street, the houses being stately and magnificent; Walpole says many of the houses were by John Webb, Jones's pupil. About ten or twelve were erected on the south side, *circa* 1624. The house now numbered 55-6 was by Webb. To the category of names rehearsed in the ordinary text-books we may add those of Lewis, the Mercutio of his age; Mrs. Clive, Miss Pope, Sir Joshua Reynolds, as Hudson's pupil, at No. 55-6; the Earl of Chesterfield, in 1657;* Sheridan in 1778; George Coleman the elder; at No. 5, on the north side, Miss Mitford, in 1828; and on the south side Frederick and John Crace.

Across the middle line of the new road stand the premises (rebuilt in 1880), Nos. 72-76, Great Queen-street, of a printing establishment familiar to readers of the *Builder*. Love & Wyman, Limited, as reconstituted in 1897, are the successors of Cox & Begg, who removed thither from the Savoy in 1760. Edward Cox and later partners were printers during a century and longer to the East India Company. Laman Blanchard and Douglas Jerrold had been their "readers." To Charles Wyman, who entered the firm upon John Lewis Cox's retirement, succeeded his two sons, C. W. Henry and E. Franck Wyman. Cox bought the press used by Benjamin Franklin (1723-6) when a journeyman printer at J. Watts', on the south side of Wild-court, where is now the Board School. Franklin lodged in Duke (since Sardinia) street, opposite the chapel. Some forty years later, on coming to England as delegate of the Pennsylvania Assembly, he visited Watts' to see his press, now in America, of which Mr. Charles Wyman presented a replica, perhaps also used by Franklin, to the Patent Office Museum in 1863.

Between Great Queen and Sardinia-streets are Wild-court and Little Wild-street, laid out in 1695 over the garden ground of Wild, or Weld, House, built early in Charles I.'s reign by Sir Edward Stradling, on two acres of Aldewych-close, and bought in 1651 by Humphrey Weld, a wealthy parishioner of St. Giles. The house, having a frontage of 150 ft. to Great Wild-street, and ground 300 ft. deep, contained thirty-three rooms, with garrets and cellars, as advertised "to be lett" in the *London Gazette*, 1694, No. 3010. The family used to rent it to foreign ambassadors and other persons of quality; being Roman Catholics, they often laboured under suspicion of harbouring Papists. On December 11, 1688, the day of James II.'s flight, the mob pillaged Weld House, where the Chapel Royal plate had been deposited, and burned the library and effects of Don Pedro Ronquillo, ambassador from Spain. Of Wild-court there are illustrations in the *Builder*, November 18, 1854.

From an upper window of the Soane Museum one gains a prospect unexcelled by that of any other equal area in the town for the measure and diversity of its architectural and historical interest. To our right hand is the work of Inigo Jones, Winde, and Kent; to the left are Jones's Gothic chapel, with buildings due to Taylor, Hardwick, and Scott; in front rises Barry's College of Surgeons, whilst the story of nearly four hundred years could be filled in the remoter space between Sir Thomas Lovell's gate-house at Lincoln's Inn, and the flêche of Street's great hall of the Courts of Justice.

In the fields below, on May 13, 1692, the Earls of Clare and Thanet fought the duel, which, with their lawsuit, arose after the death of their father-in-law, Henry, Duke of Newcastle, who had left the bulk of his fortune to his daughter, Countess of Clare; and there, as Burnet writes, William Lord Russell triumphed over death. In 1841 Sir Charles Barry prepared plans for new Law Courts to occupy nearly all the 7½ acres of the garden ground.

In September, 1613, the Privy Council, moved thereto by members of the Inn, direct the county justices to restrain certain proposed building, in defiance of the king's proclamation, in the Fields. To the south and north of a pathway from Great Turnstile to Fortifeue-lane (Sardinia-street) then lay respectively, the Cop and Purse Fields—jockeys' training grounds, the resort and haunt of idle and vicious vagrants, footpads, and their associates. Five years elapse, and a special commission is directed to Lords Verulam, Worcester, Arundel, and Pembroke, Inigo Jones, "et aliis pro supervisione camporum vocatorum Lincolnes Inn Fieldes." They are to frame and reduce the Fields both for sweetness, uniformity, and comeliness, into such walks, partitions, or other plots, and in such fashion both for public health and pleasure, as Inigo Jones shall, with the Sovereign's approval, design.* Of Jones's designs, covering 12 acres, only the west side, Arch, or West, row, was carried out. He began with Portsmouth House, at the south-west corner, where, at the end of a passage leading out of Portsmouth-street is No. 2, Lincoln's Inn-fields Chambers, a red-brick house that retains its original elevation with Ionic pilasters bearing on ornamented bands the cognisances carved in stone of the Queen Henrietta Maria. Turning northwards we see that some of Inigo Jones's houses have disappeared, the elevations and fronts of others have been altered and stuccoed; Nos. 54† (the Chapel Presbytery House), 55, 59-60 (Lindsey, or Ancaster House), and 64 have suffered least change. A line of piers with curtain walls and gates screened the forecourts; of the original rusticated stone piers, four, with their ball pinnacles, remain in front of Nos. 51-2, and four in front of Nos. 53-5. Lindsey House retains two of its fine red brick piers—Hatton says there were six—with carved stone finials, and two old lamp holders, but has lost the urns from above the balustrade, and the front is stuccoed. The house, built in 1640 for Robert Bertie, Earl of Lindsey, who fell at Edgehill, was sold by Robert, fourth Earl of Lindsey, advanced Duke of Ancaster and Kesteven in 1715, to Charles sixth Duke of Somerset, the "proud" Duke, who died in 1748 and devised it to his eldest surviving daughter Frances, Marchioness of Granby. It was inhabited by Spencer Perceval, and, after its conversion, in 1894, into chambers, by John Martin, the painter, who died there in 1854. Over the archway beneath Nos. 54-5, on each front is a tablet, "Dvke-street, 1648." In his early days Tennyson occupied chambers on the top floor of No. 55. John Forster lived at No. 58, described as Tulkinghorn's in "Bleak House." At No. 61, on the second floor, Thomas Campbell lived in retirement for nearly two years, 1828-30, after his wife's death. Cunningham says, in his "Life of Inigo Jones," there is an oil-colour view at Wilton showing Arch-row. In Mr. C. W. Heckethorn's book upon Lincoln's Inn-fields and around, reviewed in our columns May 16, 1896, is reproduced a print, *penes* Mr. Fancourt, of Highbury, who ascribes it to Hollar, which may represent the houses as Jones intended them to be. In our article of October 22 last upon the church of SS. Anselm and Cecilia (the Sardinian Chapel) we gave a reproduction of the silver medal by George Bower, *ob.* 1690, of which the reverse bears a beautifully wrought relief showing Arch-row, with its old elevations, the forecourt walls, the square railings, and the chapel in ruins. On August 2, 1885, we recorded the sale at auction for 13,000*l.* of No. 63, since rebuilt, extending to Queen's Head-yard in the rear, and covering 11,350 ft. superficial, which Mr. Norton, afterwards Speaker, and first Baron Grantley, bought in 1758 for 1,721*l.* In May, 1892, the freehold of No. 45, area 6,100 ft., realised 15,760*l.* In Portsmouth-street is the *soi-disant* "Old Curiosity Shop," a supposed relic of the Duchess of Portsmouth's dairy-house.

---

* For the last two named, as well as for the Metropolitan Electric Supply Company's premises, Sardinia-street, new sites will be provided.

* See the advertisement in the *Mercurius Politicus*, November 19-26, 1657, of the robbery of his "pictures" in gold and jewelled cases.

* Of the present and original railings which in 1735 replaced the posts around the square, two stone obelisks are in the Soane Museum. The garden, acquired by the L.C.C. for 13,000*l.* from the trustees appointed in 1657, was opened to the public on February 22, 1895.

† Nos. 5ca, 50, 56, 62-3, and 65—rebuilt; 51-2-3, 61, and 64—elevations changed; 51-2, 54-5, and 64—Ionic pilasters retained; 51-2, and 54—roses and fleurs-de-lis on pilasters; 57-8, one house, of stone, apparently later—six Ionic pilasters, and semi-circular portico on four fluted Doric columns; 66-7, Newcastle House, by Captain Winde, for William, Lord Powis, *circa* 1686. Compare with the elevation of Thanet House, Aldersgate-street, built by Jones in 1650, pulled down in 1882.

A history of London markets should give foremost place to the "New Market" founded in St. Clement's-fields *circa* 1654 by John, second Earl of Clare, whose successful contest in respect thereof with the City of London facilitated the establishment of similar markets west and north-west of Temple Bar. The original booths and sheds, "The Colonnade," stood where are now Newspaper-buildings and the St. Clement Danes and Clare Market parish-house (W. H. Smith Memorial), 1897-8, Messrs. H. & P. Currey, honorary architects. To account for the surrounding street names we should recall that Denzell Holles, grandson of Sir William Holleis, elected Lord Mayor in 1539, married Anne, sister of John Sheffield, Lord Sheffield. Their son John Holles, of Houghton, co. Nottingham, was created Baron Houghton in 1616, and advanced Earl of Clare in 1624—honours for which he is said to have paid the Duke of Buckingham 15,000*l.* He married Anne, daughter of Sir Thomas Stanhope, and, dying in 1637, left two sons, John and Denzell. Denzell was elevated Baron Holles of Ifield; John, second Earl, married Elizabeth, daughter and co-heir of General Sir Horatio Vere, Lord Vere of Tilbury, and died in 1665. His son Gilbert, third Earl, was father of John, fourth Earl, advanced Marquis of Clare and Duke of Newcastle, married Margaret, daughter and co-heir of Henry Cavendish, second Duke of Newcastle, and succeeded to the fortune of his kinsman, Denzell, Lord Holles of Ifield. He died in 1711. His only daughter, Henrietta, brought her property in marriage (1713) to Edward, Lord Harley, son and heir of Robert Earl of Oxford. In 1640 Charles I. licensed one Thomas York to build over St. Clement's-Inn-Fields, the inheritance of the Earl of Clare, the houses to be erected on each side of the causeway leading from Gibbon's Bowling-alley, or tennis-court, at the coming out of Lincoln's-Inn-Fields to the Reindeer-yard, leading into Drury-lane, not to exceed on either side the number of 120 ft. in length, or front, and 60 ft. in breadth, and to be of stone or brick. Three years afterwards the King licensed Colonel Gervase Holles to erect a specified number of houses and streets north-west of the later market square.* The Act of 1657 for restraint of new buildings in and about London reserved to the Earl of Clare, who lived in great state where is now Clare House-court, the privilege of erecting more houses upon the Holles estate. In course of time the market changed its character, giving place to slaughter-houses with their concomitant nuisances which renit an opprobrium and reproach. The last of the slaughter-houses was pulled down in 1889 for the Strand Union receiving workhouse and casual wards, in Bear-yard. A fire in Bear-yard, December 17, 1809, revealed the walls of the theatre opened on November 8, 1660, by Killigrew and the King's company, in Charles Gibbon's tennis-court. On the front of the house (recently demolished) at the corner of Gilbert-passage and Gilbert (re-named Twining) street was a fine stone carving, with date 1659, of the arms of Lord Clare; on the splayed angle of the baker's shop, No. 13, Clare-street, is a carving of two negro's heads with date and letters "1715, S. W. M."; at the south-west corner of Denzell-street, on the side wall of the "Royal Yacht" tavern, is the inscribed tablet erected in 1682 by Gilbert, third Earl of Clare, to the memory of his uncle Denzell, Lord Holles, whom Charles II. sent as ambassador to France. Vere-street Board School occupies the site of the "Bull's Head," the resort of the Artists' Club, to which Hogarth belonged, and of Dr. Radcliffe, who was there informed of his loss of 5,000*l.* in the South Sea venture, and made his memorable reply. In Stanhope-street was born, on December 12, 1779, Grimaldi, the clown; W. West kept his toy-theatre shop in Wych-street, and there sold the "1d. plain, 2d. coloured" prints so popular some fifty or sixty years ago. The "George the Fourth" has just been rebuilt, its neighbour, the "Black Jack" (or the "Jump")—the favoured haunt of Dick Turpin and Joe Miller—was demolished in August, 1896.

In Craven-buildings, opposite the site of the old "Cock and Magpie" and Drury-court, an early home of Nell Gwynn, lived Mrs. Bracegirdle, and after her, in the same house, Mrs. Pritchard, Mme. Vestris, and Thomas A. Arne, who, at No. 17, composed the music for "Comus," revived at Drury Lane in 1738. Craven-buildings and the Olympic Theatre were erected on the ground of Drewry House, the residence of William, first Earl of Craven, who is supposed to have privately married James I.'s daughter, Elizabeth, after whom it was named, as a public house, the "Queen of Bohemia"; the theatre, first built by Astley, was rebuilt in 1890 from Messrs. Crewe & Sprague's designs. Maypole-alley commemorates the maypole in the Strand, opposite Drury-court. The pole set up by John Clarges, the farrier of Drury-court, in honour of his daughter's good fortunes, was given by Sir Isaac Newton in 1717 to the Rev. James Pound, Rector of Wanstead, for raising the big telescope which Hugon presented to the Royal Society. The Opera Comique and Globe Theatres cover the site of Lyon's Inn, an old hostelry, converted into an Inn of Chancery, *temp.* Henry VIII. The Architectural Association was founded there in 1842, and used to meet in the hall (1700) until, we believe, 1859. The carving of a lion on the corbel of a corner-post at the end of the narrow passage from the Strand to No. 36, Holywell-street (where is still the sign of the "Half Moon"), was secured about twelve years ago for the Guildhall Museum. In "Things I Have Seen, and People I Have Met," the late G. A. Sala describes the clearing of the well behind the "Old Dog," in Holywell-street (more probably the "Spotted Dog," Strand), in which was found, with a vast variety of things, a punch-bowl having a William and Mary guinea encrusted in the base, and a memorandum scrap of paper inscribed, "Dr. Goldsmith, 13sh. 10d." New Inn, whence Sir Thomas More migrated to Lincoln's Inn, has its origin in another hostelry, by sign of "Our Lady," acquired *temp.* Edward IV. by Chief Justice Sir John Fineux for the students of St. George's Inn, near the Old Bailey. Danes Inn forms a set of offices built on the site of the "Angel" inn (pulled down *circa* 1855) whence Bishop Hooper was taken to be burned at Gloucester in February, 1555. The Gaiety Theatre, opened on December 21, 1868, had been converted by the late C. J. Phipps from the Strand Music Hall, erected (on the site of the arcade named after the earlier Exeter Change) after the late E. Bassett Keeling's designs. The *Morning Post* offices were considerably enlarged four years ago from the plans and designs of Mr. H. O. Cresswell. The Globe Theatre (S. Simpson, architect) was opened on November 28, 1868.

## THE ENGINEERING CONFERENCE.

THE second Engineering Conference held in London under the auspices of the Institution of Civil Engineers has been in session this week, on the 7th, 8th, and 9th. The meetings have been held partly in the Institution building in Great George-street, and partly in the buildings of the Mechanical Engineers and the Surveyors' Institution; the sections dealing with Machinery and Electricity having met in the Mechanical Engineers' building, and those dealing with Railways, Harbours, Mines, and Metallurgy in the Surveyors' Institution building. The Middlesex County Council also allotted to the use of the Conference their Council Chamber and Committee Room, where the subjects of Docks, Canals, Waterworks, Sewerage, Gasworks, and Shipbuilding were discussed.

The papers read are all short and eminently practical, the subjects being classified as follows:—

### *Section I.—Railways.*

June 7.—"The Advantages, or Disadvantages, of Uniting the Lock and Block Signalling Appliances of Railways." By Alexander Ross, M.Inst.C.E.

June 7.—"Mountain Railways." By C. A. W. Pownall, M.Inst.C.E.

June 7.—"What is a Light Railway, and what Circumstances should Govern the Gauge?" By A. C. Pain, M.Inst.C.E.

June 7.—"The Various Systems of Railway Fog Signalling." By W. S. Boult, A.M.Inst.C.E.

June 9.—"Causes of Earth Slips in the Slopes of Cuttings and Embankments of Railways, and How to Prevent or Remedy them." By R. Elliott Cooper, M.Inst.C.E.

June 9.—"The Most Expeditious Method of Relaying the Railways of this Country, Involving the Least Interruption of Traffic, Having Regard to Safety and Economy." By Harry Footner, M.Inst.C.E.

June 9.—"Economy in Handling and Transport of Minerals." By R. C. H. Davison, M.Inst.C.E.

### *Section II.—Harbours, Docks, and Canals.*

June 7.—"The Discharging and Reloading of Large Steamers." By W. H. Hunter, M.Inst.C.E.

June 7.—"The Length, Width and Depth, and Shape and Mode of Construction of Locks and Entrances and Graving Docks, Having Regard to the Increasing Sizes and Shapes of Vessels." By R. C. H. Davison, M.Inst.C.E.

June 8.—"Sandpump Dredgers." By A. G. Lyster, M.Inst.C.E.

June 8.—"Notes on the Effects of Waves on Breakwaters in Different Depths of Water." By W. Shield, M.Inst.C.E.

June 8.—"The Design of Breakwaters." By T. W. Sandeman, M.Inst.C.E.

### *Section III.—Machinery.*

June 7.—"Forgings, and the Machines Used in Producing them." By E. S. Brett.

June 7.—"Compound Locomotives." By F. W. Webb, M.Inst.C.E.

June 7.—"The Relative Advantages of Different Kinds of Power for Tramways, Light Railways, and Motor-Car Traffic, both Heavy and Light." By Thos. Parker, M.Inst.C.E.

June 9.—"Cranes, and the Power to be Used with Them." By W. Pitt, M.Inst.C.E.

June 9.—"Machine Tools, with Special Reference to American and German Practice as Compared with English." By A. Greenwood, M.Inst.C.E.

June 9.—"Separate Condensing Plants for Factory Purposes." By Sir A. Seale Haslam.

### *Section IV.—Mining and Metallurgy.*

June 8.—"Modern Improvements in Coal Mining: Winding from Deep Coal Mines." By H. W. Martin, M.Inst.C.E.

June 8.—"Modern Practice in Gold Mining." By T. H. Hammond.

June 9.—"The Influence of Casting-temperature on Steel." By R. A. Hadfield, M.Inst.C E.

### *Section V.—Shipbuilding.*

June 7.—"On the Practicability of so Constructing Merchant Steamers as to Render them Readily Available for War Purposes." By T. Harvard Biles, M.Inst.C.E.

June 7.—"Recent Developments in Cargo Steamers." By E. W. de Rusett, M.Inst.C.E.

June 7.—"Swift Passenger Steamers of Moderate Size." By E. L. Martin, M.Inst.C.E.

June 9.—"The Application of Mechanical Devices to the Riveting and Caulking of Ships; also the Material of Ship Rivets." By R. T. Napier, M.Inst.C.E.

June 9.—Graving-blocks and Appliances. By A. J. Maginnis, M.I.N.A.

### *Section VI.—Waterworks, Sewerage, and Gasworks.*

June 8.—"The Use of Filtered Flood Water." By M. W. Hervey, M.Inst.C.E.

June 8.—"Sewage-sludge Disposal by Natural Agencies." By G. S. Woodhead, M.D.

June 8.—"A Consideration of the Rate per Head per Day of Supply in Different Towns, and of the Causes which Increase or Diminish it in Particular Instances." By J. Watson, M.Inst.C.E.

June 9.—"Labour Saving Appliances in Gasworks." By C. C. Carpenter, M.Inst.C.E.

June 9.—"Notes on the Recovery of Residual Products from Coal-Gas During the Period of Purification." By W. Foulis, M.Inst.C.E.

### *Section VII.—Applications of Electricity.*

June 7.—"Methods of Electrical Transformation." By T. Swinburne.

June 7.—"Some Non-integrating Electric Meters." By Professor Ayrton, F.R.S.

June 8.—"Economical Transmission and Distribution of Electricity from a Distance." By H. F. Marshall, M.Inst.C.E.

June 8.—"Mechanical Traction by Electricity." By G. C. Cuningham, M.Inst.C.E.

The President, Sir W. H. Preece, in the course of a short opening address, referred to one or two questions of general interest to members of the engineering profession. The following is the concluding portion of his address:—

"The Lord Chief Justice's Bill for the suppression of illicit commissions is one welcomed by every member of this Institution, and it is most gratifying to find that no suspicion of improper practice has been adduced against our profession. We do, however, hear at times of a dangerous border-ground between consultation work and contracting, which is a pitfall to be avoided, and to be surrounded by danger-signals. Again, occasionally, and fortunately rarely, we find the diploma of the Institution converted into an advertisement; this the Council strenuously protests against in the best interests of the entire body.

The examination system, introduced just at the epoch of our first conference, has proved a most unqualified success, and it has been welcomed by none more than by those who are subjected to its troubles. During the last session, 107 candidates passed the Associate membership examination, in addition to thirty-one who qualified by passing exempting examinations elsewhere, and sixty-five who satisfied the conditions of election by theses. Further, fifty-three passed the Institution examination for studentship, whilst 167 qualified in that respect by passing various recognised examinations. Thus we added 423 new names to our roll—all of whom satisfied the examination standards. The Council feel that the system of examination has enhanced the intrinsic value of the diploma of the Institution, and that it has added materially to the dignity and responsibility of the profession. This diploma has become so valuable and so necessary to the practising engineer, that occasionally would-be practitioners improperly assume the title of member or associate. Fortunately criticism is too wide-awake, and the public interest too well served by all who are jealous for the prestige of their profession, to permit deceptions of this kind to escape speedy detection.

---

* Confer the Reports, just issued by the Historical MSS. Commissioners, upon the Buccleuch and Hatfield MSS., as to the building grants.

The position of engineering has rendered it necessary for all new Universities—and especially for the Imperial University of London—to form a faculty of engineering, but the Council of this Institution has deprecated the idea of conferring degrees in engineering. Every engineer must acquire a knowledge of the scientific principles and the mental tools that form the bases and aid the operations of his profession, but he can be an engineer only by becoming an expert in its practice. Examination can test the former qualification alone, and this is what we have introduced. Practical training is not a matter amenable to examination. Hence we consider that degrees in science are quite sufficient to signify the successful completion of a University career, which should be strictly scientific; and that the diploma of the Institution should be the criterion of that professional qualification which is the result of practice alone. And here may I mention that there is a tendency observable to avoid the condition that those admitted into our junior ranks shall be persons who are or have been bonâ-fide pupils of corporate members of the Institution. Further, no one can be said to be regularly educated as a civil engineer unless he has passed through the ordeal of the training to be acquired in the workshop and the drawing office. It would be well, for the comfort of the Council, if those who rather lightly, and sometimes thoughtlessly, sign forms for election, would first inquire if the conditions printed on the back of every form were properly complied with."

Among the sectional papers read on the first day those in Section I. included two subjects which are of practical interest to all travellers, of whatever profession. Mr. Bailly, in his paper on "Railway Fog-Signalling," after mentioning and classifying the various systems of fog-signalling now in use, among which however, "the man with the detonating signals" is still by far the most prevalent factor, recommended for consideration his system of magnetic signalling without contact, which operated a miniature semaphore on the engine, and was thus independent of manual agency, and fulfilled most directly the real object of such signalling viz.: to warn the driver of the train. A cognate subject was treated by Mr. A. Ross in his paper on "The Advantages, or Disadvantages, of Uniting the Lock and Block Signalling Apparatus on Railways." The object again was to suggest a means of doing away with the element of human fallibility in block signalling. The following extract explains the main point of the paper. After giving a description (hardly necessary, we should have thought, for his audience) of the working of the block system on a railway, Mr. Ross continued :—

> "It may now be observed that the locking apparatus, with the levers working the points and outdoor signals, in themselves as perfect as human ingenuity and good workmanship can make them, are worked independently of the inside block telegraph signals, the only connecting link between the two being the signalman who works both; and there is no physical obstacle to prevent him, in a moment of forgetfulness, giving outdoor signals in conflict with his indoor block instrument; and the question raised for discussion is, whether it is desirable or not, to unite and combine the two systems, either mechanically or electrically, into one complete system in such a way as to ensure, not only unity of action at one signal-box, but also with the next box in the rear and in advance.
>
> The conditions which should be fulfilled by an efficient 'lock' and 'block' arrangement may be stated as follows, viz. :—The rear signalman should not be able to lower his outdoor signals, or allow a train to proceed into the section in advance of him, until the signalman in advance has given him the necessary permission by unlocking the starting signal. The rear signalman, having received permission from the advance signalman to allow a train to proceed into the section, and having lowered his signals, and the train having moved forward on its journey, should be compelled to put his starting signal to danger; and the lever working the same, on being put back to the normal position, should become locked in such a way that it cannot be used again without the permission of the signalman in advance. This operation should free the home signal of the rear section, so that a second train may be brought forward to his starting signal; and, for the protection of this train, the home signal should be placed to danger, and, in the back stroke, become locked before a second train can be offered to the rear signalman.
>
> When the first train has arrived at the signal-box in advance, and has passed his home signal, and the signal 'train entered section' has been received from the signal-box still further in advance, the signalman must put his own signal to danger before he can give 'line clear' to the signal-box in the rear for a second train. This applies when the section is from starting signal to home signal, but if the section is from starting signal to starting signal, the condition will apply to the latter . . . .
>
> If the conditions enumerated above are secured, the advantages appear obvious, some of which may be stated to be as follows, namely :—
>
> 1. The impossibility of the outdoor signals being at variance with the indoor block instruments.
> 2. The rear signalman being compelled to forward a train to the man in advance.
> 3. The advance signalman being unable to accept a second train before his first has cleared out of the section.
> 4. Absolute protection for a train while in section.
> 5. Impossibility of the signalman in the rear forwarding any train in error.
> 6. The co-operation of three men in signalling a train."

Considering that some of the worst railway accidents have happened through the momentary failure of the human element in the machinery, even without anything that can be called carelessness, but from a mere trick of the brain, Mr. Ross's proposal is surely worth serious consideration. Mr. Pain's paper on light railways urged the standardising of one or at most two light railway gauges, so as to simplify and accelerate the supply of plant and rolling-stock for such railways.

In the machinery section Mr. Webb's short summary of the history and stages of development of his compound locomotive is interesting, but the most important sentence is the closing one, that the saving in fuel in these compound engines, where the waste steam from two high-pressure cylinders is utilised in a third low-pressure cylinder, is from 19 to 20 per cent., and that "this is confirmed by observations made in the United States." It has, we know, been vigorously denied that there is any material economy of fuel secured by the compound system; but we can hardly fancy Mr. Webb and his very prudent and financially careful railway company going on building these engines, at an extra cost in construction, if the economy were not genuine and demonstrable.

Mr. Brett's paper on the making of large forgings by dies, which he regards as still in its early stages, and capable of much greater development, is of considerable interest.

The note contributed by Mr. James Swinburne on "Methods of Electrical Transformation" is a valuable one. The title, however, is rather a misnomer, for, practically, the only problem considered is the relative costs of the mains in different systems of distribution. The modern method of using rotary converters to transform alternating into direct current brings into prominence the question of whether it would not be more economical to use high-pressure direct currents and a dynamotor. Mr. Swinburne thinks that this question deserves serious consideration. A table is given comparing the costs of the copper mains for long-distance transmission for direct monophase, diphase, and triphase currents. In the unrevised proof of his paper the numbers for triphase currents are wrongly calculated, and this rather vitiates the argument. The assumption of sine waves is also made, an assumption which has been severely criticised by Mr. Swinburne himself on other occasions. His treatment of the cost of insulating the cables is excellent. He calls attention to the incipient discharges into the air that take place at the surface of small bare copper conductors at high pressure, and the consequent waste of power that is taking place.

Professor Ayrton's paper on "Some Non-Integrating Electric Meters" is a valuable and useful compilation of facts. Electric meters as used in electric lighting are not touched on, but he considers ammeters, voltmeters, and ohmmeters. He points out how soft iron instruments are affected by the shape of the wave of the applied electro-motive force, and how this can be compensated for to a certain extent by putting an inductive coil in parallel with them. He mentions the great improvement in the magnetic qualities of iron that has taken place in recent years, and anticipates still greater improvements in the future. Galvanometers of the moving coil type (d'Arsonval) are now replacing those with a moving needle. Professor Ayrton recommends the use of a transformer for measuring large alternating currents, but does not mention what formula is to be used. We suppose he goes on the assumption that the difference between the magnetising turns on the primary and secondary coils is constant at all loads. This assumption is only permissible at heavy loads on the transformer, and when its iron core is of the closed circuit type.

◆

## MAGAZINES AND REVIEWS.

THE *Art Journal* is chiefly occupied by Mr. A. C. R. Carter's article on the Royal Academy exhibition, somewhat too enthusiastic for our convictions. The frontispiece is Mr. Peacock's clever picture of a lady dancing, which we like better in the engraving than in the original. In the June issue of old articles and illustrations under the title "Fifty Years of Art" there is included an admirable paper by Hamerton on "Lake Surfaces," which few men had better opportunities of studying.

The *Studio* (May 15) includes an article on "A Scheme of Decoration for a Bachelor's Room," with illustrations by Mr. G. M. Ellwood, which show rather too much straining after clever tricks of line and effect. "Jewellery and other Enamel Work by George Frampton, A.R.A." shows some illustrations of excellent and interesting work, and Mr. F. Brangwyn's designs for stained glass are also of interest; one or two of these are to be seen in execution at the Grafton Gallery; the defect that strikes us in them is a want of decorative quality of line in the details.

The *Architectural Review* (Boston) vol. vi. No. 5, contains an interesting article by Mr. Russell Sturgis, under the title, "How to Treat the Classical Orders." Mr. Sturgis seems to consider that, so far from the Classic Order having run its course, there is a new field open for it in connexion with iron trabeated construction. In the course of the article Mr. Sturgis remarks :—"Forty years of noting the opinions of the reading class of our public have convinced the writer of this, that the building most likely to be popular is a grave and simple one, as large as possible in its parts, relatively speaking, and with as much sober monotony of design as may be. To persons of such preferences as these, the charm of the classical orders is unquestioned; they are the only means of giving to these buildings a variety and play of light and shade which their surface conception demands." Not quite the *only* means, we think. What about the Riccardi Palace, for instance? The number contains an illustrated article on "Port Sunlight" and its buildings. The principal illustrations are details of the interior finish of a house by Messrs. Stone, Carpenter, & Willson, which are very refined, but are simply the Adam style transplanted to America.

The *Berliner Architekturwelt* includes illustrations of architecture, furniture, textiles, pictures, and sculpture, recognising the connexion of every branch of art with architecture; but the result is certainly not happy, especially as far as the architecture is concerned. The architectural designs are full of pretentious tricks of effect, compared with which the vagaries of the new school in England are tame and respectable.

The *Deutsche Kunst und Dekoration*, a new publication, contains a great many illustrations of decorative work of various kinds, often forcible and original, but unfortunately for the most part coarse and sensational in character.

The *Engineering Magazine* includes an article on the important subject of the "Hydraulic Transmission of Power," a means of applying power for public use which we believe is still in its early stages, in comparison with probable future developments. The writer, Mr. Ellington, considers in this issue the question of what can be done with the hydraulic power when obtained. A good many illustrations of hydraulic machines accompany the article; but they would be of more practical value if they were in the form of technical sectional drawings, instead of mere photographs of the external appearance of the implements.

The *Antiquary* contains an article on the Royal Academy, "The Antiquary Among the Pictures," a study which might be very well undertaken from the archæological side, but we do not see that much light is thrown on the archæological accuracies and inaccuracies of painters, and when the writer tells us that Mr. Abbey's "O Mistress Mine" merely suggests lay figures and cleverness of draping he is displaying his own shortcomings of perception. In the same number Mr. H. P. Feasey commences a series of articles on "Curiosities in and around our Ancient Churches."

*Scribner* has an article by Miss Cecilia Waeler on "The Modern Group of Scandinavian Painters," and under the heading of "The Field of Art" some considerations as to the education of the artist in the United States. We observe that the writer, Mr. W. H. Low, condemns the prevalence of mere fagging over model-drawing, so many hours a day, and wishes to see less "grind" and more thought. We may quote the following comment in regard to this:—

> "A vivid memory arises of the arrival in the studio where I was studying in Paris, of the youth who afterwards became its most distinguished pupil, and than whom to-day no one is more illustrious in modern art. He was barely seventeen, and he brought, to submit to our master as a means of admission to the ranks of his pupils, a great roll of drawings and sketches in colour. They were not conventional drawings from the cast or model, though doubtless he had made numbers of these, as we all must do sooner or later, but they were works which showed that the youth had the temperament of an artist and was worthy of the painstaking assistance in the development of his gift which he sought at the hands of the master. And, as I look back on the Paris of twenty years ago, I see clearly that, of the numbers of art students assembled there, every one who is known to-day, who has done anything to be known by, could have been admitted to study, if such had been the rule, by the submission of spontaneous original work."

The *Century* has little of artistic interest this month; it contains, however, an article on the always fascinating subject of "Niagara," by Mrs. Van Rensselaer, with illustrations by Mr. Castaigne.

*Macmillan* has a good article on the Rembrandt etchings at the British Museum, by Mr. C. Parkinson.

In the *Forum* is an article styled "American Art Coming into its Own," which strikes one as "a little too previous." The writer says that great attention was directed to the actual achievements of American art owing to the sale of Mr. Clarke's pictures last year, and that the public "recognises the value of the native note in native art." We should recognise it too, but where is it? Hitherto we seem only to have seen the French note in American art.

In the *Fortnightly* Mr. Archibald Little draws a parallel between "Two Cities: London and Pekin," chiefly interesting for its description of the Chinese city. He indulges in exaggerated pessimism about London, making it out as bad as possible, a kind of writing which is a cheap bid for the verdict of the class of readers who enjoy running down everything in their own country.

The *Contemporary Review* contains an admirable article by Mr. Brett on "Realism in Art," one of the best-reasoned papers on this side of the question that we have read. His position is that the sentiment which we look for in art depends on perfect execution, and is not any quality existing by itself apart from execution. We do not agree with it all, but as against the fallacy of "impressionism" it is a very powerful indictment, and an article which should be read by all who are seriously interested in painting.

To the *Revue Générale* M. Arnold Goffin contributes an eloquent and enthusiastic article on some of the early Florentine painters, more especially dealing with Fra Angelico.

The *Gentleman's Magazine* includes one of those useful popular summaries of points in astronomical knowledge which Mr. J. Ellard Gore contributes to this magazine from time to time. The present one is on "The Sun's Journey through Space," and embodies the results of modern observation (familiar to those who pay any attention to current astronomical science) as to the movement of the sun, the point in the stellar system towards which it is apparently moving, and the observed movements in some of the other "fixed" stars. There is one point in regard to this question on which we may venture a suggestion. There seems to be an inclination on the part of the astronomical world to assume that, as the planets move round the sun in orbits whose elements are strictly defined, so the sun and the other stars are revolving in defined orbits round a centre not yet defined or recognised. We would put the question: Is there really an analogy, in a mechanical sense, between the two cases? In the case of the solar system it is easy to see why a series of satellites of the sun, detached at successive periods from a central mass which still remains far greater than all their combined mass, should be strictly controlled in their orbit and rate of revolution (with the exception of some irregularities due to mutual perturbation) by this great central weight. But is there anything analogous in the system of the fixed stars? We at all events know of no central body of preponderating mass, which could control the stars as the sun controls the planets; if there were a luminous body of such comparative mass, surely even the immense distances of stellar space could not prevent its being recognisable to our vision as something far more prominent than any "first magnitude" star. No such body being apparent, may not the movement of the fixed stars be rather in the nature of a "drift," not subject to any such rigid and calculable law as that which governs the revolution of the planets round the sun? We do not profess, of course, in these pages to deal scientifically with astronomical questions; but the mechanism of the heavens is, or should be, of interest to every architect; and if our query should come under the notice of any scientific astronomer, we should be interested to know his views on this point.

The *Quarry* commences an essay on "The Mineral Industry of the United Kingdom," illustrated by a geological map of England and sections of strata.

*Knowledge* includes an article on "The Hereford Earthquake of 1896," by Mr. Charles Davison, who has long made it a special business to collect and compare data as to earthquakes and their phenomena and effects.

## THE ARCHITECTURAL ASSOCIATION SUMMER VISITS:

### COBHAM HALL AND CHURCH.

ON the 3rd inst. a party of about thirty members of the Architectural Association, under the guidance of Messrs. G. A. Lansdown and F. W. Aldwinckle, junior, travelled down to Sole-street Station to visit Cobham Church and College, and Cobham Hall.

Arriving at Cobham village at about 1 p.m. the party first proceeded to the "Leather Bottle" inn, with its Pickwick parlour, made famous by Charles Dickens. After inspecting the parlour, which is profusely decorated with prints of all kinds, representing the characters of Dickens' novels, and with numerous portraits of the celebrated author, luncheon was served. The church was afterwards visited. It is a structure remarkable for its fine and spacious Early English chancel, which contains a superb altar-tomb, placed centrally before the communion-table. The tomb is an exceptionally rich example of early Renaissance work. It is to the memory of the Lord Cobham who founded the college close at hand, and bears upon its top effigies of Broke, Lord Cobham, and his wife. On each side are five niches, each with a kneeling figure of a knight. These figures represent members of the family of Broke, or Brooke, and they are all dressed in coats fully blazoned with their arms. Each figure kneels upon a cushion facing eastward. The cushions are beautifully decorated with arabesque work formed by a black inlaid cement. The Ionic columns at the corners of the tomb are quasi-fluted with the same material. At the ends are more figures and shields of arms. All the armorial bearings both on the coats and shields are blazoned in inlaid colour, and to any one versed in heraldry must form an extremely interesting study. On the floor of the chancel west of this tomb are a series of fine brasses, including that of Sir Nicholas de Hauberk, a reproduction of which was, not many years ago, given in *The Builder*. The architectural features of the chancel are of great interest, including, as they do, the beautiful lancet windows at the sides and in the east end, a beautiful double piscina enriched with the dog-tooth ornament, as well as a triple sedile and another piscina, both of Perpendicular work. There are the remains, near the east end of the south wall, of a stair, which is said to have led up to a rood loft, but what its real purpose was is not easy to say. In the vestry are some remains of well carved figures, which are said to have formed part of the decoration in connexion with this stair. Cobham College, formerly an ecclesiastical building, is now used as an almshouse. It consists of a building enclosing a quadrangle, the dimensions of which are about 55 ft. by 65 ft., the height of the walls to the eaves being about 17 ft. Beyond this building are the remains of another building, where are to be seen a very large arched lintel of a kitchen fireplace and a doorway having above it a very good coat of arms of the Brooke family, carved in stone, and surrounded by the Garter with its legend. This is protected from the weather by a canopy of Jacobean design, supported on consoles. It dates from the last years of the sixteenth century.

After inspecting these interesting buildings the party proceeded across Lord Darnley's park to Cobham Hall, permission to view which had been kindly granted by his lordship. The hall, which has been illustrated in Messrs. Belcher & Macartney's book on the later Renaissance architecture of England, is well known from that and other representations. The older part of the house consists of buildings forming three sides of a square. The two wings are older than the central portion, and were built by the Cobham family; they are of red brick with stone mullioned windows and dressings, and have interesting central features in the centre of each facing the enclosed garden. The central portion of the house was built by or for the Darnley family, to whom the place was granted after the attainder of Lord Cobham in the reign of James I. Later additions by Wyatt form the present entrance corridor and the stables in the rear. The interior of the house contains some very fine marble mantelpieces and a quantity of pictures, many of interesting persons and not a few of great beauty and value, Rubens and Vandyke being the authors of several.

The most interesting feature of the interior is the gilded hall, a very fine cubical room decorated in marble and gilded plaster. This is known as the music room, and it contains a painting by Vandyke of two Dukes of Lennox, which is placed over the fire mantel, and is perhaps the finest picture in the house. The interior of the house generally, as far as the visitors were permitted to see it, does not contain panelling or other architectural decoration of such interest as might be expected from the external appearance; the internal finishing being, with the exception of the mantelpieces, coeval with Wyatt's work. The visit was pronounced by those who took part in it to have been of very great interest, and the thanks of the party are heartily due to those gentlemen who organised and brought it to so successful a conclusion, also to the Vicar of Cobham, who kindly had the brasses in the church uncovered for inspection, and to Lord Darnley for his permission to view the hall.

◆

## ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

THE members of the Association of Municipal and County Engineers held a Yorkshire district meeting at Sheffield on Saturday, June 3. This was the first occasion on which Sheffield had been visited by the Association, and consequently a good deal of interest centred in the meeting, which was very largely attended by members from various parts of the country. Mr. O. Claude Robson, of Willesden, President, occupied the chair, and amongst those present were Messrs. C. F. Wike, Sheffield; J. P. Barber, Islington; E. G. Mawbey, Leicester; E. Pritchard, Birmingham; J. Price, Birmingham; J. Cartwright, Bury; F. Baker, Middlesbrough; T. W. Stainthorpe, Totnes, Devon; A. D. Greatorex, West Bromwich; C. H. Cooper, Wimbledon; J. Cook, Lancaster; B. Godfrey, Rotherham; G. T. Lynam, Burton-on-Trent; T. H. Yabbicom, Bristol; and many others.

The Lord Mayor of Sheffield (Councillor

Clegg), in welcoming the members, said he was exceedingly glad to have an opportunity of welcoming such an important body as that represented. In consequence of the very great powers which were in the hands of Corporations, the positions of surveyors were becoming increasingly responsible, and it was exceedingly necessary that whenever information could be obtained which would add to the knowledge of members of their profession, it was desirable it should be obtained. Less than twenty-five years ago Sheffield had not realised the responsibilities due to the fact that it was the sixth largest town in the kingdom, but within recent years they had realised those responsibilities and taken steps to improve the town in a way highly creditable to them as a Corporation. When he informed them that since 1875 they had spent upon public improvements and works no less a sum than four and a half millions of money, only half of which was expended on works of a profitable nature, he thought they would agree with him that Sheffield, at any rate within that time, had done a very great deal for the interests of its citizens.

The President (Mr. Robson), in acknowledging the civic welcome, tendered the Lord Mayor very hearty thanks for the reception which he had accorded to the Association. During the twenty-seven years of their existence they had visited most of the principal towns throughout the country, and it was no secret that for some years past there had been a strong desire on their part to visit Sheffield—a city essentially of interest to all engineers by reason of its large industrial works, but of especial interest to them on that occasion by reason of the very large municipal works which were being carried out under the supervision and control of their very distinguished Engineer, Mr. Wike.

The President then announced with regret the retirement of Mr. T. W. Stainthorpe from the position of hon. secretary for the Yorkshire district, as he had taken an appointment in Devonshire. He moved a vote of thanks to Mr. Stainthorpe for the able and energetic way in which he had acted as secretary for the past seven years.

Mr. F. Baker, Middlesbrough, seconded the vote of thanks, which was accorded with acclamation.

Mr. Stainthorpe, in acknowledgment, said his work for the Association had been a labour of love, and he hoped his successor would have an equally pleasant experience of the office.

On the proposition of Mr. Cox, of Bradford, Mr. S. Stead, Borough Engineer of Harrogate, was unanimously elected secretary for the district.

### *Municipal Work in Sheffield.*

Mr. C. F. Wike, C.E., City Surveyor of Sheffield, then presented a paper on ten years of municipal work in Sheffield. After giving some general statistics with respect to the city, Mr. Wike stated that the whole of the highway and road work was done by the Corporation workmen, about 1,900 of whom were employed under his department. With certain exceptions, the main streets were, twenty years ago, narrow and tortuous; this description still applied to some of them, but great improvements had recently been made both in width and line, and these were still going on on an extensive scale. The gradients, while favourable for purposes of drainage, made the question of a suitable form of paving a most difficult one; and there was a great variety of pavement in Sheffield. From inquiries made some time ago, it appeared there were only one or two provincial towns with a larger area of wood paving than Sheffield. The proportion of macadam, unfortunately for the district rate, also ranked high. Many streets had gradients of 1 in 10, 1 in 8, and even 1 in 5, and when there was a heavy rainfall the macadam could not remain upon the surface of such streets, but was washed either upon the low-lying roads or into the sewers, from which eventually it had to be removed at great cost. About 300,000 tons of macadam had been used during the last ten years, a large proportion of which had disappeared in the shape of dust, or had been carted away as mud, or deposited in the sewers. During the last five years the question of the best kind of pavement to be used led to many discussions both in the Council and out, and, though no general principle had been settled, the rule broadly was to lay granite where the traffic was heavy and the gradients would permit (1 in 30 being the limit, except in special cases), to lay wood on some of the more important business streets, and in others gritstone paving or macadam. The comparative life of the different kinds of pavement in streets of heavy traffic had been granite twenty-one years, wood (red) about seven or eight years, gritstone rarely more than five or six years in main streets, tar macadam in busy suburban roads over four years, and dry macadam entirely according to traffic and other considerations. Where wood was laid against tram rails the life was very uncertain. Pavement of this kind laid within the last nine months was already grooving, as well as gritstone and Inverkeithing laid about the same time. Within the last few years a whinstone from the Inverkeithing quarries had been introduced, and had found favour on account of its quietness and non-slipperiness. It, however, wore very rapidly, especially under traction-engine traffic or along tram lines. In one case, where it was laid under the latter condition, it wore ¾ of an inch below the level of the rails in less than twelve months. His experience tended strongly to prove that no material would stand next to tram lines but granite, and even that after a time became grooved. Referring to the tramway system, Mr. Wike mentioned that the company's lease ran out in 1896, when the Corporation obtained an Act authorising them to take over the working of the lines which had always belonged to them, the company paying a rent of 100*l.* per mile of route per annum. The first step was to introduce additional penny fares and to increase the distance traversed for that sum—a policy which met with immediate success. In September, 1896, a deputation visited a large number of English, Scotch, and Continental cities to inquire into the various systems of traction in use, and the unanimous conclusion was that the overhead electric system was the one for Sheffield—a view confirmed by the Council. In 1897 a further Act was obtained authorising the construction of about twenty-seven miles of additional tramway. Wherever practicable double lines were included, and the wisdom of this course had already been thoroughly proved. The estimate for the work, including electrical equipment, exceeded 600,000*l.* The actual work was started in January, 1898, and since then about eleven miles of route had been constructed. The power station was approaching completion, and a contract had already been let for an extension to more than double the original size, viz., 190 ft. by 110 ft. The first instalment of the generating plant now being fixed was of 900 horse-power. The whole of the works, except the erection of the car-shed and power-house, but including the electrical bonding of the track and the laying of pipes to carry the cables, had been carried out by the Corporation workmen. The Corporation management of tramways in Sheffield had been a great success from a commercial point of view. During the last year of the company's lease the results for the nine and a quarter miles of route were: Gross receipts about 40,000*l.*; gross profits, 7,441*l.* For the last financial year under the Corporation, with nine and a quarter miles for seven months and ten and three-quarter miles for the other five, the figures were: Gross receipts, 57,503*l.*; profits after allowing for service of debt, 13,884*l.* The Sheffield sewage works were at present on the lime precipitation principle. The quantity treated per day had reached as much as 25 million gallons, the average dry weather flow being about 17½ million gallons. One of the greatest disadvantages of this method of treatment was the quantity of sludge produced. In Sheffield this amounted to from 1,000 to 1,200 tons per week; and though liberal terms had been offered to farmers and others who might use it as a manure, very little was disposed of in that manner. The only practicable method of disposal had been found to be by sending the sludge by rail to a large tip in the valley some few miles below the works, and since 1892 about 250,000 tons had been so disposed of. It was divulging no secret to say the lime treatment only did not now receive the approval of the Local Government Board, and Sheffield was, therefore, at present experimenting. Lately these experiments had been in the direction of bacteriological treatment, and good results had so far been attained. The experiments commenced in November, 1897, when two of the precipitation tanks were filled, one with slack and the other with coke, and worked on this principle. The results were considered sufficient to justify a more extensive experiment. There were now three coarse tanks, each 220 ft. by 75 ft. and three fine filters through which the effluent from the coarse tanks was passed. The first tanks were filled with rough coke to a depth of 5 ft. The bottoms of the tanks were drained by one 9-in. main drain (open socket joints) in the centre and 3-in. land tiles 6 ft. apart laid herring-bone fashion at each side. These tanks worked on an 8-hour cycle as follows—filling 1¼ hours, 2 hours rest, 3 hours for emptying, remainder of 8 hours at rest. At present only two of the tanks were completed, with a capacity of one million gallons per day, and the third tank would take half a million gallons per day. After leaving these tanks the effluent passed through a secondary filter, of similar construction to the others, but filled with fine coke breeze to a depth of nearly 4 ft. Three hours were occupied in discharging the contents of the coarse bed into the finer one and after about 1⅓ hours rest the smaller tank was emptied into the effluent culvert. As these tanks had only been in work about two months it was not proposed to speak as to the cost of the treatment, but so far as the experiment had gone no sludge had been perceptible.

Street improvements had formed an important part of recent municipal work in Sheffield. Five years ago High-street was only 31 ft. wide in the narrowest part, but it had now been widened to a minimum of about 80 ft. at a cost of about 60,000*l.* net. The minimum price paid per square yard was 22*l.* (this being part of a special arrangement) and the maximum 103*l.*, neither of these prices including business compensation. The land resold as surplus realised from 25*l.* per yard (including a large proportion of backland) to 65*l.* and one lot, consisting of a few yards of frontage, fetched as much as 206*l.* per yard. It was found that in those cases where the Corporation purchased the whole of the property and resold the surplus the result was much more satisfactory than when they contented themselves with taking only the actual land required. Another important improvement was one known as the West Bar scheme, the total estimate for which was approximately 300,000*l.*, and the width of the improved street would be 60 ft. for the greater part.

The constructional works had included four new bridges, the clearing of an unsanitary area of about five acres, known as the Crofts, at a cost of between 80,000*l.* and 90,000*l.*, and the erection of dwellings on the flat system to house about 600 persons; of baths; of a branch free library; two additional police stations; and of two refuse destructors. These two destructors would on the average be capable of dealing with about 300 tons of refuse per day out of the 400 odd tons collected. It was proposed eventually to have a third destructor to consume 150 tons per day further.

Sheffield was probably as well supplied with parks and recreation grounds as any town in the Kingdom, and these were much appreciated in a city, parts of which were so smoky and densely populated. There were eight parks and seven recreation grounds with a total area of about 325 acres. One of the parks was given by the late Mr. Mark Firth, and another, togther with five of the recreation grounds, was given by the Duke of Norfolk. The remainder cost, in the first instance, about 70,000*l.* The three largest parks, with an area of 138 acres, had been acquired and laid out during the last ten years. One of the parks contained the public museum and the Mappin Art Gallery—the latter the outcome of a bequest by the late Mr. J. N. Mappin. In another park was the Ruskin Museum, founded in Sheffield by Mr. John Ruskin, and now transferred to and managed by the St. George's Guild and the Sheffield Corporation. No description of the parks would be complete without a reference to Norfolk Park, the largest park in the City. Although this was the property of the Duke of Norfolk it was open for the free use of the public, and was maintained entirely at the cost of the Duke. The annual cost of maintaining the parks and recreation grounds was only 5,500*l.*

Mr. J. P. Barber, Islington, proposed a vote of thanks to Mr. Wike for his paper. He said that every one knew that gritstone setts could not possibly stand very heavy traffic, neither were they economical. If a satisfactory road were to be made and maintained with heavy traffic, and true economy were aimed at they must use granite and discard gritstone. His experience in London was that the Guernsey or some of the Leicestershire granites were the most economical that they could obtain in the Metropolitan district. Even Guernsey granite setts became grooved in three or four years in thoroughfares over which there was heavy traffic. He was bound to say that the main thoroughfares of Sheffield were in no respect behind some of the best-paved streets in the Metropolis. It seemed to him that all the requirements of the traffic had been carefully considered and there had been skill and discretion in deciding as to the material to be used and great care exercised in the way that material had been laid down.

Mr. Mawbey, Leicester, who seconded, said he might add his opinion to that already given that the town could not do better than adopt the two kinds of paving which Mr. Wike was advising—granite and wood. Wherever they could afford the luxury of wood they preferred it. With regard to the bacteriological treatment of sewage, it was satisfactory to hear that the result of Mr. Wike's experiments were satisfactory. He believed there was a very great future indeed for the bacterial system. They had been carrying out some experiments at Leicester both with the clarification and the final treatment of sewage and they found that the rough beds for clarification had far exceeded any chemical treatment they had had anything to do with.

Mr. F. Baker, Middlesbrough, said that with the new overhead electric system of tramways between Middlesbrough, Thornaby, and Stockton, they had adopted a road gauge of 3 ft. 6 in. instead of the ordinary 4 ft. 8½ in., to keep the ordinary vehicular traffic from using the tram track.

Mr. Cooper, Wimbledon, stated that he was reforming a bacterial bed filter at Wimbledon which was constructed in 1876. The filter was formed of burnt ballast, and they found that the sludge had penetrated right through the ballast to the bottom of the filter, thus compelling them to clean it. He had besides two acres of filters laid with 3 ft. of burnt ballast with a little soil on the top to assist the distribution of the sewage; and he was engaged in laying down two more acres of filters which would not be quite so deep and would not have anything on the surface. He could not help thinking that the work of a filter was done on or near the surface, and that the work done in the first quarter of an inch was very much more than in the second quarter, and that as it got lower the efficiency fell very rapidly.

Mr. E. Pritchard, Birmingham, remarked that Sheffield had taken a bold leap with respect to the municipalisation of the tramways. Although the overhead system of electric traction might not be considered æsthetic he believed it to be the best for Sheffield. With regard to the gauge, he did not care what they did, whether they made it 3 ft. 6 in. or 4 ft. 8½ in., the butcher boys, who were the worst offenders, would run one wheel of their carts in the groove of the rail and cut up the track. The use of steel blocks alternately with wood by the side of the rail had the effect of preventing the cutting up of the track, but there was the disadvantage of the disagreeable noise made by vehicles.

Mr. J. Price, Birmingham, said he took it that the choice of pavement was a matter of policy to be determined by the Council, and not by the official, and depended upon whether the town could afford to pay for a certain class of pavement or not. A well-constructed granite pavement was the most economical pavement going; but if the circumstances permitted, and they could afford it, most of them would favour a good wood paving.

The Chairman said the experience of all of them was that, given a certain amount of heavy traffic, granite setts were distinctly cheaper, and they would probably be using granite setts where they now used wood in London but for the fact that they were a more neurotic people than they were in the North of England.

The vote of thanks having been passed,

Mr. Wike said he had to thank the members of the Council for the great support they had given him during the past ten years, and also the members of his staff who had worked exceedingly hard and conscientiously. The Corporation had in the highways staff a body of men who were thoroughly in earnest in doing their best for Sheffield.

The Lord Mayor then entertained the President and members of the Association to luncheon in the Town Hall. The postprandial proceedings were commendably brief, as the members had a long round of visits to make to places of engineering interest.

The visits made during the afternoon included the tramways in course of construction in Fitzalan-square, the tramway power station at Kelham Island, Ball Bridge, the Walkley tramways, the Glossop-road baths, the destructors, the sewage works, where tea was provided, and the Brightside baths. The inspection of works in progress and completed proved of the greatest interest, and the meeting in every respect was a complete success.

◆

## THE BUILDING TRADE DISPUTE.

ON Saturday last special meetings were held in many of the London and provincial branches of the National Association of Operative Plasterers, when the members were handed ballot papers, on which they were requested to record their votes either for or against the settlement arrived at on the 30th ult. between the representatives of the masters and the men's delegates. It is considered certain that the operatives will sanction the settlement of the dispute on the lines already agreed upon. Should the result prove to be in favour of returning to work, an intimation will be immediately sent to the Master Builders' Association, who will then throw open their shops to the Union men. It is therefore highly probable that the lock-out order will be withdrawn on June 12.

A joint meeting of members of the National Association of Master Builders and representatives of the several trade unions in the industry was held on Monday in Derby. The meeting had been arranged for the purpose of the preparation of a basis of discussion for a larger conference proposed to be held in London on Thursday; but no basis has been prepared. The terms of settlement as agreed upon at the conference with the Operative Plasterers were, with some minor alterations, laid before the representatives. The representatives of the Master Builders' Association, having already accepted these terms as applied to the Operative Plasterers, were prepared to practically adopt them as the basis for discussion at a conference with the whole body of trade unions. The representatives of the trade unions, however, after they had gone carefully through the proposals, which, it was understood, included the appointment of Mr. E. T. Cook as an independent chairman, decided, it is stated, that they could not adopt them as a basis. The terms, as accepted at the conference with the Operative Plasterers in London, and as confirmed by the statement issued by the Yorkshire employers, practically allege certain practices against the whole of the unions, and that these practices are universal the governing bodies of the unions deny. Their representatives, in fact, at a meeting held in Manchester on May 15, "condemned in the strongest possible terms the untrue and misleading statements issued by the Yorkshire Federation of Building Trade Employers." Their representatives accordingly declined to discuss terms of settlement which would apply to allegations of practices the truth of which they denied.

A considerable number of members of the National Association of Master Builders travelled to Derby and met at the Midland Hotel, where the "preliminary joint meeting" with some of the representatives of the trades unions was also held. The joint meeting was attended by three members only from either side, with the secretaries—namely, Messrs. B. Greenwood (London), R. Neill (Manchester), W. Nicholson (Leeds), and J. Hassal, secretary, employers; and W. T. Wilson (Amalgamated Society of Carpenters and Joiners), W. Matkin (General Union of Carpenters and Joiners), J. Batchelor (Operative Bricklayers' Society), and G. B. Cherry (Operative Plumbers' Association), secretary. The decision of the representatives of the trade unions not to accept the proposed basis of discussion was communicated to the representatives of the employers. The representatives of the trade unions desired as a simple basis for discussion a proposal for the establishment of a Joint Central Conciliation Board to which all local disputes might be referred. This, it was thought, would allow the several districts to retain their local autonomy, and would at the same time provide a safeguard against the local adoption by either side of measures calculated to presently jeopardise the interests of the whole industry. When it was apparent that the representatives of the trade unions were not disposed to adopt the proposed basis of terms of settlement for discussion, the following resolution was adopted by the joint meeting:—

> "That, inasmuch as the representatives of the trade unions are not willing to adopt the proposed basis of conference, they be requested to submit within fourteen days their own basis for the consideration of this Association (the Master Builders' Association), and that this Conference be postponed accordingly."

A meeting of the Council of the Yorkshire Federation of Building Trade Employers was held at the Montgomery Hall, Sheffield, on the 6th inst. The attendance included representatives from all the centres covered by the Federation, and the chair was taken by the President (Mr. John Spink, of Sheffield).

The first business was the reception of the report of the Plasterers' Settlement, and the meeting expressed general satisfaction with the understanding which had been arrived at. The abortive attempt at Derby on the preceding day to settle the basis of discussion at the proposed London conference next came under discussion. Individual members expressed the opinion that the resolution of the Manchester conference of trade unionists suggesting a meeting with the federated masters was merely a device to prevent a national lock-out. This feeling was afterwards embodied in the following resolution:—

> "The Yorkshire Federation of Master Builders are of opinion that the operatives, at their Manchester meeting, when they proposed—'that we are prepared to meet the National Association of Master Builders in open conference, and discuss the questions at issue'—were not making a bonâ fide offer for a conference, because the men's delegates at Derby yesterday refused to accept, as the basis of that conference, the suggestions made by Mr. Cook, the editor of the London *Daily News*, who is an independent and impartial intermediary."

It was reported that the representatives of the trade unions were to meet in Manchester on Monday to prepare a basis for any conference between them and the National Federation of Employers, and in view of this it was resolved to ask the Northern Centre of the employers to hold a meeting as soon as convenient after the proposals of the men are made known.

The lock-out in Yorkshire, it was stated, would be maintained until some satisfactory understanding is come to with the men on the question of a general conference. The reasons given for declaring a lock-out in Yorkshire, as stated in the employers' manifesto, were that the men had imposed "tyrannical practices" upon the masters. The meeting had before it a list of these alleged practices, and resolved to print and publish them throughout the country, every instance being stated to be fully authenticated. The following examples are extracted from the list. In fairness it should be stated that the masters are in each instance possessed of the name and place of business of the employer or employers concerned:—

> "A firm of contractors erected a steam mason. The men immediately struck, and demanded that the machine should be taken out of the town. After considerable pressure by the local Master Builders' Association, terms were made restricting the output, as follows:—(1) The machine was not to be worked if six masons were not employed; (2) no overtime whatever to be allowed; (3) the machine only to plane three sides of any one stone, and do no moulding work whatever; (4) if the men be stood for work at any time, the machine must not be working.
>
> Of the men employed on a contract in the East Riding, part lived near the work and the remainder were engaged from an adjoining town. The latter, in order to catch a train on Saturdays, ceased work at twenty minutes to twelve, and insisted that the local men, who were within three minutes of their homes, should leave at the same time, under penalty of the job being stopped.
>
> Some time ago the whole of the master joiners in Hull were forbidden to use Canadian pine doors, the reason given being that they were made under unfair conditions of labour. A strike was threatened in the alternative. The employers have since ascertained that the men engaged in making these doors earn four guineas a week.
>
> A joiner in the employ of a firm for twenty-one years was during that time appointed in succession outdoor and general foreman. On his receiving the latter berth, ninety-two joiners struck work for three weeks because he would not join their union. He then gave way and joined the Society, but was fined 2*l.* for not having done so at once.
>
> A builder was compelled to discharge a non-society plumber under threat of a strike of joiners, plasterers, and labourers.
>
> Five labourers, who were employed to supply three bricklayers, failed to keep them going. After the foreman had complained two or three times

two of the labourers were discharged. Two of the remaining three left at an hour's notice, and used bad language to the employer before going. They returned, along with the labourers' delegate, who complained that the contractor was working short-handed. He offered to take back the two men whom he had discharged, but the delegate insisted that he should first reinstate the two men who had left work on their own account and had insulted him. On this, the employer refused to take any of them back, and the delegate refused to allow any man to start on the job.

A contractor became embroiled with a labourers' society because of employing temporarily on a chimney shaft four non-union men with special knowledge of the work. As a matter of fact, the men were desirous of joining the Society, but were refused admission, on the ground that the whole of the existing members were not then at work. The men had to be discharged.

The lock-out is now declared to be in force in every principal town in Yorkshire, with the exception of Bradford. The Federated Masters have received from the architects, it is stated, an assurance of sympathy, the latter expressing the view that they ought to extend the lock-out to the whole of the men.

◆

## *ARCHITECTURAL SOCIETIES.*

THE ARCHITECTURAL ASSOCIATION OF IRELAND.—A general meeting of the Irish Architectural Association was held at the Grosvenor Hotel on Wednesday, May 31, Mr. J. H. Pentland in the chair. The Hon. Secretary read the result of the ballot for officers for the ensuing session as follows:—President, Mr. G. Sheridan, A.R.I.B.A.; Vice-Presidents, Mr. J. Halloway, Mr. M. J. Tighe; Committee, Messrs. Orpen, J. Pentland, R. M. Butler, T. E. Hudman, T. Coleman, L. O'Callaghan, C. H. Ashworth, F. Batchelor, Wm. Scott; Hon. Treasurer, J. H. Webb; Hon. Librarian, J. Geoghegan; Hon. Secs., H. Allberry, F. Hicks; Hon. Auditors, W. Sandall and J. W. Boucher. Mr. Pentland delivered a short valedictory address. The term of office of Mr. Butler, the Hon. Secretary, having expired, a vote of thanks to him was proposed by Mr. Allberry, and seconded by Mr. P. F. O'Sullivan, for the energy and attention with which he had directed the affairs of the Association since its inauguration in 1896. It is proposed that the Association visit Chester for their annual excursion and dinner on Friday, June 30. The following new members were admitted:—Messrs. G. G. Lynes, J. Baird, H. J. Lundy, J. M. Mitchell, Wm. Conolly.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Members of this Association visited Arbroath on Saturday last on the occasion of their annual excursion. The President, Mr. James Bruce, W.S., the past president, Mr. Thomas Ross, and the secretary, accompanied by about thirty members, proceeded by train to Elliot Junction, and walked to Kelly Castle, now the country residence of Lord Provost M'Grady. The party proceed to examine the Castle, which is situated about two and a half miles from Arbroath on the River Elliot. The oldest portions, built about 1442 by Sir William Ochterlony, have been much added to and altered, and the building now is a picturesque and comfortable house of red stone, having a fine walled-in garden with yew hedges 4 ft. 6in. thick Luncheon was provided by Lord Provost M'Grady, and the President asked Mrs. M'Grady to be good enough to convey to him the thanks of the Association for permitting the visit, and for his hospitality. Under the leadership of Mr. T. S. Robertson, the party then visited Hospitalfield, the original of the Monkbarns of "The Antiquary." The parish church and the Abbey were next examined. The well-known abbey was founded in 1178, and the latest additions were added early in the fifteenth century. The Rev. W. Duke accompanied the members from the abbey to his church of St. Vigeans, built on the site of a Norman church, and restored twenty-seven years ago by Mr. R. Rowand Anderson, LL.D. Mrs. Duke provided refreshments, and after Dr. Duke and the hostess had been thanked the party returned to town.

◆

CLOCK TOWER ON THE EASTGATE, CHESTER.—A clock tower has been erected on the Eastgate, in commemoration of the Diamond Jubilee, and on the 24th ult. the clock was started. The tower, which is of ornamental ironwork, was designed by Messrs. Douglas & Minshull, of Chester, the clock having been supplied by Messrs. Joyce & Co., of Whitchurch. The ironwork of the tower was executed by Mr. James Swindley, of Handbridge.

# Illustrations.

## MODEL FOR THE STATUE OF BALZAC.

WE give an illustration of the plaster model by M. Falguière for the proposed statue of Balzac, which occupied a prominent position among the sculpture in the Old Salon this year, as that of M. Rodin occupied a prominent position in the New Salon the previous year.

It may be remembered that the commission for a monumental statue to the author of the "Comédie Humaine" was in the first instance given by the "Société des Gens des Lettres" (the promoters of the monument) to M. Rodin, who, after keeping them waiting some years, produced only the rough and almost grotesque sketch which figured in the New Salon last year, and became a *casus belli* in the artistic world. There was indication, as we have always thought, of a fine and original conception underlying M. Rodin's sketch; but the "Société" not unnaturally lost all faith in a sculptor who displayed such eccentricity of temper and aims, and took the commission out of his hands in favour of M. Falguière, a sculptor in whose saner genius and more rational temperament they could at all events feel confidence.

The result is, we think, a success, and is generally considered to be so in Paris, except by the adherents of "sculpture intellectuelle," which appears to mean unfinished sculpture. The model, which is the full size of the intended work, is colossal in scale, and represents Balzac in an attitude of deep thought, his hands clasped over one knee. The drapery is broadly treated, and there is a sculpuresque repose and dignity in the work.

As at present intended, the completed work will be erected in the Place du Palais Royal, an appropriate situation enough, since it was the centre of life of the Paris which Balzac analysed and satirised in his wonderful series of stories.

## ST. SAVIOUR'S MISSION CHURCH, EALING.

THE illustrations show the interior view looking east and the exterior view from south-east of the above-named church, which is to be consecrated on Wednesday, June 14, by the Bishop of London. The interior view was exhibited in the Royal Academy in 1897. The main object of the design has been to get a lofty and effective building that would accommodate about 1,000 adults at a very reasonable cost, and to trust to the general massing and proportion rather than to detail for effect; in fact, all elaborate ornament (except only in the case of the chancel arch and rood beam) is dispensed with, and moulded work is confined almost entirely to strings and labels.

The main form of the plan is a nave 113 ft. long by 40 ft. wide, divided into six bays of 18 ft. centres. Broad processional passages are placed on either side, and north and south transepts are thrown out from the two easternmost bays, that on the south side terminating in an apsidal-ended chapel, and that on the north side in a lofty arch opening into organ chamber. An apsidal-ended baptistry is placed at the west end of the nave.

The chancel is 46 ft. long by 29 ft. wide, with an altar raised nine steps from the nave floor level. Wide passages for returning communicants are placed north and south of the chancel, and above them are formed the organ-chamber on the north side, and musicians' gallery on the south side. Spacious clergy and choir vestries are placed on the north side, with heating chamber under. The nave walls are splayed in towards the jambs of the chancel arch, and upon this splay are placed twelve niches, with canopies over for figures of the twelve Apostles, and a stone screen, with wrought iron grille work above, divides the chancel from the nave. An elaborately carved oak rood beam is placed at the springing of the arch, upon which is placed the figure of the Crucified Saviour and attendant figures. A richly worked dossal carried to a height of 20 ft. above the altar, also curtains at the east wall, on either side, give dignity and warmth to the east end.

The roof is of barrel form, being carried at one level through nave and chancel, and gives ample scope for future decoration. At present the whole of the timber and boarding in the roof is stained green, with not unpleasing effect. The heating is by hot water, with radiators and pipes upon the low pressure system.

The church being hemmed in on all sides by dwellings of the poorer class, the external elevations have purposely been kept severely plain. A copper covered flêche, which is placed at the junction of chancel and nave roofs, is carried to a height of 46 ft. above roof, and is a conspicuous object at some considerable distance from the church.

The materials used internally are red brick and stone facings, and externally stock brick.

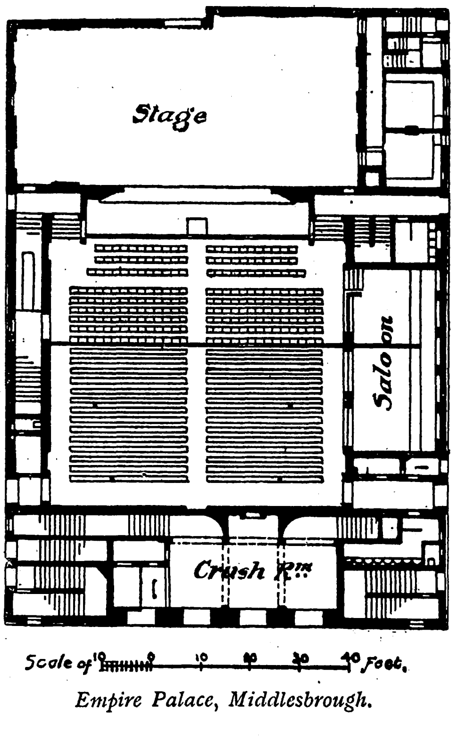
The church and all detail work has been carried out from the designs of Mr. Geo. H. Fellowes Prynne, of Westminster; Messrs. Goddard & Sons, of Farnham, being the contractors.

The figures and carving work have been done by Messrs. Martyn & Son, of Cheltenham; the dossal and altar hangings by Mr. A. Stalman, and the heating by Messrs. J. Jones & Sons.

The cost of the church, complete with fittings, will be about 11,000*l.*

## EMPIRE PALACE OF VARIETIES, MIDDLESBROUGH.

THE site selected for this building covers an area of upwards of 11,000 square feet, having frontages on three sides to Corporation-road, Pine and Dunning-streets, and a frontage to a right-of-way in the rear; being thus practically isolated. The main approach is from Corporation-road through a hall, 34 ft. by 19 ft., and 18 ft. in height, having a large recessed fireplace; at the left-hand side upon entering is the box-office, adjoining which is the staircase to the stalls, whilst on the right is a broad staircase leading to the grand circle; in addition there are two emergency exits from the stalls into Dunning and Pine-streets, and an emergency exit staircase from the grand circle into the former thoroughfare. The pit entrance is from and on a level with Dunning-street, with an emergency exit opposite directly into Pine-street, whilst the gallery entrance is from the latter street, with an emergency exit into Dunning-street.



*Empire Palace, Middlesbrough.*

The auditorium is nearly square, being 60 ft. in width by 63 ft. deep, and the average height to the false ceiling is 45 ft. The area comprises 120 orchestra stalls, 120 stalls, and a pit with a seating accommodation of about 450. Spacious saloon accommodation is provided. The grand circle has seating accommodation for 150 persons, with ample lounges. Immediately in the rear over the entrance hall is the principal saloon, 34 ft. by 27 ft., approached by two short flights of steps, thus enabling a clear view of the stage to be obtained. A further saloon is also provided on the Dunning-street frontage. Both the entrance and exit staircases terminate in roomy lobbies, and there are communication staircases directly into the stalls from either side. Four private boxes flank the proscenium, and on the gallery level are two private boxes. The gallery itself has seating accommodation for 750 persons, and a suitable saloon is provided in the rear.

The ceiling, proscenium, circle, and box-fronts are in specially designed and modelled plastic work, following in a degree the Spanish Renaissance treatment of the exterior. The ceiling is painted with allegorical subjects. The principal seats are of the tip-up pattern and upholstered in velvet, and the pit seats upholstered in leather. The stage and its accessories are roomy, and will permit of spectacular productions of all kinds. Its dimensions are as follows:—Width from wall to wall 70 ft., average depth 35 ft., height to flies 25 ft., height to grid 55 ft., proscenium opening 30 ft. square. Six dressing-rooms are provided, entirely distinct from the stage and in a separate block, each room being fitted up in the most approved manner. The stage entrance is from Dunning-street, and the scenery entrance in the rear of the building.

Messrs. Ernest Runtz & Co. are the architects.

A drawing of the building was exhibited in the Royal Academy in 1897.

## *COMPETITIONS.*

HOSPITAL, SWINDON.—The Swindon and District Hospital Board have accepted the joint plans of Mr. G. Halliday, F.R.I.B.A., and Mr. J. W. Rodger, of Cardiff, for the building of a hospital at Swindon, and have sent instructions to the architects to prepare the necessary drawings to carry out the work.

WANDSWORTH BOARD OF GUARDIANS OFFICES.—The Guardians have examined the designs sent in (twenty-eight sets in all) with the assistance of Mr. A. Graham, the assessor, and it was agreed that the first premium of 100*l.* be awarded to No. 25, second of 60*l.* to No. 12, and third of 40*l.* to No. 20. The clerk was instructed to open the sealed envelopes containing the names of the premiated authors. No. 25 was by Mr. Cecil A. Sharp, A.R.I.B.A., of 59, Fenchurch-street; No. 12 by Mr. N. F. Harber, 35, Craven-street, Strand, W.C.; and No. 20 by Mr. W. Nash, F.R.I.B.A., Bush-lane House, Cannon-street, E.C. The architect's estimated cost of the work is 20,311*l.*

## *ARCHÆOLOGICAL SOCIETIES.*

EAST RIDING ANTIQUARIAN SOCIETY.—The first summer meeting of the East Riding Antiquarian Society was held on the 31st ult. About thirty members took part in the excursion. The party left York railway station in waggonettes shortly after 11 o'clock, the route being Stillingfleet, Cawood, and Ryther. Upon arrival at Stillingfleet the party proceeded to the church, which was described by Mr. Hodgson Fowler, by whom the building was restored about twenty years ago. The style of architecture is Norman, and the most remarkable features are the porches and the doorway, which is of the original oak and fine wrought ironwork. Ryther church was also described by Mr. Fowler. This ancient edifice came into history as early as A.D. 869, when the Danes sent an expedition to clear away the forest and settle down there. In Edward the Confessor's time the owners of this land were Danes, and there was a church and a priest at that time. Perhaps the most noteworthy features of the church are the beautiful monuments of the Lords of Ryther. From Ryther the party proceeded to Cawood Castle, where the Rev. E. Maule Cole read descriptive notes by the Dean of York. They also visited the Old Manor House, which was built by Archbishop Gray and seized by Edward I., who lived there with his Queen. Cawood was restored to the Church in the time of Cardinal Wolsey, who was living there at the time of his arrest. During the Civil Wars the castle was so well defended that by order of the House of Commons it was demolished to prevent it causing any further trouble, and all that remains is an archway. The church at Cawood contains but one monument, and that was erected to the memory of Archbishop Mountain, a Cawood boy who raised himself to the position of Primate of the Northern Province. After the inspection of Cawood the return journey was begun, and the party reached York Station about five o'clock.—*Yorkshire Post.*

## *ENGINEERING SOCIETIES.*

SOCIETY OF ENGINEERS.—At a meeting of the Society of Engineers, at the Royal United Service Institution, Whitehall, on the 5th inst., Mr. C. Fell, President, in the chair, a paper was read by Mr. R. G. Allanson-Winn, entitled "Fore-shore Protection, with Special Reference to the Case System of Groyning." In introducing the subject the author referred to the advantages of utilising the destructive forces of the sea for constructive purposes, and stated that his object was rather to give an account of what had actually been accomplished in that direction than to advance his own opinions or theories. Dealing with the question of changes constantly going on in the configuration of the country, he took as an example thirty miles of the Yorkshire coast, and calculated that, at a moderate computation, over 47,500,000 cubic ft. of material were annually taken from the coast beween Flamborough Head and Spurn Point. Where did it all go to? Much was doubtless deposited at the mouth of the Humber, greatly to the detriment of that estuary, and probably more was carried down southward by the flood tide and deposited, along with material eroded from the Lincolnshire coast, in the Wash, which was gradually silting up. The erosion, in the shape of falling cliffs, was noticed now and taken account of; what did not so readily meet the eye was the gradual deposit beneath the sea, and this accretion of silt would suddenly show itself some time next century when, possibly, 100,000 acres of land in the Wash would suddenly, by comparison, spring into existence and be added almost at once to the acreage of England. Taking one century with another we did not probably gain or lose much of our area. The addition of 100,000 acres in the Wash alone would make up for a good many years of cliff erosion. Having briefly quoted certain conflicting opinions on the moot point of the travel of beach at various depths, the author endeavoured to show that, as Dungeness Point was steadily moving out into 100 ft. of water, there was strong evidence that shingle, of which the point is entirely composed, is capable of motion in water at least 100 ft. in depth. Allusion was then made to the unprecedented encroachment of the sea during the past year at Glenbeigh, on the southern shore of Dingle Bay, co. Kerry, an average of 120 ft. being recorded for a distance of over 2,000 ft. The problem here involved the protection of about 600 acres of land and some house property. The situation was one of exceeding gravity, and it had been decided to put in the groynes invented by Mr. Edward Case, of Dymchurch, because this system of low groyning had been so successful at other places where the natural difficulties were greater. Having alluded to the usually accepted methods of dealing with the question of foreshore protection, Mr. Winn pointed out that these oft-repeated and usually accepted methods had frequently met with but indifferent success, and that until Mr. Case brought out his system no one had ever promulgated a scientific theory as to the curve at which a shore should lie, or devised a simple and inexpensive form of groyne which should cause the sea itself to build up that shore to its required curve surface of repose. Mr. Case was able, by means of tables which he had constructed and the due consideration of certain details, such as range of tide, nature of shore, sections, &c., to build up any shore, save only an actually rock-bound coast, to an angle at which it would lie with the minimum chance of erosion or alteration of form. The paper was illustrated by diagrams showing, by means of sections, the actual gains at Dymchurch, Deal, Southwold, Lowestoft, and Sheringham—which places were selected from a great many where the system had been successfully applied. The author contended that the invention was to be recommended by reason of its theoretical soundness, its practical utility and economy, and by its success.

WESLEYAN CHURCH, GOSPEL OAK.—The memorial stones have just been laid of the New Wesleyan Church, now in course of erection on a site at the corner of Agincourt-road and Lisburne-road, Gospel Oak. The new church, the architect of which is Mr. Beresford Pite, is octagon shaped, and is of red brick with stone dressings. The main frontage will be to Agincourt-road. It will provide seating accommodation for 800 worshippers. In addition to the main building, a church parlour and minister's vestry will be provided.

## METROPOLITAN ASYLUMS BOARD.

THE fortnightly meeting of the Managers of the Metropolitan Asylums District was held on Saturday at the County Hall, Spring-gardens, Sir Edwin H. Galsworthy, the Chairman, presiding.

*The Projected Southern Hospital.*—A letter was read from the Local Government Board suggesting, in view of the probable heavy cost of the Southern Hospital as at present designed, a conference between representatives of the Managers, their architect, and the Board's officers. The letter was referred to the Works Committee, and it was resolved to send on to the Local Government Board the drawings of the foundations of the proposed hospital, prepared by Messrs. Treadwell & Martin, architects, together with the architects' approximate estimate of the cost of the proposed hospital buildings. The hospital is designed for 720 ordinary and eighty infirmary beds, and the approximate estimate amounts to 227,454*l.* The following works will form the subject of a supplementary estimate:—Boiler-house, and destructor and works in connexion therewith, engineering works, heating, hot-water supply, and electric or gas lighting, making up roads and paths, laying out grounds, &c., water supply so far as it relates to the well, water-tower or water-softening apparatus, laundry and kitchen engineering fittings and apparatus.

*A Hackney Improvement.*—A letter from the Vestry of Hackney asking for a contribution towards the 5,000*l.* needed to widen College-lane, Homerton, was referred to the Committee. The widening would facilitate the ambulance service of the Managers.

*The Proposed Theatre at Hampstead.*—It was resolved to protest against the proposed erection of a theatre on a site adjoining the North Western Hospital at Hampstead.

*The Paris Exhibition.*—It was agreed to spend 400*l.* on models of the North-Eastern Hospital and the Brook Hospital for the forthcoming Paris Exhibition.

*New Ophthalmic School.*—The Managers agreed to send on to the Local Government Board for approval the finished plans prepared by Messrs. C. & W. Henman, architects, for the erection of the proposed High Wood School at Brentwood for the accommodation of ophthalmia children. The approximate estimate of the cost of the buildings was reported to be 106,600*l.*

*Hospital Laundries.*—The Works Committee reported that, in the light of recent experience and advice, they had come to the conclusion that the proposed laundry buildings for the North-Eastern Hospital would admit of considerable modification and simplification, which would not only decrease the cost, but also admit of the laundry being more economically administered and more efficiently supervised. Messrs. A. & C. Harston, the architects, had accordingly prepared amended plans of the proposed permanent laundry, the total cost of which they estimated at 13,455*l.*, as against 14,450*l.*, which was the estimated cost of the plans previously approved by the Managers. The Committee also proposed a similar change in the plans of the new Joyse Green Hospital laundry, which were approved nearly two years ago. The specifications for the remaining portions of this hospital being now in the hands of the quantity surveyor, the Committee were anxious that the varied plans for the laundry should be at once approved, so that no further delay should take place in inviting tenders for the erection of the hospital.—The Managers assented to the change at Joyse Green, but postponed the consideration of the new plans for the laundry at the North-Eastern Hospital.

*Appointment of a Surveyor.*—The Works Committee recommended that Mr. Charles Edward Dance should be appointed Surveyor to the Board, at a salary of 500*l.*, with travelling expenses, office accommodation, and all necessary assistance. Mr. Dance has for ten years been building surveyor to the Great Northern Railway Company. Mr. Dance was articled to Mr. Goymour Cuthbert, A.R.I.B.A., and subsequently acted as assistant surveyor of works to Messrs. Peto Bros. Several members raised the question whether an architect instead of a surveyor should not be appointed, but the Chairman pointed out that this question had been settled at a previous meeting, and the appointment was sanctioned.

*St. Anne's Home, Herne Bay.*—It was resolved to erect an isolation block at this institution, but the details of size and construction were left to the Children's Committee for further consideration.

*Homes of "Remand" Children.* — It was agreed to purchase, for the purpose of one of the institutions to be created for children remanded by the magistrates, the three houses in Pentonville-road, with workshops, formerly occupied by Dr. Stainer as a home for deaf and dumb children. It was reported that the whole property is in a very dilapidated condition, and would need extensive repairs.

## LONDON BUILDING ACT, 1894.

### TRIBUNAL OF APPEAL AND THE DIAGONAL LINE.

THE Tribunal of Appeal under the London Building Act, 1894, sat at the Surveyors' Institution, Great George-street, Westminster, on Friday, the 2nd inst., the members present being Messrs. Arthur Cates (Chairman), A. A. Hudson, and J. W. Penfold. The appeal before the Tribunal was that in which Messrs. Hunters & Haynes, on behalf of Mr. Alfred Charles Stock, sought to overrule the decision of the London County Council, which body had declined to sanction the extension above the diagonal line mentioned in Section 41 of a portion of a building — the "Globe" public-house, Marylebone-road—which it is proposed to rebuild. On the further amended plans prepared by Mr. W. A. Scrymgour, an open space was shown at the rear of the building, but the County Council determined not to sanction these "as the Council is not satisfied that there will be provided at the rear of the proposed building such an open cubic space of air as will in case of such extension be required by the last proviso in Section 41 of the Act and it appears, moreover, that the open space proposed to be provided in the rear of such building is not such as to comply with the said Section 41."

Mr. R. D. B. Acland, barrister, appeared for the appellant, and Mr. Seager Berry on behalf of the London County Council.

From the statement of the learned counsel for the appellant it appeared that it was proposed that the public-house in question should be rebuilt on the site of the present building, 47, Marylebone-road, with the addition of 43 and 45, Marylebone-road and 21, York-place. The "Globe," in its new form, would assume the proportions of an hotel, forming the sides of a square block of buildings, facing on one side on York-place and on the other on Marylebone-road. It was proposed that the front should face on York-place. The site in question was at the north-west corner of a block of buildings and the portion of the site which the Council had refused to sanction was on the north side, and would, therefore, not materially affect the access of light or air to the space at the rear of the block. The surrounding buildings consisted of Portman Mansions, which were erected by Mr. W. A. Scrymgour, the architect who had prepared the plans for the rebuilding of the "Globe" Hotel. Portman Mansions were held on a long lease, the term being co-terminous with the lease of the site on which Mr. Stock proposed to rebuild his hotel. There was no probability of any alteration being made to the Portman Mansions. It was proposed that a portion of the new building should extend above the diagonal line referred to in Section 41 of the Act, and by the last proviso of that section the County Council or the Tribunal of Appeal must, under the circumstances, be satisfied "that an open cubic space of air will be provided at the rear of such building, equivalent to the open cubic space which would have been provided at the rear of such building if such diagonal line had been drawn from the ground level in the manner provided in Sub-section 1 (iii.) of this section, and if no part of such building had extended above such diagonal line." According to the proposed plan a greater amount of cubic air space would, urged Mr. Acland, be allowed at the rear of the proposed building than would be provided if no portion of the building were raised beyond the diagonal line, in which case it would not have been necessary to have applied to the County Council at all to obtain their sanction to the plan. This would be realised from these figures. If the building were in an entirely new street, the total cubic space to be provided would be at the outside 103,417, but in view of the fact that by Sub-Section 2, Section 41, it was provided that in the case of a new building erected in an old street the horizontal line from which the diagonal line was drawn should be drawn throughout at a level of 16 ft. above the level of the adjoining pavement, the total amount of cubic space to be provided was 71,492 cubic feet. As a matter of fact, in the plans submitted by the appellant the total cubic space provided was 104,420 cubic feet. Counsel submitted, therefore, that the open cubic space of air would be provided at the rear of the building equivalent to the open cubic space which would have been provided if the diagonal line had been drawn from the ground level in the manner provided by Sub-section 1 (iii.) of Section 41, and if no part of such building had extended above such diagonal line. On these grounds counsel submitted that the appellant was entitled to erect the building as proposed.

Mr. W. H. Scrymgour, architect, gave evidence in support of counsel's statement, and entered into an exhaustive calculation as to how the 104,420 cubic feet of space was arrived at.

Mr. Seager Berry contended that these conclusions were not accurate. The Council refused their sanction because of the unsatisfactory totals arrived at after calculations had been carefully made.

In the result, the Chairman said the Tribunal had decided to allow the appeal. They came to this decision entirely on the merits of the case, and did not intend it to be regarded in any way as fixing a principle. Quite conceivably there might be cases in which it would be desirable to take into account the space below the diagonal line. No order was made as to costs.

## REMAINS OF CONVENTUAL BUILDINGS, BRISTOL.

SIR,—Having been born under the shadow of Bristol Cathedral, some memoranda of my recollections may be of interest to your readers as illustrating Mr. Paul's sketches. You are, perhaps, aware that what is now called the Lower Green was evidently formerly the Abbey farmyard; and the Norman doorway, so well drawn by Mr. Paul, led from the farmyard direct to the Abbot's house, burnt at the riots, and now called the Bishop's Palace. This passage crossed the small cloister of which there are no remains; but the site is well marked, and above it I found, in a room over the cloister, clear marks of the divisions of the cubicles, which proved it to have been the infirmary, having access, most probably, to the small cloister by a staircase, and placed upon one pair so as to avoid the damp and fogs of the marsh. I also discovered, in rebuilding Canon Norris's house, what was then supposed to be a subterranean passage, but was evidently the main sewer of the Abbey, running to the river from the kitchens and other monastic buildings. But by far the most interesting remains were in what we used to call Canon Bank's house, situated to the south-west corner of the Abbey area and pulled down by Dean Elliot, who was a very clever, practical man, as he remarked it would then tell no tales. In this house, I have always heard, were remains of the piers at the west end of the nave and other interesting work. The house stood upon the site of the Prior's lodgings and the "Sala Regia" where distinguished visitors were lodged, and contained, I am informed, many interesting remains of the monastery—among others, the western piers of the nave.

Mr. E. Godwin made some drawings of it, but where they now are I cannot say. Nearly everything has now been removed to make a new road to the Docks, which has certainly the merit of throwing open the view of the south side of the Cathedral. A room with a fine early chimney-piece occupies the space over the Newton Chapel, and is called the Pigeon-house.

T. S. POPE.

## WANDSWORTH OFFICES COMPETITION.

SIR,—After certain correspondence with the Clerk to the Guardians, with reference to an advertisement in your journal, we were eventually informed that a professional assessor would be appointed to adjudicate upon the designs submitted by competing architects, and in consequence of this we delivered a design on the date specified.

We have now had our entrance-fee of two guineas returned to us with an intimation that our drawings will be returned to us on application, but without any mention whatever being made of the assessors' name nor of those to whom premiums have been awarded, and no public exhibition of the designs appears to have been held in order to afford an opportunity to the competing architects and those interested of inspecting the designs submitted.

Under these circumstances it would almost appear doubtful whether an assessor has had the control of the competition, as surely he would have considered it his duty to have so advised the Board that his professional brethren would have been treated with more consideration.

## ARCHITECTURAL HYGIENE.

### XXI.—LIGHTING.

THE beneficial effect of sunlight upon the health of the human being is a matter of general knowledge, and it is recorded that the Romans of old used to indulge in *Solaria*, or baths of sunlight.

Modern medical authorities insist so strongly upon this necessity of sufficient light for the healthy condition of the human body that it behoves us to bestow more care upon this important subject than is usually given to it. Lighting may be conveniently considered under the following heads:—

1. *Solar light.*
2. *Assisted natural lighting.*
3. *Artificial lighting.*

### I. SOLAR LIGHT.

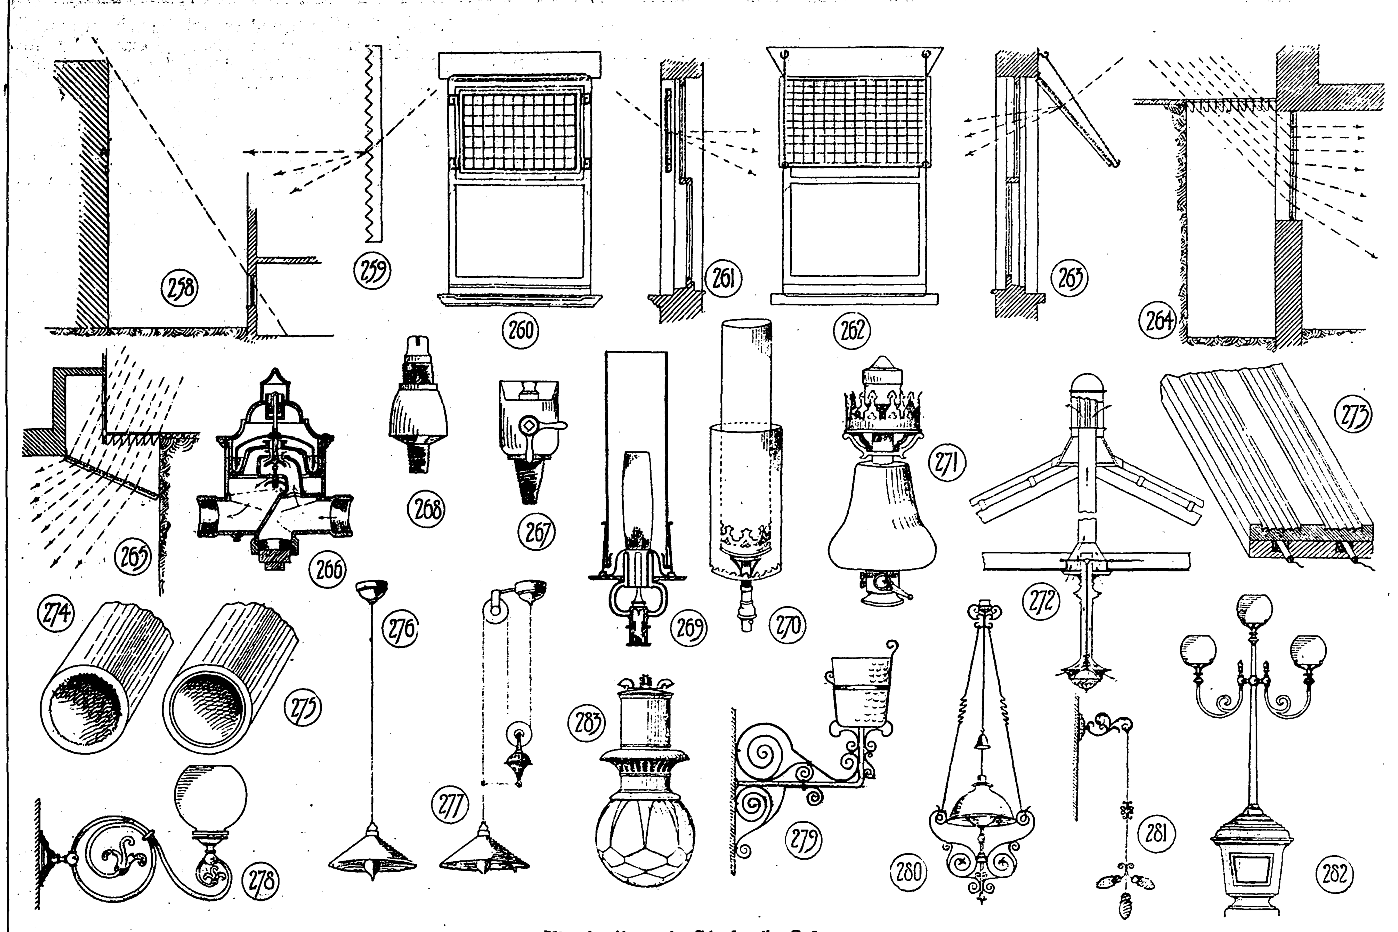
This was discovered by Newton to be a mixture, the whiteness of which is due to the proportions of its ingredients. By means of a prism of glass he threw a luminous band of light upon a screen, and this band was found to contain the following colours:—Red, green, violet, orange, yellow, blue, and indigo. The first three are the *primary* colours, and the others are an admixture caused by the overlapping of the adjacent bands in the prismatic spectrum. When an object is called a particular colour we mean that it gives free passage or reflection (as the case may be) to that particular colour or mixture of colours, and that it arrests or absorbs the remaining colours. Certain combinations and contrasts of colours are pleasing to the eye, and, according to Professor Barff, these are only existent when their combination, taken collectively, make up white light. When two or more colours of the spectrum by being blended together produce white light, such colours are said to be *complementary* of each other.[1]

Under this heading of solar light we will now consider:—

(*a*) *The question of the admission of solar light to buildings.*
(*b*) *Relative proportions of windows.*
(*c*) *Positions of windows.*
(*d*) *Glazing.*

(*a*) *The Question of the Admission of Solat Light to Buildings.*—We learn from the ancients that light has a greater illuminating value when admitted through a horizontal aperture in the ceiling, and no greater proof of this can be found than in the Pantheon at Rome. The diameter of the eye of this dome is only 27 ft., and yet one must admit that this building is comfortably and sufficiently lighted, though each superficial foot of lighting area has to suffice for nearly 3,400 cubic feet of the contents of this structure. However, it is not often given to the architect to top light many of his buildings, and we will not pursue this subject further. With regard to vertical apertures in walls, it is found that an odd number of windows in an apartment is advantageous, as it obviates a central pier, which latter is apt to give a gloomy effect. In a long and narrow room more effect is obtained by lighting from the ends than from the sides; as if lighted by windows in the longer walls so very many more shadows would be cast. This is well exemplified in the ball-room at Windsor Castle, which is 90 ft. by 34 ft., and is 33 ft. high. It is illuminated by a northern window at one of the narrower sides, occupying nearly the whole width of the wall.

(*b*) *Relative Proportions of Windows.*—The question of climate must necessarily affect our calculations, and the laws laid down by Vitruvius, Palladio, and Scamozzi can scarcely be applicable to climates more distant from the equator, and influenced by local considerations. It being an axiom that smaller and fewer windows are required in a warmer climate. Sir William Chambers recommended adding the depth and height of the rooms on the principal floors together, and taking one-eighth part thereof for the width of the window. Robert Morris recommended that the superficial area of the lighting surface should equal the square root of the cubical contents of the room in feet. Gwilt was of opinion that 1 ft. superficial of light in a vertical wall will in a square room be sufficient for 100 cube feet if placed centrally in such room. This is based on the supposition that the building is free from obstruction by high objects in the neighbourhood. The



*Illustrations to Student's Column.*

model by-laws of the Local Government Board state that the area of the windows in a room should be at least equal to one-tenth of the floor area of such room; and this provision is also incorporated in the London Buildings Act of 1894.

(*c*) *Positions of Windows.*—One of the regulations of the Educational Department is to the effect that school-desks should be lighted from the left-hand side. This is undoubtedly a wise precaution, for if the light be behind the student, the body will cast its shadow upon the work being done. If the light be on the right hand, the work will be in the shadow of that hand. And if the light be directly in front, the reflected light from the surface of the table is directed into the eyes of the worker, and consequently puts an increased strain upon them. Moreover, on raising the eyes, they are subjected to a greater illumination, which stimulates the effort of vision instead of resting the eyes when not at work, as is recommended by oculists.

It is obvious that no fixed rules can be laid down as to the positions of various rooms in relation to the points of the compass, as so much depends upon the various characteristics of the site and local considerations. However, it is well to remember that rooms which are constantly inhabited in the daytime should, wherever possible, have as much actual sunlight as can be obtained through skilful planning.

(*d*) *Glazing.*—Plate glass, though disagreeable in effect, has the practical advantage that it affords less resistance to the admission of light, and being of greater thickness it does not dissipate the heat of the room so quickly as sheet glass. Moreover, it is not so easily penetrated by sounds. Cathedral tinted glass may be used in some situations, and it is claimed that it increases illumination owing to its texture. According to Sir David Brewster, all glass with a roughened or fluted surface increases the amount of light that penetrates any window, but it should always be remembered that such surfaces are prone to harbour dust and dirt.

The following table shows the result of some recent experiments :—

| Nature of Glass. | Percentage of Light Intercepted. |
|---|---|
| Polished British plate ¼-in. thick ...... | 13 |
| 36 oz. sheet glass ...................... | 22 |
| Cast plate ¼-in. thick ................. | 30 |
| Rolled plate, four corrugations to 1 in.. | 53 |

2. ASSISTED NATURAL LIGHTING.

This is found necessary in rooms facing narrow thoroughfares and areas facing adjacent high buildings, and in basements and other places where the solar rays have but limited access. The covering of the obstructive walls with white glazed tiles or facing the same with white glazed bricks, does something to assist the reflection of light into such rooms. And the painting of the walls of the rooms in light colours, or even lining them with white tiles is found to be beneficial. It is also found that by keeping the window frame flush with the external face of the wall, more light is admitted into the room.

*External Reflectors* are sometimes placed outside windows for the purpose of reflecting light into the building. In America and Canada within the last few years the high buildings which have been erected have necessitated the adoption of some means of refracting the light to the lower windows, so as to carry the illumination to the back of the rooms. This has been effected to a larger extent by *Luxfer prisms* which have now been introduced to this country. They are designed upon the following principles :—

The direct natural light to an apartment coming from the sky is, to a large extent, absorbed by the floor, as shown in fig. 258 although even ordinary glass has some refractive influence upon light and thus bends some light into the room. This law of refraction has been utilised in the *Luxfer prisms*, and the latter are so constructed and arranged to suit the varied cases that may arise. Fig. 259 illustrates this principle. In upper floors these prisms are usually fixed in the upper half of the windows and nearly flush with the outer surface of the wall as shown in figs. 260 and 261. In the cases of very lofty buildings the lower windows have canopies as shown in figs. 262 and 263, so as to receive more light from the sky. Basements are lighted by pavement lenses which throw the light down on to a canopy fixed vertically which, in its turns, refracts the light in a horizontal direction to the rear of the apartment as shown in fig. 264. Where the pavement light is narrow and a high stall board is permissible, a sub-canopy may be used as shown in fig. 265.

3. ARTIFICIAL LIGHTING.

This is caused by the heating of some substance till it becomes incandescent. Until electricity had been used in recent years for lighting this condition was solely obtained by using the heat developed during chemical change, but since the impeding of the conduction of an electric current was found to produce incandescence, this method of illumination has steadily increased. Owing, however, to the great gas monopolies and the conservative tendencies of the inhabitants of Great Britain, the progress has been much slower than in other countries. On the American continent electricity plays a far more important part in public and private enterprise.

We may consider this subject of artificial lighting under the following headings :—

(*a*) *Candles and Lamps.*
(*b*) *Gas.*
(*c*) *The Electric Light.*

(*a*) *Candles and Lamps.*—For private dwellings there can be no question that illumination from candles and lamps is popular with certain people. Light for light, however, they are less healthy than gas; there is also more danger of a conflagration ensuing through their use unless great care is exercised. The low-flash oils, which are permitted to be sold to the poorer classes, so often occasion fires and loss of life, that some measures must surely soon be taken to modify this evil. The cheaper forms of lamps also are so dangerous that the wonder is that more accidents do not occur. It is estimated that two sperm candles or one good lamp render the air about as impure as one individual.

(*b*) *Gas*, as distilled from coal, was used by Mr. Murdoch, of Redruth, to light his own house at the end of the eighteenth century; but it was so impure as to render flues necessary to carry away the noxious odours. The lime process of purification, however, alleviated this nuisance, and allowed the use of naked flames. One gas burner will consume as much oxygen and give out as much carbonic acid as six men.

*Illumination.*—The standard method of measuring the power of illumination by gas is a spermaceti candle, burning 120 grains per hour; the consumption of the gas being reduced to 5 cubic feet per hour. The gas in the metropolis should, by statute, be of the illuminating power of sixteen candles. The specific gravity of gas (assuming air as the unit) is, for ordinary calculations, assumed as 45.

The following table is published by Messrs. Stott as their idea of the light required for various purposes.

| | Candle-power per 1,000 sq. ft. of area. |
|---|---|
| Country roads.................. | ½ |
| Small towns .................. | 4 |
| Large towns .................. | 10 |
| Hospital wards .............. | 50 to 100 |
| Barracks and drill-sheds ... | |
| Cottage parlours ............ | 150 |
| Villa dining-rooms ......... | 250 |
| Board schools.................. | 300 |
| Churches and chapels ...... | 300 |
| Banqueting halls, &c. ...... | 450 |

The above approximate calculations must, of course, be subject to the reflecting powers of the decorations and colours used in the various apartments.

*Impurities* in gas are limited more or less by the Act of 1868; the following are the usual tests. For ammonia redden yellow litmus paper with dilute acid and place it in a gas-jet; the presence of ammonia will turn it brown or restore more or less completely the original blue. Under the above Act not more than 2½ grains of ammonia are allowed to 100 cubic feet. For carbonic acid pass a jet of gas through a solution of lime and water which has been allowed to settle; the acid will cause a white discolouration. No sulphuretted hydrogen is allowed under the Act. The test is to prepare a piece of paper with acetate of lead and to put it into a jet; sulphuretted hydrogen will turn it brown.

*Pipes* of wrought iron, with screwed joints should be used. Lead and composite pipes, are to be avoided, owing to their liability to injury, and to the fact that nails are often found to have pierced them during the finishing of a building.

Messrs. Stott publish the following formula to ascertain the sizes of pipes required, the specific gravity of London gas being assumed to be constant, and the pressure being taken at $1\frac{7}{10}$ in.:—

$$N = \frac{200\,D^2 \times \sqrt[4]{D}}{\sqrt{2 \times L}}$$

Where N = the number of lights, each consuming 6 cubic feet per hour.

D = the internal diameter of the pipe in inches.

L = the length of pipe in yards.

Molesworth gives the following table of the inside diameter in inches of service pipes:—

| No. of lights burning 5 c. ft. per hour. | Distance from main in feet. | | | | | | |
|---|---|---|---|---|---|---|---|
| | 25 | 50 | 75 | 100 | 150 | 200 | 300 |
| 5 | ⅜ | ⅜ | ⅜ | ⅜ | ½ | ½ | ½ |
| 10 | ⅜ | ½ | ½ | ½ | ⅝ | ⅝ | ⅝ |
| 25 | — | ⅝ | ¾ | ¾ | ¾ | ⅞ | ⅞ |
| 50 | — | — | ⅞ | 1 | 1 | 1⅛ | 1¼ |
| 100 | — | — | 1⅛ | 1¼ | 1⅜ | 1⅜ | 1½ |

It is convenient to have a small draw off pipe at the lowest point of the service, so that the water absorbed by the gas in the reservoir (where it is stored over water) and deposited in the pipes may be drawn off. Gas readily absorbs water and deposits the same when at a lower temperature, and where water meters are used the deposit of this water in the pipes is a great nuisance, as it produces a flicker in the lighted gas which renders it impossible for convenient use.

◆

## OBITUARY.

Mr. W. L. Henderson.—The death has occurred at Bridge of Allan of Mr. William Low Henderson, head of the firm of Messrs. W. Henderson & Son, architects and valuators, Aberdeen. Mr. Henderson, who was seventy years of age, was a graduate of Marischal College, and had been in business for many years.

◆

Church, Yarmouth.—On the 31st ult. the opening and dedicatory services took place in respect to St. Luke's Church, Cobholm, erected on a plot of ground adjoining the Church Mission Room. St. Luke's Church stands on a corner site in the principal thoroughfare at Cobholm, and has been built from plans prepared by Mr. Sidney Rivett, architect, South Quay. The following were the various contractors, viz.:—Mr. A. E. Bond, brickwork and masonry; Mr. A. J. Willimont, carpentry, &c.; Mr. W. T. Spencer, plumbing and painting; coloured glazing, Mr. W. R. Weyer, of Norwich.

## GENERAL BUILDING NEWS.

The Restoration of Malmesbury Abbey.—At a meeting of the Malmesbury Abbey Restoration Committee, held in the Town Hall, Chippenham, on the 24th ult., Mr. Harold Brakspear, the architect, produced and explained the plans of the work to put the parish church in a state of repair, the cost of which, at a previous meeting, was estimated at about 10,000*l*. On the motion of the Rev. G. Windsor Tucker, seconded by Sir R. H. Pollen, the plans and specifications were unanimously adopted. Lord E. Fitzmaurice proposed that a limited number of builders be invited to compete. This was seconded by the Archdeacon of Bristol, and carried. Certain names were suggested, and it was generally agreed that the chairman should take advice as to one or two further names, and that invitations should be sent out accordingly.

Llangathen Church, Carmarthenshire.—It has been resolved to carry out certain works of restoration to this church, which dates from the fifteenth century. The present chancel arch, chancel roof, east window, and the arcade between the chancel and the Aberglasney Chapel, which evidently suffered in Puritan times (both Cromwellian and Victorian), and which have now lost all Gothic semblance, will be replaced with something more appropriate. The Cadvan Chapel, on the north side of the nave, will also be dealt with. At present the internal walls of the church are plastered (probably "Puritan"), and it will be interesting to know what work the plaster may conceal, as a small piscina, with a four-centred head, a Gothic recessed tomb (apparently) both at the east end of the south aisle, and an imposing Renaissance tomb to a Bishop in the Aberglasney Chapel, seem to show that the church was one of considerable importance. The architect—Mr. R. Wellings Thomas, of Llandrindod Wells—has decided to use the same quarry stone in the new work as the ancient dressings are executed in, viz., a red coarse sandstone from Llandebie. Stained glass has already been promised for the new east window.

Hexham Abbey Restoration.—We understand that the joint report of Mr. C. C. Hodges, as architect, and Mr. Temple Moore, as consulting architect, on the above has been adopted by the committee, and the work is to go on. The scheme is a large and important one, and comprises the building of the nave and putting back in their old places, as far as possible, all the old furniture of the choir and the detached chantries, and, to a large extent, undoing the mischief that was perpetrated in 1858-60.

Seamen's Church and Institute, Yarmouth.—The foundation stone was laid recently on the South Quay of the new church and institute to be there erected for the use of seamen and fishermen. The present buildings will be completely cleared away, and the site will be about 90 ft. by 28 ft. On the ground floor there will be a Seamen's Institute 68 ft. by 28 ft. and 12 ft. 6 in. high, with a store-room 16 ft. by 13 ft. On the first floor will be a mission church 68 ft. by 28 ft., and 22 ft. to the apex of the roof, the vestry being 16 ft. by 13 ft. The main entrance to the Institute will be from the Quay, with outer and inner swing doors. The floor will be of pitch-pine wood blocks laid on concrete, the walls having a wood dado. The church will have a broad staircase of pitch-pine leading from an entrance lobby in Row 143. There will also be an iron staircase from the vestry leading down into the open space left to the east. The ground floor walling will be of red brick, and the upper floor will be of half timber filled in with brick nogging. The architects are Messrs. Bottle & Olley. The builder whose tender has been accepted is Mr. W. Cork, and the plumber is Mr. R. A. Eastoe.

Chancel, Parish Church, Aghalee, Belfast.—On the 27th ult. the new chancel of this church was consecrated. The architect was Mr. J. H. Fullerton, of Belfast, and the contractor was Mr. Forsythe.

U. P. Church, Gardentown, Aberdeen.—A new church for the Gardentown U. P. congregation has just been opened. Mr. R. G. Wilson, Aberdeen, was the architect.

New Mission Halls, Westbourne Free Church, Glasgow.—The memorial-stone of the mission-halls in Ruchill-street, Maryhill, was laid recently. It is intended that comparatively soon a church to accommodate about 800 persons shall be erected on the same site, and that the mission premises shall be handed over to the new church. The halls will occupy a frontage to Ruchill-street of 42 ft., and provide on the ground floor a hall measuring 47 ft. by 40 ft., with a lesser hall 16 ft. 6 in. by 22 ft., and a small room 8 ft. by 13 ft. 6 in. On the upper floor there will be a hall 16 ft. 6 in. by 45 ft., divided with a folding partition, a library, and a sewing-room. At the back of the premises a house of three rooms and kitchen will be provided for the beadle. The architects are Messrs. John Honeyman & Keppie.

Church and Schools, Northampton.—On the 1st inst. was dedicated the temporary iron building which has been erected in Edinburgh-road, Queen's Park, and which is eventually to be replaced by Holy Trinity Church. The church comprises a nave and chancel. The elementary school provides, in the mixed school, for 120 places and in the infants' room eighty places. There are also boys' cloak-rooms, girls and infants' cloak-rooms, and outdoor offices. The church and schools have been erected by Mr. H. Green, from plans prepared by Mr. M. H. Holding. The plumbing, glazing, gas fitting, &c., was done by Mr. H. M. Goy, of Northampton.

Wesleyan Church, West Stanley, Durham.—The new Wesleyan Church and Sunday Schools at West Stanley, which have been erected at a cost of over 4,800*l*., were opened on the 31st. ult. The church has been designed by Messrs. Green & Brockbank, architects, Liverpool, the building contractor being Mr. Alfred Routledge, West Stanley, while Mr. Thomas Mordue, Dipton, executed the joinery work. The church seats 1,000 persons, and schoolrooms, vestries, &c., are arranged underneath.

Church of St. Simon, Paddington.—On the 30th ult. the Bishop of London consecrated the new church of St. Simon, Saltram-crescent, Paddington, a district formed out of the parishes of St. Jude's, Kensal Green, and St. John's, Kilburn. The new church, of which the chancel yet remains to be erected, is a building of red brick with Bath stone dressings, and has been constructed by Messrs. Bentley & Sons, from the plans of Mr. J. S. Alder. The cost so far incurred has been 4,500*l*.

Church Renovation, Kingston-on-Thames.—The Eden-street Congregational church was re-opened on the 28th ult., after renovation. The ceiling and walls have been decorated, the whole of the woodwork has been stained and varnished, and choir stalls, with fifty seats, have been provided on the right hand side of the pulpit. The church is now lighted throughout by electricity. The work has been carried out by Mr. Whitmarsh (G. F. Havell, Eden-street), under the superintendence of Messrs. Carter & Ashworth, architects. Messrs. Prestwich & Burt carried out the electric lighting installation. The cost has been about 700*l*.

Church Restoration, East Stockwith, Lincolnshire.—The church of St. Peter's, East Stockwith, has just been reopened after renovation. With a view to celebrating the jubilee of the church in 1896 the churchwardens instructed Mr. H. G. Gamble, architect, of Lincoln, to prepare plans for the erection of two new vestries, and for the general renovation of the interior of the building. The work has been executed by Mr. Moody, of West Stockwith, and Mr. C. Slingsby, of East Stockwith.

Catholic Schools, Stockton.—Plans have been prepared by Mr. Arthur Harrison, architect, Stockton, and approved of by the Education Department for new Catholic infants' school. The school will provide seating accommodation for 320 scholars. The contract has been let to Messrs. Johnson & Hanby, contractors, Stockton, the total cost of the schools being estimated at 3,000*l*.

Additions to King Edward's Grammar School, Stourbridge.—Additions to this school have just been carried out by Mr. W. North from plans prepared by Mr. T. Grazebrook. The new buildings include a porch and corridor, a physical laboratory, a lecture room, a chemical laboratory, and an additional class-room; and the total outlay amounts to some 2,000*l*.

Police-court, Pocklington.—A new police-court, in George-street, was opened on the 3rd inst. The building contains court-room, witnesses' retiring-room, retiring-room for the magistrates, charge-room, &c. Three cells are on the south side of the court. The principal elevation is executed with moulded red bricks and Howley Park stone. The building was designed by Mr. Alfred Beaumont, and the builder was Mr. T. S. Ullathorne, of Selby.

Masonic Hall for Lurgan, near Belfast.—At a meeting of the members of the three Lurgan Masonic lodges recently, it was agreed that the recommendation of the Building Committee to appoint Mr. Thomas M'Millen, Belfast, contractor for the erection of the new Masonic Hall on the site recently secured from the Lurgan Real Property Company in Windsor-avenue be adopted. The contract price is 1,286*l*. odd. The edifice has been designed by Mr. Godfrey W. Ferguson, Belfast.

Hotel, Nottingham.—A new hotel, "The Portland," has just been erected on Carrington-street Bridge. It contains sixty bedrooms, coffee, commercial, and private sitting rooms. The architects were Messrs. Evans & Son.

Cricket Pavilion, Reading.—Prince Christian recently unveiled the Murdoch Cricket memorial tablet, erected in the new cricket pavilion in the County Ground. The Berks County C.C. pavilion has been erected from the designs of Mr. G. W. Webb, architect, of Reading. It is in the old English, half-timbered style, and the building is surmounted by a bell-turret, while in the central gable is a large clock. The principal apartment of the building is the central luncheon room, which measures 40 ft. by 20 ft., and has a refreshment bar, cellar, and all other necessary accommodation. On the left of the main entrance is the members' dressing-room, measuring 25 ft. by 15 ft., with adjoining separate bath-room, lavatory, and other offices; while on the right of the luncheon room a committee room, about 15 ft. square; a visitors' room, about 18 ft. by 15 ft., also with separate bath-room, lavatory, and offices, and also a room and offices for the professionals have been constructed. Attached to the building on this side is a covered stand with terrace, which is reserved for the use of the professionals The floor of the pavilion is throughout raised some 5 ft. from the level of the ground, and the terrace enclosure extends about 20 ft. in front of the building. On the first floor the principal feature is the balcony running along the front and measuring 45 ft. by 7 ft., which is reserved for the use of members and their friends; this is approached by outside staircases. There is also a scorers' room, with a balcony, and a workshop and store-room, 30 ft. by 14 ft., for the use of the ground men, each approached by a separate outside staircase. Messrs. Lewis Bros. were the contractors for the building of the pavilion.

Newcastle Natural History Museum.—The Hancock Museum, Barras Bridge, has just undergone renovation. The work consisted of repairing the stonework, renewing the glass roof, improving the drainage, and several smaller items. Mr. F. W. Rich was the architect.

Proposed New Theatre, Llandudno.—The Llandudno Grand Theatre has been designed by Mr. G. A. Humphreys, in consultation with Mr. E. O. Sachs. It is to front the proposed extension of Mostyn-street. The total cost of the building, including furnishing, fittings, and decoration, is estimated at 14,000*l.*, and the site is to cost 3,000*l.*

New Infirmary at Ecclesall Workhouse, Yorkshire.—The foundation-stone has just been laid of a male infirmary which is to be erected in connexion with the Ecclesall Workhouse, at a cost of 25,000*l.* The new infirmary will consist of two blocks, both for males, and an administrative section. Mr. J. D. Webster, of Sheffield, is the architect.

Bank Premises, Glasgow.—The new buildings for the National Bank are to be erected at the south-western corner of Buchanan-street and St. Vincent-street, Glasgow. In each street the length of frontage is practically the same—about 100 ft. The architect is Mr. J. M. Dick Peddie, Edinburgh.

Moyses' Hall Museum, Bury St. Edmunds.—On the 31st ult., Moyses' Hall, formerly used as a police-station, was opened as a museum of antiquities and curiosities. Recently, under the supervision of Mr. J. Campbell Smith, the Borough Surveyor, the building has been restored for its present purpose, care having been exercised that none of its ancient historic features should be destroyed. During the progress of the restoration work an archway was discovered, connecting the outer with the inner room. The archway, erected with fragments of Norman material, apparently taken from the outer wall at the period when it was rebuilt, seems to belong to a later period than the structure itself.

Railway Station, Droitwich.—The Great Western Railway Company has just opened a new railway station at Droitwich. The station was designed by the company's engineers, Mr. W. D. Robotham & Mr. W. K. Woodward. The contractor was Mr. A. Bloxham, of Banbury.

Batley Town Hall.—Plans for the proposed new town hall, Batley, have been prepared by Messrs. W. Hanstock & Son, architects, of Leeds and Batley. The intended position of the new building is on the Market Hall estate, and the present Market Hall will be removed to permit the erection of the new structure. The estimated cost is 30,000*l.* exclusive of the site, which is the property of the Corporation.

Manor Asylum, Horton, Epsom.—This building has just been opened by Mr. N. N. Hubbard, Chairman of the Asylums Committee of the London County Council. Originally the scheme provided for the accommodation of 700 female patients. There were to be four blocks for chronic cases, with 440 beds; three for the infirm, with 176 beds; and two for convalescents, with eighty-four beds. The Council, however, subsequently sanctioned the conversion of one of the blocks for the reception of 110 male patients. Sixty beds are in single rooms. Each block is complete in itself, and has besides the necessary sanitary provision and bath, a ward scullery, clothes, boot, and food stores, and three nurses' rooms. There are two general bath-rooms and a needle-room built off the main corridors, in addition to the accommodation provided in the wards for the purpose. The recreation hall, with stage, is designed to seat 400 people. The visiting-room is arranged in a central position, and a special set of rooms have been provided in connexion with the block nearest the entrance for the reception, bathing, and examination of new cases. A mess-room is provided for the non-resident officers in a position adjacent to their offices. The resident staff, other than those provided for in the wards, will be housed in the mansion-house and its out-buildings. A lodge has been designed for each entrance to the estate. Offices for the chaplain, clerk, steward, and dispenser, and a laboratory and mortuary are provided. The buildings were designed and their erection supervised by the Asylums Committee's Engineer, Mr. W. C. Clifford Smith. The principal contractors were Messrs. Leslie & Co. (temporary buildings), Messrs. Kirk & Randall (alterations to Manor House, &c.), Messrs. Isler & Co. (bore-hole for water and pumping plant), and Messrs. W. Summerscales & Son (laundry machinery). Messrs. J. & F. May supplied the kitchen and scullery plant.

Factory Premises, Nottingham.—A block of buildings has just been erected on a site on the Colwick-road, Nottingham. The buildings, in which will be carried on the trade of furniture-making, comprise a saw-mill, the main block of workshops, boiler-house, engine-house, a generating station, which supplies the electricity for lighting the buildings and running the whole of the machinery, and the repairing-shop. The architect was Mr. W. B. Starr, of Nottingham.

Bank Premises, Dublin.—The business of the present branch of the Hibernian Bank in Dorset-street will shortly be transferred to the new building erected for them at the junction of Dorset-street and St. Joseph's-avenue, formerly known as White's-lane. The architect was Mr. W. H. Byrne, and the builder Mr. Kevin Toole.

Public Baths and Working-class Dwellings, Stratford.—At the Stratford Town Hall recently, Mr. H. H. Law, M.Inst.C.E., held an inquiry on behalf of the Local Government Board into the application of the West Ham Council, for sanction to borrow certain moneys for the erection of public baths at Stratford, and 5,950*l.* for the purchase of land as a site for dwellings for persons of the working class. Mr. Hilleary, Deputy Town Clerk, said the houses which the Council intended to erect would be double tenements, and would be let at 6s. 6d. per week for the half house. The land was situate at Plaistow, within a short distance of a block of 150 houses. Mr. Maurice Russell said the site comprised 16,400 superficial yards, exclusive of roads, with 1,904 ft. frontage, and a depth of nearly 80 ft. The question of the baths, lock-up, and shops was then considered, it being pointed out that sanction was asked to borrow 39,135*l.* Mr. A. Saxon Snell submitted the plans, and explained the arrangement of the building. The building would be erected of red bricks with facings of Portland stone. The bath floors would be of concrete, and the building fireproof throughout.

Cottage Hospital, Blairgowrie, Perthshire.—It is proposed to erect a cottage hospital at Blairgowrie. The building will be of Blairgowrie Quarry material, with Bannockburn stone facings. The accommodation will consist of two wards of three beds each. A special ward will also be provided for cases that may require to be isolated. The building will also include an operating-room, bath-room, &c. Mr. Lake Falconer, of Blairgowrie, is the honorary architect.

Infectious Diseases Hospital, Burnley.—A Local Government Board inquiry was held at Burnley recently by Mr. W. W. E. Fletcher into an application by the Burnley Joint Hospital Board for sanction to borrow 6,000*l.* for the erection of an infectious diseases hospital. Mr. F. S. Button is the architect.

Reformatory, Loanhead, Edinburgh.—A new reformatory was opened at Loanhead on the 3rd inst. The architect was Mr. T. T. Paterson, of Edinburgh.

New Grammar School for Dudley.—The newly-erected grammar school in St. James's-road, Dudley, was opened on the 7th inst. The school is situated in St. James's-road, near the church of that name. The front elevation consists of three large gables, flanked at the western end by a smaller gable set back, and at the eastern end by a small battlemented window and a small tower. In the centre of the roof is a bell-tower. The school and house have been erected from the plans, selected in a competition, of Messrs. Woodhouse & Willoughby, of Manchester, and the building contract has been carried out by Messrs. Webb & Round, of Dudley; the clerk of the works being Mr. George Hancox, of Pensnett. The rear of the building is lower than the front, and there are entrance porches at the eastern and western ends. The basement contains heating chamber, kitchen, and mess-room on the same level as the playground, which is partly covered and will be paved with Davies's patent limestone asphalte. On the ground floor are the porches, entrance hall, master's room, central hall, five class-rooms, lavatory, and cloak-room. There is a teachers' room on the second floor. The central hall is 56 ft. by 28 ft. The dimensions of the class-rooms are 18 ft. 9 in. by 20 ft., and this floor is paved in American birch, laid by Mr. Roger Lowe, of Farnworth, Bolton. The wing extending to the rear consists of the chemical laboratory, preparation room, and lecture theatre. The whole of the premises have been built with Edwards' (Ruabon) red brick and terra-cotta, and are roofed with tiles supplied by Mr. G. Hall, Birmingham.

Extension of the British Art Gallery.—The additions that have been made to the British Art Gallery at Millbank are now nearly complete. The new galleries consist of ten rooms, of which two are to be devoted to sculpture. The additional space provided will necessitate a rearrangement of the pictures. The architect for the gallery was Mr. Sidney Smith.

Drill Hall, Landport, Portsmouth.—The new drill hall for the 3rd (Duke of Connaught's Own) V.B. Hampshire Regiment (rendered necessary by the Admiralty taking over the present building for the Naval Barracks) will have a frontage to Stanhope-road. The material will be dark red brick, with Portland stone dressings. The building will consist of a large drill space, round which are grouped the various offices. The drill hall proper occupies the ground floor, its dimensions being 144 ft. by 120 ft.; there will be two galleries. To the right of the main entrance, and leading from the large hall, will be a smaller hall, to be known as the gymnasium and recruits' hall. The dimensions of the second hall are 60 ft. by 46 ft., and dressing-rooms are attached. Over this portion of the building is the officers' mess-room and ante-room. On the ground-floor to the left of the main entrance there are Commanding Officer's room, orderly-room, armoury, men's recreation-room, junior N.C.O.s' room, band-room, and stores. On the first floor over the band-room is the committee-room; and the sergeants' mess occupies a space of about 60 ft. by 26 ft. over the N.C.O.s' room and part of the men's recreation-room. Adjoining the sergeants' mess is a room which will be set apart for the use of the Hampshire Yeomanry and stores for the quartermaster. The building will be mainly of two stories, a third story and a portion of the block being the caretaker's apartments. The plans for the new building have been prepared by Major A. H Bone.

New Halls for Springburn, Glasgow.—The new halls which the Glasgow Corporation have resolved to erect for the Springburn district will occupy a prominent site at the corner of Millerbank-street and Keppochhill-road. Included in the design are two halls placed together longitudinally, and so arranged that while the entrances, exits, and retiring-rooms for each are quite separate and distinct, they may be let together *en suite* when occasion requires. The main hall measures 77 ft. by 50 ft., exclusive of crush-hall and orchestra, and provides seating accommodation for 1,209 persons. The principal entrances are from Millerbank-street, and these open into a crush-room, from which any part of the hall may be reached. In the dividing wall between the two halls are two sets of double doors, which will be opened when the halls are used *en suite.* The platform entrance is from Keppochhill-road, and communicates by means of a corridor under the platform with the retiring-rooms which overlook the lane. On the ground floor is a committee-room, while immediately above are situated the dressing-rooms for the artistes. There is a cloak-room in connexion with the ladies' and gentlemen's retiring-rooms in the basement. In the basement under the main hall a large store for forms, &c., is provided, together with three committee-rooms, which are placed so that they are lighted and ventilated to an area to Keppochhill-road. It is proposed that these rooms should be divided by movable partitions. The lesser hall measures 32 ft by 27 ft., and provides seating accommodation for 408 persons. The principal entrance is from Millerbank-street, and from the entrance-hall a staircase leads upward to the gallery and downward to basement. There are emergency exits at each side of platform. The kitchen is placed in the basement under the lesser hall, and a lift for the convenience of purveyors is provided from the kitchen corridor to the service lobby at the south side of platform. The materials for the exterior will be red freestone and green Westmoreland slates for roofs. The total cost of the building is estimated at 11,404*l.* Mr. W. B. Whitie is the architect.

◆

## *SANITARY AND ENGINEERING NEWS.*

Bridge over the Spey at Boat of Garten, Inverness-shire.—A bridge is being erected over the Spey at Boat of Garten, and on the 27th ult. the foundation stone was laid. The bridge, which is of some 350 ft. span, is of timber with stone piers and abutments, and was designed by Mr. A. Mackenzie. The contractor is Mr. Charles Mackay, Inverness, the sub-contractor for the mason work being Mr. A. Macpherson, of Newtonmore.

Sewerage Works, &c., Manchester. — On the 2nd inst. Mr. E. A. Sandford Fawcett held a Local Government Board inquiry, at the Manchester Town Hall, into the application of the Corporation for leave to borrow 30,000*l.* for works of sewerage in connexion with the Moston Brook culvert, and 3,000*l.* for the equipment of the Harrison-street lodging-house. Mr. Hudson, Deputy Town Clerk, said it was intended to spend the 30,000*l.* on the repair of the Moston Brook culvert, which carried the Moston Brook from Green Mount to the River Irk. In August, 1898, the culvert collapsed at Hall's-crescent, Collyhurst, causing serious damage. An inspection of the sewer had been made, and Mr. Wilkinson, C.E., had presented a report to the Corporation in which he recommended the execution of strengthening works in the existing culvert, and the construction of a supplementary culvert at a point near Queen's-road, discharging into the River Irk near Smedley Bridge. The Corporation had adopted this scheme, and the new culvert would be circular, 10 ft. in diameter.—Mr. T. de Courcy Meade, the City Surveyor, gave evidence with reference to the detail working of the scheme. As to the application with regard to the Harrison-street lodging-house, Mr. Hudson said that the construction of a lodging-house had been already sanctioned by the Local Government Board. At a former inquiry estimates were put in for the buildings only, amounting to 21,701*l.*, and no provision was made for the equipment of the house, which was to accommodate 363 men.

The New Beachy Head Lighthouse.—The lighthouse situated at Belletoute, the second cliff westward of Beachy Head—a structure so familiar to visitors to Eastbourne and its vicinity—will soon be a thing of the past. To the existing light, good and serviceable as it has proved in most respects, there has always been one objection. Situated, as it is, at an altitude of 285 ft. above high water, spring tides, it is frequently capped with fog, and at such times it is more or less invisible. It has, therefore, been deemed advisable by the responsible authorities not to place the new lighthouse on the headland at all, but on the foreshore beneath (viz., about one and a quarter mile eastward the old one), where far less fog prevails than higher up, and whence its light will be visible from Dungeness on the eastward around through south to the western limit of the present light. This scheme involves the construction of a massive granite tower, the foundations of which will be laid at a level of 9½ ft. under low water, and temporary dams will have to be formed to admit of the setting of the lowest portions of the work. The tower, which will be rather over 47 ft. in diameter at its base, is to be solid for 47 ft. 6 in. upwards, with the exception of the space required for the storage of water, and its height to the top of the masonry will be 123 ft. 6 in. Above the solid portion will come the rooms, eight in number (the four uppermost ones being 14 ft. in diameter), and finally the lantern, in which will be installed a Dioptric (lenticular) illuminating apparatus of the most modern and approved type, giving two white flashes in quick succession every fifteen seconds. It is expected that the new lighthouse, which is from the designs of Mr. T. Matthews, the engineer-in-chief to the Trinity House, will be completed within three years from this date.—*Daily News.*

Sewage Works, Oswestry.—An inquiry was held on behalf of the Local Government Board by Mr. W. A. Ducat, at Oswestry, on the 2nd inst., into an application by the Town Council for sanction to a loan of 3,500*l.* to meet the cost of proposed new sewage works. In 1896-7 Mr. R. C. Wynne Roberts, the then Borough Surveyor, began a series of experiments as to dealing with the sewage by its purification on bacteriological principles. Mr. G. W. Lacey said the works being constructed consisted of two series of filter beds, nine in each series.

Sewage Disposal, Gildersome, Yorkshire.—At the Urban District Council Offices, Gildersome, on the 1st inst., Colonel J. T. Marsh, R.E., Local Government Board inspector, held an inquiry respecting the application of the Gildersome Urban District Council for permission to borrow 12,500*l.* for purposes of sewerage and sewage disposal. The technical features of the proposed scheme were explained by Mr. John Waugh (engineer) and Mr. G. B. Waugh.

## *STAINED GLASS AND DECORATION.*

Memorial Windows, Consett Parish Church —Two stained-glass windows have been placed in the chancel of this church, in memory of the late vicar. The windows were designed and executed by Mr. A. O. Hemming, of London.

Memorial Window, Ledbury Church, Herefordshire.—A stained glass window, the work of Mr. C. E. Kempe, has just been erected in Ledbury Church in memory of the late Mr. C. E. Maddison.

St. Andrew's Church, Eccles, Manchester. —An oak reredos, consisting of shafts, pinnacles and arcading, has just been dedicated in this church. The whole forms a frame to a sculptured panel in high relief, designed and modelled by Mr. Percy Bacon, subject "The Lord's Supper." The reredos was designed by Mr. Frank P. Oakley, and executed by Messrs. Percy Bacon & Bros. of London, under the supervision of the architect.

## *FOREIGN.*

France.—A special inquiry is to be set on foot shortly to ascertain if there are still any dwelling-houses in Paris in so insanitary a condition as to constitute a public danger, and also to inquire into the general condition of working-class dwellings in the city.——M. Aimé Morot has resigned his position as professor of painting at the Ecole des Beaux-Arts. It is probable that M. François Flameng will succeed him.——M. Loviot, the eminent architect, has been commissioned to prepare the plans for the temporary building for next year's Salon. It will be on a site comprised between Avenue Saxe, Avenue Breteuil, Rue Barthélemy, Rue Bellard, and Rue Perignon. The principal entrance will be in the Place de Breteuil. The plan will comprise a semi-circular central garden with galleries giving access to the picture saloons.——The Académie des Beaux-Arts has been occupied with the election of two new members in place of the late M. Duplessis and the late Marquis de Chennevières. In the room of the former it has elected M. Guiffrey, Director of the Gobelins, and author of a history of tapestry and of various critical works on art. The place of the Marquis de Chennevières is taken by M. Rougon, also a well-known writer on art.——The Ministère des Affaires Etrangères has been officially informed that next year the United States Government intend to establish a "Prix de Paris," corresponding with the Prix de Rome in France, and with similar objects.——New post and telegraph offices have been built at Pau and Montélimar.——The "Société des Architectes des Bouches de Rhône" has organised four competitions in decorative design :—the first for craftsmen ; the second for pupils of the Ecole des Beaux-Arts; the third for those of the Ecoles Professionelles ; and the fourth for work done by women.——The new Town Hall at Argenteuil was opened last Sunday. The architects are MM. Maistrasse and Berger and M. L. Batton.——The death is announced, at the age of sixty, of M. Pierre Outin, the painter. He was a pupil of Cabanel and Lecomte, and exhibited portraits and *genre* pictures almost every year at the Salons. Among his works we may mention especially "Le Mort du Gentilhomme" (Salon of 1868), "L'Amateur" (1872), "Manon Lescaut" (1877), "Quentin Durward" (1878), and "Courses d'Automme" (1880). He exhibited a portrait in the Salon of this year.

Sanitation of Bombay.—We understand that the Bombay Municipality have retained the services of Mr. Santo Crimp, M.Inst.C.E., of Westminster, to advise them on the sanitation of the city. Mr. Crimp will proceed to Bombay in September next, and will probably remain there about two months. One of the most important points which Mr. Crimp will have to consider will be the question of lowering the level of the subsoil water under the city, an exceedingly difficult operation, having regard to all the circumstances. That the drying of the subsoil in such a climate as that of Bombay is of the greatest importance, from a sanitary point of view, cannot be questioned, and it is to be hoped that Mr. Crimp will be able to devise some method by which this can be accomplished, and thus help to lessen the unhealthy condition of the city.

## *MISCELLANEOUS.*

The York-Street Insanitary Area, Leeds.—An inquiry was held at the Leeds Town Hall on the 30th ult., by Colonel J. T. Marsh, R.E., Local Government Board Inspector, with reference to the Provisional Order, confirmed by the Act of 1896, in regard to the housing of working classes displaced under the York-street insanitary area scheme. What the Corporation ask is the exclusion from the scheme of a lodging house in Harper-street, and of certain land adjoining the North-Eastern Railway, and the sanction of the Board to the disposal of certain land comprised in the scheme for purposes other than the erection of dwellings for the accommodation of persons of the working class.

The Holborn to the Strand Improvement Scheme.—The London County Council Improvements Committee propose to acquire for 200,000*l.*, for the housing of 2,070 persons of the labouring class, about to be evicted from the Clare Market and Drury-lane district, the site, in part, of Reid's Brewery, Clerkenwell-road (formerly Meux's in Liquorpond-street). Further negotiations are in progress for the purchase of all the site between Hatton Garden and Gray's Inn-road, which will provide room for buildings to accommodate nearly 1,000 more.

The Lakes of Killarney.—The Killarney district is owned by the Earl of Kenmare and Mr. Herbert, of Muckross. The latter proprietor, having lately disposed of his agricultural land to the tenants, is now about to sell the mansion-house and demesne which have belonged to his family during a long period. The property, within which lies the middle lake, comprises deer forests, game and fish preserves, lakes and islands, extending over 13,000 acres ; the sale will include Muckross Abbey, the Devil's Punchbowl, Torc Mountain, and Waterfall, O'Sullivan's Cascade, Old Weir Bridge, the Meeting of the Waters, and many other famed features of the locality. It has been suggested that the property, for which a tentative offer of 30,000*l.* has been refused, should be purchased by the State for dedication to the public ; the levying of tolls during some years past seems to preclude the establishment of public rights of way.

St. Dunstan's, Fleet-street.—Dr. Tristram, Q.C., Chancellor of the Diocese, has agreed, provisionally, to grant a faculty for the sale of the site on the west side of the church tower. The proposed enlargement of the Law Life Assurance Society's premises (John Shaw, the younger, architect) will be carried out after the designs of Mr. W. E. Clifton, and the purchase-money, 4,500*l.*, is to be devoted to the erection of a rectory-house on the east side of the tower. The sale is made under an Act, 10 Geo. IV., c. 96, appointing trustees to pull down the old church and erect a new one, with powers of sale over such parts of the old site and any land purchased under that Act as might not be required. The trustees sold the ground now occupied by the Law Life Society and (on the east side) by Sir John Leng, M.P., proprietor of the *Dundee Advertiser.* The present sale will result in covering the two fore-courts on either side of the tower, which rises from the ground, and in blocking up the body of the church as now seen from the street.

Kildrummie Castle, Aberdeenshire.—It is stated that the recent purchaser of this property intends to build for himself a new castle upon the old site. Kildrummie, situated on an eminence sloping to an affluent of the Don, was built by Gilbert de Moray, Bishop of Caithness, during the reign (1214-49) of Alexander II., and ranks as one of the largest of its kind in Scotland. It was formerly owned by David, Earl of Huntingdon, Robert Bruce, and the Earls of Mar. The curtain walls, having a gateway on the south side and towers at the angles, enclose an enceinte hexagonal on plan, within which stand apart the great hall and the chapel. At the north-west angle is the now ruined Snow tower, 53 ft. in diameter, which contained a draw-well. Against the north wall, 200 ft. long, abuts a block having the hall, 73 ft. by 41 ft., on its first floor. Of the chapel, which projects at an angle from the east curtain wall, only the east end remains ; it has three thirteenth-century lancet windows. Edward I. captured the castle in 1306, and made Nigel Bruce prisoner. It is conjectured that to the subsequent occupation by the English is due the square-headed trefoil over a two-light window in the north-east tower. James III. bestowed Kildrummie upon Robert Cochrane, the architect, to whom was granted, it is said, a patent as Earl of Mar, and who was beheaded at Lauder Bridge (1482). The masonry of the castle consists of well coursed and dressed ashlar, of freestone, brought from a distance.

The Electric Lighting of Penzance.—Mr. Frank Latham, C.E., Surveyor for the Borough of Penzance, has prepared an exhaustive scheme for the supply of electricity to the district of Penzance and the construction of a refuse destructor in the Borough. He considers the wisest course for the Corporation to pursue would be to obtain an order which will enable them to supply electricity to, firstly, the Esplanade, Morrab-road, Alexandra-road, Chapel-street, Market Jew-street, and Alverton-road ; and, secondly, the whole Borough. The system of electric lighting which he considers would best answer the requirements of the district is the low tension, continuous current, three-wire system, with accumulators. As to the cost, he estimates the installation would cost 21,365*l.*, and the annual expenditure for working and maintenance 3,468*l.*, making the cost per light 18s. 7d. per annum.

Memorial Tablet, St. Botolph, Bishopsgate. —A tablet to the memory of the late rector of the parish (the Rev. William Rogers) was dedicated recently in this church. Above the panel is a profile portrait in low relief. The monument was designed by Mr. J. F. Bentley, and was executed by Messrs. Farmer & Brindley, of Westminster Bridge-road.

## *CAPITAL AND LABOUR.*

Settlement of the Building Dispute at Sunderland.—The builders' labourers at Sunderland decided on the 1st inst. to return to work at the old rate of 6½d. per hour. They will receive time and a quarter for overtime, and 1d. per hour extra for work in connexion with dirty drains, &c. The employers have agreed to withdraw their notice for a reduction of ½d. per hour. By a re-arrangement of meal hours the labourers will work the same hours as the journeymen whom they serve. There still remain a few points in regard to certain rules which the employers are prepared to discuss after the men return to their work. About 400 labourers originally came out on strike. The dispute started on April 15.

Bricklayers' Strike at St. Helens.—About 200 bricklayers and masons are on strike at St. Helens. Six months' notice, which under the trade rules must be given when an alteration of wages or working hours is desired on either side, was handed in on December 1 by the men. The men want to be paid at the rate of 9½d. an hour instead of 9d. as at present ; secondly, they request that there shall be only one apprentice to every four men, and not more than three employed by one firm, instead of a proportion of one apprentice to three men, and not more than six in a shop, as under present conditions ; thirdly, they ask that the allowance of walking time be placed on a more favourable basis for them. The masons number about twenty, and their demand also is for an extra ½d. per hour, which would bring their wages up to the Liverpool standard.

The Norwich Building Trade.—The points raised as to wages and rules by the various classes of workmen in the Norwich building trade have been amicably settled, after repeated conferences, and ½d. per hour advance will be given to carpenters, bricklayers, masons, builders' labourers, and painters.

Chester Bricklayers' Labourers.—The Chester bricklayers' labourers have discontinued work in consequence of their demand not having been granted by their employers. Six months ago they demanded a rise of their wages from 5½d. to 6d. per hour.

The Strike at Messrs. Doulton's. — The strike at Messrs. Doulton & Co.'s Worcestershire clayfields, which commenced seven weeks ago, has become a lock-out. Some men had obtained fresh situations, but others, not receiving pay from the union, returned to work. More hands followed, but an intimation was given that union men would not be reinstated. The union executive have resolved to continue strike pay.

Bricklayers' Strike at Wellingborough.—The dispute in the building trade at Wellingborough reached a crisis on the 5th inst. by the bulk of the bricklayers connected with the district branch of the Amalgamated Society of Bricklayers, Wellingborough ceasing work. Some little time since it appears that the officials of the society on behalf of the members put in for an advance of wages, the standard rate here being 7½d. per hour, and for an alteration in the code of working rules. As, however, a halfpenny advance was obtained last year, and many of the men are already receiving more than the standard, the demand for a further increase was withdrawn, and it was decided to restrict the demand to a revision of the working rules, the chief point at issue being the number of apprentices. On some firms it is alleged the greater proportion of hands employed are boys and young apprentices, and the men desire a restriction to be put upon this, so that the number of apprentices employed in proportion to men shall be limited and defined. To this the masters demur, and, acting upon a resolution passed at a meeting of the men on Saturday, a large number of the bricklayer came out on strike.

◆

## *LEGAL.*

### IMPORTANT POINT UNDER THE LONDON BUILDING ACT, 1894.

THE case of Carrit *v.* Godson came before a Divisional Court of Queen's Bench, composed of Justices Day and Lawrance, on the 5th inst., on the appeal of the London County Council from a decision of a Metropolitan Magistrate in a matter concerning the alleged contravention of the London Building Act, 1894. It appeared from the special case that the respondents, Messrs. G. Godson & Sons, were engaged in erecting the "Horse and Groom" public-house, in St. John-street, Clerkenwell, it being a building exceeding ten squares (of 100 square feet each) in area, and to be used as a fully licensed house, but not as a hotel, the ground floor consisting of a bar, lavatory, and pot room; the first floor of a public room, lavatory, spirit store room, kitchen, larder, and scullery; the second and third floors of bed rooms and living rooms. The only means of communication between the floors is a staircase terminating in the lobby on the ground floor. The licencee would live in the building and the whole building is included in the license. A notice of irregularity required the respondents to construct throughout of fire-resisting materials all passages, staircase, and other means of approach to the part of the building to be used as a dwelling-house under Section 74 of the Act. In order to get from the street to the lobby and staircase it is necessary to enter the door in the front of the bar and to cross thence through the bar to the lobby which gives access to the staircase. The door separating the lobby from the bar is to be and the staircase itself and lobby are constructed of fire-resisting materials, but the floor and other parts of the bar are not of fire-resisting materials. The lobby which gives access to the staircase also opens into a back yard, extending from the whole width of the house, and to a depth of 100 ft., surrounded in part by buildings and in part by a wall 8 ft. high at its lowest part. There is no exit from the yard except that which leads into the lobby. The appellants contended that the building was one used in part for the purposes of trade, and in part as a dwelling-house, and was so used within the meaning of Section 74, Sub-section 2, and that the way through the bar to the lobby and staircase was, under the circumstances, a means of approach to the part of the building to be used as a dwelling-house, and that not being constructed throughout of fire-resisting materials it was in contravention of the Act in question. The respondents, however, contended that the building was not a building used in part for purposes of trade and in part as a dwelling-house; that it was not within the section; and that, even if it were, the way through the bar of the public-house to the lobby was not a means of approach to the part of the building to be used as a dwelling-house. The magistrate decided that the building was not a building used or intended to be used in part for the purposes of trade and in part as a dwelling-house, and that it was not so used or intended to be used within the section. He also held that, even if it were, the way through the bar to the lobby was not, under the circumstances, a means of approach to the part of the building to be used as a dwelling-house, and dismissed the summons.

Mr. Horace Avory appeared for the London County Council, and Mr. A. F. Wootten for the respondents.

At the conclusion of the arguments of counsel, Mr. Justice Day, in giving judgment, said that there was great difficulty in applying the section to a building of this description. The only matter in which it came within the section was because it was of the requisite size. He could not see that this was a "building used in part for purposes of trade and manufacture, and in part as a dwelling-house." A publican carried on his business all through the licensed premises. In addition, there was in this building a staircase leading to an open space, and that staircase was made of fire-resisting material. He thought that the learned magistrate's construction of the section was right.

Mr. Justice Lawrance concurred.

The appeal was therefore dismissed.

### ACTION AGAINST AN ELECTRIC LIGHT COMPANY FOR AN ALLEGED BUILDING TRESPASS.

THE case of Prifchard *v.* The Bromley (Kent) Electric Light and Power Company, Limited, came before Mr. Justice Ridley, sitting without a jury, in the Queen's Bench Division on the 31st ult. and the 1st inst. It was an action brought by the plaintiff, Mr. Alfred William Pritchard, to restrain the defendants from committing an alleged building trespass, there being also a claim for damages.

It appeared that the plaintiff in 1892 became the owner in fee of certain land and premises in West-street, Bromley, and it was said that the defendants had established in the centre of the town of Bromley, and immediately contiguous to the plaintiff's premises, extensive works for the generation of electric power and light for the purpose of supplying light and electric power to the town of Bromley and the surrounding district. It was alleged that when the plaintiff purchased his premises the situation was not as valuable as it subsequently became, the premises being situated in the centre of the town of Bromley. On the south side of the plaintiff's building there were two windows which were the only windows giving light on that side. On the western side there were three other windows and also a doorway. On the eastern front of the building there were two windows and a doorway, which said windows and doorway were alleged to have existed for about fifty years. The plaintiff's case was that the defendants by themselves and their predecessors in title had committed the following trespass and nuisance, and had deprived him of light and air to his premises:—

1. By the erection of a wall or high wooden hoarding along the entire length of the building on the south side, and only situated at a distance of a few inches from his building, and which, besides being on the plaintiff's land, entirely covered up the two windows on the south side of his premises.

2. By pulling down a boundary wall between his and the defendants' premises on the west side, and leaving the plaintiff's land and premises unprotected and covered with rubbish, and by then erecting for the purpose of their (defendants') building a very high wall, which completely overshadowed the west windows of plaintiff's building, and so deprived him of light and air.

3. By taking out foundations and laying in concrete partly on the land of the plaintiff for the said wall.

4. By trespassing on the plaintiff's land by their workmen and agents, and interfering with the plaintiff's rights.

5. By placing along the front of the building a notice board 11 ft. long and 3 ft. deep. The plaintiff further alleged that the defendants had excavated adjacent to the wall immediately adjoining his premises on which the defendants had erected for the purpose of their works a shaft or chimney stack 120 ft. high and 22 ft. at the base, which he said would interfere with his rights of property and also with his light and air. The defendants, by their defence, denied that the plaintiff had acquired the prescriptive right to light in respect of the south windows and doorway and generally denied the plaintiff's allegations. They also said alternatively that what they did was by virtue of the leave and licence of the plaintiff verbally given by him to Mr. Graty, the builder who was executing the work, in May, 1898. They further denied that the chimney stack would interfere with the rights of the plaintiff, and also that their works were a nuisance.

Mr. C. E. Jenkins, Q.C., and Mr. Yelverton appeared for the plaintiff; and Mr. Jelf, Q.C., and Mr. Hume Williams, Q.C., for the defendant company.

His Lordship, after hearing the evidence, in giving judgment, held that the plaintiff had failed to make out his case with regard to the hoarding on the south side of his premises, and on that issue gave judgment for the defendants. He held, however, that the defendants had committed a technical trespass by having placed concrete on the land of the plaintiff as claimed in paragraph 3 of the Statement of Claim and on this head awarded the plaintiff one farthing damages. With regard to the issue as to the obstruction of light and air, his Lordship awarded the plaintiff 35*l.* damages and gave him the general costs of the action. His Lordship gave the defendants the costs of all the issues on which the plaintiff had failed to prove his case.

### MANCHESTER COMPENSATION COURT:

#### CLAIM AGAINST A BUILDER AND JOINER.

ON the 1st inst. Mr. Adshead Elliott, the arbitrator appointed by Judge Parry to hear cases under the Workmen's Compensation Act, sat at the Manchester County Court to adjudicate in two matters.

In the first case, Frederick Harrison, of 248, Collyhurst-road, Harpurhey, was the applicant, and Charles Robert Richard Lambert, of Dutton-street, Strangeways, joiner and builder, the respondent. Mr. W. Cobbett, who appeared for the applicant, a labourer, twenty-three years of age, stated that his client was engaged as a labourer by the respondent, and was doing machine work at the time of the accident. This happened on January 31, at the respondent's workshop in Dutton-street. The applicant was planing a piece of wood upon the planing machine, when his right hand was caught by the revolving knives. The consequence was that he lost the portions of the first three fingers of the right hand above the second joints, and the little finger was permanently stiff. He was totally incapacitated for work at present, and had been since the accident, and would be for three months, when he would only be able to take up work which did not involve the full use of the right hand. His average weekly earnings had been 15s. 8d., and when he could return to work he might earn about 8s. a week. The amount claimed as compensation was 7s. 10d. a week. Mr. Jordan, for the respondent, denied that Harrison was planing at the time of the accident, or that he was doing machine work at all. He was told to hand pieces of wood to the foreman, and then go to the back of the machine and take the planks away after they had been cut. He had no cause to go within 5 ft. or 6 ft. of the machine, and he had no right to do anything such as he said he was doing. He was expressly ordered and told that he must not touch the machine.

The Arbitrator awarded the applicant 7s. 10d. a week until the present time, and 3s. a week afterwards.—*Manchester Courier.*

### PAVING FOOTWAYS.

AT Lambeth Police-court, Mr. Hopkins gave his decision in regard to a summons taken out by the Camberwell Vestry against Mr. Andrew James Walke, the owner of a house in East Dulwich-road, to recover the sum of 23*l.* 14s. 9d., being the apportioned cost of paving the footways of that thoroughfare. The summons, which was taken out under the 105th Section of the Metropolis Local Management Act, 1855, was first before the Court three weeks since, when Mr. McMorran, Q.C., appeared for the Vestry and Mr. Horace Avory represented the defendant. The case, which was a test one, turned upon the question whether the road was a "new street" within the meaning of the Act. The Vestry contended that it was, and proposed to pave the footways from the "King's Arms" to Goose Green, and to apportion the cost among the adjoining owners. It was admitted that some years since the Vestry tar-paved the footpaths, but it was contended that the work which was then done was in the nature of temporary as distinguished from permanent works. For the defence it was argued that the tar-paving put down by the Vestry was in the nature of permanent work, and that consequently they had exhausted their powers under the 105th Section of the Metropolis Local Management Act. Mr. Hopkins remarked that if he thought the decision in this case really turned upon the question whether or not the road could now be held to be a new street within the Section, he would feel compelled to arrive with considerable doubt at the conclusion that it might so be held. But the case was evidently so near the line, as he understood the cases, that he should state the agreed facts for the information of the Divisional Court, and leave the decision upon that point to the Court, as he was not able upon that point to find any fact outside the agreed facts which would help the Court to a conclusion. But he thought the decision might turn upon another point, and might be reached by a shorter road than the difficult question of a new street or not. He enumerated several findings which he considered brought the case within the case of the "Camberwell Vestry *v.* Hunt," and did not think the Vestry could support an assessment upon the frontagers. He therefore dismissed the summons. On the application of a solicitor representing the defendant, Mr. Hopkins allowed twenty guineas costs as against the Vestry. —*Times.*

◆

## MEETINGS.

FRIDAY, JUNE 9.

*Institution of Civil Engineers.*—Engineering Conference (concluded).

*Institution of Junior Engineers.*—Visit to the Bankside Works of the City of London Electric Lighting Company. 6.30 p.m.

MONDAY, JUNE 12.

*Royal Institute of British Architects.*—General (business) meeting (1) to receive report of scrutineers *re* election of council, committees, &c., for next session; (2) election of candidates for membership; (3) Mr. H. Hardwicke Langston to move the following resolution: "That in the opinion of this meeting it is desirable to put a suitable and prominent inscription on the street front of No. 9, Conduit-street, indicating that those premises are occupied by the Royal Institute of British Architects"; (4) to receive and consider the Report of the Special Committee appointed by the Council to consider the Administration of Building By-laws in non-Metropolitan Districts. Also to receive and consider a resolution on Party Structures, passed by the Special Committee above mentioned, and approved by the Council. 8 p.m.

WEDNESDAY, JUNE 14.

*Carpenters' Company.*—Examination at their Hall. 6 to 10 p.m.

THURSDAY, JUNE 15.

*Society for the Encouragement of the Fine Arts.*—Third conversazione.

*Society of Antiquaries.*—8.30 p.m.

*Institute of Sanitary Engineers (Incorporated).*—Half-yearly general meeting for the reception of balance-sheet, annual reports, &c. 8 p.m.

*Carpenters' Company.*—Examination at their Hall. 6 to 10 p.m.

FRIDAY, JUNE 16.

*Carpenters' Company.*—Practical Examination at the Company's Schools, Great Titchfield-street. 9.30 to 5.30.

SATURDAY, JUNE 17.

*People's Palace Architectural Society.*—Visit to Drapers' Hall, E.C. 3 p.m.

*Carpenters' Company.*—Viva Voce Examination at the Hall. 12 noon.

*Incorporated Association of Municipal and County Engineers.*—Northern District Meeting at Whitehaven.

### ACCEPTED SPECIFICATIONS.

### *Open to Opposition until July 31.*

[1898] 11,377, Fowler, Manufacture of Acetylene. 11,473, Hartley, Coal-saving Attachment for Fire Ranges, with a Bar for Flat Irons and Cooking Purposes. 11,837, Loesche & Zschunke, Stone Cutting Machine. 11,847 and 14,498, Hargreaves & Poulson, Sand, &c., for Making Moulds and Cores. 11,944, Gimsons, Tack or Nail Driving Machinery. 12,011, Deimel, Lehmann, & Sylten, Electrical Gas Igniters. 12,211, Wood, Varnish. 12,470, Krassellet, Hinges. 12,548, Weir, Brickwork of Water Tube Steam Boilers. 13,408, Addicott & Holland, Ash Curbs for Fireplaces. 13,968, Forbes, Acetylene Lamps. 14,144, Parkinson, Generator for Acetylene Gas Lamps. 14,303, Robinson, Public Lamp Standards. 14,773, Rippingille's Albion Lamp Co. & Hancock, Closing Devices for Oil Containers of Oil Lamps and for Oil Cans, &c. 14,824, Babbe, Pannikins for Carrying Meals. 15,046, Ozias, Weighing Apparatus. 15,084, Simmance & Abady, Rapid Water Heating by Gas, &c. 15,466, Brierley, Outdoor Seats. 15,900, Causer, Rack Pulleys. 15,921, Cocker, a Dust, Draught, and Rain Excluding Appliance for use with Sliding Window Sashes. 16,076, Spiers, Construction of Portable Sectional Buildings of Wood and Iron, or other Composite Materials. 16,132, André, Gas Cooking Apparatus, Ovens, &c. 16,156, Halls & Halls, Incandescent Gas Burners. 16,228, Williams & Normanton, Cord Shortening Apparatus for Lamps. 16,295, Rix, Moulding Pottery, &c. 16,348, Rutnagur, Water-waste Prevention. 16,358, Leggott and W. & R. Leggott, Regulating Skylights. 16,454, Slating Roofs. 17,153, Bysouth, Stair-treads and Coverings for Subways, Landings, &c. 21,328, Greenwood, Guards for Circular Saws and Similar Machinery. 22,277, Müller & Gareis, Automatical Gas and Vapour Igniters. 23,454, Dey & Dey, Workmen's Time-recorder. 23,832, Wise, Derrick Swinging Gear. 26,006, Butler & Minty, Sliding Window-sash Fastener. 26,129, Standing & Dixon, Intermittent Siphonic Flushing Apparatus. 26,790 and [1899] 6,028, Allgemeine Elektricitäts Gesellschaft, Current Conducting Connexion between Electrical Conductors and Electrical Resistances with Small Heating Capacity. 27,358, Cassels, Combined Bath and Washbasin. 27,506, Alda, Doors for Use in Ventilating Mines and for other purposes. [1899] 2,371, Naturin, Regenerative Gas Burners. 4,774, Heaton & Smith, Electrical Cut-out or Fuse. 5,375, Merz, Saws or Sawing Devices for Cutting Metal Cold. 6,152, Heard & Snyder, Subdividing Laminated Material. 6,266, Cheffins, Cranes for Excavating and Dredging. 6,311, Gehre, Artificial Stone. 6,584, Horst, Interchangeable Coal and Gas Grate. 6,967, Sayre, Holders for Lamp Globes, Shades, and Reflectors. 7,086, Almon, Machines for Sand-papering, Dressing, or Finishing Wood, &c. 7,579-80, Cloos, Electrical Switching Apparatus. 7,628, Jordan, Stove Cover and Gas or Vapour Burner. 7,966, Feltus, Combination Tool. 8,231, Marshall & Faulds, Baking-ovens. 8,387, Körting, Ceiling Blocks and Slabs. 8,388, Browne and Fraser & Chalmers, Raising Water from Mine Shafts and other places. 8,395, Smethurst, Means for Securing Wires in Fencing Standards, &c. 8,401, Folding Cabinet for Vapour and Hot-air Baths. 8,541, Klein, Flushing Apparatus. 8,547, Park, Centrifugal Pumps, especially those used in Dredging Operations. 8,733, Smillie, Screw Cutting Tools. 8,796, Woolliscroft & Todd, Presses for Bricks and other Blocks. 8,820, Staveley & Parsons, Electrical Signals or Indicators.

### ABSTRACTS OF PATENTED INVENTIONS.

2,784.—Electrical Switches: *O. C. Immisch.*—The purpose of the invention is to prevent injurious sparking at a switch's main contacts; a contact is carried on, but is insulated from the switch arm, and when the main contact is broken, a circuit is completed through another contact, a core, and a coil, the core being at once drawn up, whereby the circuit is broken.

2,812.—Walls, Slabs, and Paving: *J. W. Klinck & W. Cooke.*—Facing-slabs are fashioned with tongued and grooved interlocking edges, and with grooves in imitation of brick-work joints, and are secured in position by means of nails; they are composed of, preferably, clay or cement, or other materials to simulate stone or brick-work, and can be used for paving purposes.

2,822.—Fire-Proof Ceilings: *F. Cohn & H. G. B. Brunckhorst.*—The ends of fire-proof blocks are stepped to rest upon strips or ribs of the joists or upon the lower flanges of iron girders, whilst their sides are grooved and tongued, cement or mortar is filled in the spaces below the joists and girders and supported by network or gratings; for moulding the blocks, are used boxes having angle-iron sides and locked ends, and a transverse partition is made movable by rack and pinion gear between the sides of the box so that the blocks may be moulded in different lengths.

2,896.—Portland Cement: *E. H. Hurry & H. J. Seaman.*—A crusher or mixer delivers the cement-rock by a chute into the buckets of an elevator, whence the rock is fed by gravity to a pulveriser, and then to a bin which supplies a rotary roasting furnace mounted upon roller bearings, and projecting into a chamber fitted with an ash-pit and leading to a chimney stack; the cement, in the shape of slurry, may be pumped into the furnace wherein a burner, which injects high-pressure air and powdered fuel, roasts the material to clinker; a rotary inclined cylinder conveys the clinker to a reducing apparatus, where it is wetted; the material is next passed through a rotary cooling conduit (see Patent No. 23,145 of 1895), and the process is completed by the conveyance of the cooled clinker, by means of an elevator, to a bin which supplies a pulveriser.

2,955.—Safety Appliance for Lifts: *J. Stannah*—A pipe connects the plunger to the ram cylinder, the plunger having an area greater than that of the supply port of the hydraulic slide valve; the pressure lifts the plunger clear of the slide valve, but in the event of injury to the main the pressure upon the plunger's outer end exceeds that upon its inner end, forcing it against the back of the slide valve which it thereupon locks.

2,963.—Fire Escape Ladders: *W. J. Worth.*—The ladder sections are extended or retracted, and so held, by an arrangement of bell-crank stops to which is connected the rope which passes over pulleys at the ends of the sections in such a manner that, when the rope's free end is pulled, the stops become disconnected from the rungs upon which they act, and when the strain is relaxed the stops again engage, automatically with the rungs, under the action of spiral springs; the stops can also be controlled by a separate rope instead of by springs.

2,973.—Casting Pile Shoes: *A. Harris.*—As an improvement upon the Patent No. 14,815, of 1884, the inventor casts the points of the shoes in a chill or mould about iron or steel bars, which are made to interlock with the cast metal by being bent inwards or being rounded, bevelled, or serrated; the dove-tailing may be effected also by inserting rivets through holes in the bars. During the operation of casting the bars are held in their places by clips upon standards of the moulds, or the clamping bars may be secured by screws in inclined slots in the mould.

2,993.—Water Waste Preventers: *W. Tordoff.*—At the bottom of the cistern, which, under normal circumstances, is empty, is a valve suspended by rod, which has a slot through which the float-arm passes, the float-arm being connected by links to a rocking-shaft that carries a tumbler; when the chain is pulled the tumbler falls over, and so both closes the valve and lets the float-arm fall to open the inlet. As soon as the cistern is filled the rising float tilts the tumbler up again and so closes the inlet, and opens the valve for flush delivery; the rocking-shaft is connected to a tipping basin, whence leakage may be discharged into the overflow pipe beneath.

3,067.—Repair of Lift Valves: *E. J. Barker.*—To facilitate repairs, a socket piece, screw-threaded to engage with the casing and having a handle, is connected to the valve, the lowering of the valve to connect the inlet and outlet causes a plug that rests upon the valve to fall too, then, if the valve and socket are taken out the plug descends to close the opening next above the valve.

3,107.—Emptying Service Pipes: *H. S. Paige.*—The contrivance is for emptying service and supply pipes during frosty weather without discharging the water from the supply cisterns; at the entrance of the service pipe is a ball valve which a pull-chain attached to a lever within guide-rods normally raises out of action, whilst a weight upon the valve rod closes the valve on the chain's release; an inlet tube above the cistern admits air to the service pipe; a cut-off cock connected to a two-ways draw-off cock by toothed wheels is fitted to the supply pipe from the main, so that one cock is closed when the other is opened; to empty the supply pipe one should draw enough water from the cistern to slightly open the ball-cock and admit air into the pipe—if the device is used for a water-supply system wherein the service pipes are supplied directly from the main, the air enters the supply pipe through one of the service taps.

3,139.—Measures of Length: *C. J. M. Bonnefoi.*—In order to vary the relative motion so as to give correct readings for different scales of plans and maps, a roughened cone is placed on the face of the wheel carried by an arm concentrically with the pinion, as an addition to the gear which transmits the roller's movement to the index hand upon the spindle of the pinion; the cone bears against the wheel's rough edge, and the required velocity ratio is to be attained by changing the cone's position by means of a connecting rod, a screw, and a milled head, the scale at which the instrument works is indicated by a pointer that moves over a scale at the back.

3,145.—Combined Square, Ruler, and Protractor: *J. A. Labat-Guilmant.*—The contrivance, for use on drawing-boards, comprises a double T-square, having two blades and two stocks, whereof one is normally pressed against a handle upon the other by a spring, the other stock is faced with metal plates, and the former stock with rubber nipples, one blade carries an adjustable block (also faced with rubber nipples) through which the other blade can slide; the instrument can be made to move up and down the board by pressing the stocks together, upon their release the rubber nipples grip the board's edge. To a sliding block upon the blades is pivotted another graduated blade, which is set to any desired angle by a link and a sliding block.

3,150.—Sash-fastenings: *G. W. Westgarth.*—In a bracket on the lower sash is pivotted a lever having a slot and a balance weight at either end, the slotted end passing through one or other of the holes in a standard of the upper sash and engaging with tapered cross-pieces, and the slot's face taking a vertical position when the parts become so engaged, the action of closing the sashes knocks back the weighted end of the bracket when it is in the disengaged (or turned-over) position, and so causes the sashes to become automatically fastened.

---

* The prices named are for the wood as imported and landed in the docks. Ten per cent., approximately, should be added in order to arrive at the current trade prices.

3,178.—Soldering Apparatus: *M. Tomellini & G. Francia.*—Means are provided for cooling and drying the hydrogen in a generator of oxyhydrogen flame used in soldering aluminium, &c.; the zinc is laid on a grating in one vessel and the dilute sulphuric acid is introduced through a pipe leading from a vessel above; the generated hydrogen passes through a pipe and washing vessel, which condenses vapour produced by the heat of chemical action, when the latter pipe is closed (by a tap) the dilute acid is forced, by pressure of the hydrogen, below the zinc and arrests the action; the gas, dried and cooled, passes to a bronzed branch pipe, one branch being connected to the burner, and the other branch to the air-supply. The latter supply branches have taps for security's sake.

3,207.—Electrical Arc Lamps: *S. Bergmann.*—In a guide tube moves a carbon holder, consisting of a split tube attached to a body and stem, wherein slides a block, the holder being guided within the tube by a ring of balls, which are placed between the block and the body and make electrical contact with the tube; pressure of the block against the balls may be obtained through its own weight or by means of a spring held by a cap screwed on to the stem.

## TO CORRESPONDENTS.

A. H.—J. B. R. (Amounts should have been stated). A. E. K. (Sent too late).

NOTE.—The responsibility of signed articles, letters, and papers read at public meetings, rests, of course, with the authors.

*We cannot undertake to return rejected communications.*

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

We are compelled to decline pointing out books and giving addresses.

Any commission to a contributor to write an article is given subject to the approval of the article, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and *not* to the Editor

## TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us *not later than* 10 *a.m. on Thursdays.* N.B.—We cannot publish Tenders unless authenticated by the name and address of the sender; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is given, nor any list in which the lowest Tender is under £100, unless in some exceptional cases and for special reasons.]

* Denotes *accepted.* † Denotes *provisionally accepted.*

## *Restoration of Hexham Abbey.*

AFTER many centuries of decay, neglect, and ill-usage, Hexham Abbey Church is now to receive the attention which is necessary, not only to preserve the existing portions in repair, but to fit it for the requirements of its present use as the parish church. The fact of its actual use in this capacity should not be overlooked, as the object of the work to be done, under these circumstances, is not mere restoration, but the placing of the building in a fit state for its present practical requirements.

The existing condition of things was one that could not under any circumstances continue much longer; and the recent growth of the town as a residential resort, the fact that it only possesses one church, and that only a portion of that is available for seating a congregation, clergy, and choir, rendered it imperative that a change should be made, and that at once. An appeal was made last year to the public on behalf of the abbey for general repairs and improvements, and a sum of 3,500*l.* was raised in a few months. A large committee was appointed, which includes the Bishop of Newcastle, Canon Greenwell, the President of the Architectural and Archæological Society of Durham and Northumberland, and some of the most influential residents in the district. Mr. C. C. Hodges, of Hexham (whose monumental book on the abbey is well known), has been appointed as acting architect, in conjunction with Mr. Temple Moore, of London, as consulting architect. These gentlemen have made a careful survey of the building, and have submitted their Report to the committee, which has been adopted unanimously. The Report is too long to print *in extenso;* but we may give a summary of it.

The first section deals with all the repairs needed to be done to the fabric. These are very considerable, and embrace a number of things not of general interest, and which we need not mention in detail. There is nothing, however, recommended in the form of "restoration" in the sense in which the word was used by the architects of thirty years ago. Simple repairs are all that are advised, no skinning of the surface either internally or externally, so that the ancient and rugged appearance of the church will remain as it is. The urgent repairs are to be dealt with at once, and the other sections are to be taken in regular order, so that the whole can be accomplished during the next few years.

The body of the Report is occupied with what is of greater general interest, viz., the scheme proposed for the extension of the church; and in order that our readers may grasp its true significance, it will be necessary to devote a few lines to the history of the fabric.*

An early Romanesque church was built at Hexham under St. Wilfrid about 673. This church was extended on a rebuilding scheme towards the close of the twelfth century, but never reached completion, as the nave had not been rebuilt when the church was burned by the Scots in 1296. The early nave seems to have remained as a ruin for another century, and the rebuilding was not attempted till near the close of the fourteenth century. The work was begun, but never finished. The impoverishment of the house, and the general decrepitude of the Augustinian order to which it belonged, delayed the work so long that the dissolution of the monasteries found the nave little more than begun, and put an effectual stop to its continuation.

Hexham Abbey has, therefore, remained as a naveless church, and though the transepts are of unusual proportions, it has an appearance of incompleteness which detracts much from its character. The existing plan is that of the letter T. It is not without companions in distress, and curiously enough the only three cathedral churches which belonged to the Augustinian order—Carlisle, Bristol, and Oxford—are somewhat parallel cases. Carlisle still remains to all intents and purposes a naveless church, as six of its original eight bays are gone. Oxford had its nave cut down to a length of four bays by Wolsey, when he took the church over to form the chapel of his newly-founded college at the time of the dissolution.* Bristol has been more fortunate. Its Norman nave remained till the sixteenth century, when it was removed by Abbot Elliot with a view to a rebuilding in the style of his time; but his death in 1526 stopped the work, and the dissolution ten years later caused it to be abandoned. The church remained incomplete till 1876, when the new nave was begun from Mr. Street's designs, but its western towers were not finished till 1888 under Mr. Pearson. Within the last two or three years the roofless nave of Dunblane Cathedral has been restored, and is again in use after having been a ruin since the Reformation. St. Mary's Church, Southwark, has had its nave rebuilt, to reproduce as nearly as can be what the destroyed one was. Christ Church Cathedral, Dublin, has also of late years been recovered from a state of semi-ruin and its nave rebuilt. In these two latter cases the rebuilding in the style of a past age may, we think, be justified. The building of a complete modern church in imitation Mediæval style has of course nothing but fashion to justify it. But architecture is design as well as history, and in adding to an existing ancient church, harmony of architectural style and design must be taken into consideration.

Among smaller conventual churches there are a few instances of ruins being restored for use as churches of the reformed religion. Abbey Dore was repaired and given to the parish in 1634 by Lord Scudamore. Blanchland Abbey, in Northumberland, was a ruin till the munificent Lord Crewe, Bishop of Durham, restored it and gave it to the parish in 1752. The church of the Augustinian Priory at Brinkburn, on the Coquet, was restored 1858-60, and made a parish church at the cost of the late Mr. Charles Hodgson Cadogan, the owner of the estates.

---

* For a description and illustrations of Hexham Abbey, see the *Builder* for April 1, 1899.

* The remainder of the English cathedrals have their plans practically complete. Norwich has lost its Lady Chapel, Hereford the western bay of its nave, and Ely the north wing of its western transept.

What has been done at Bristol and other places can be done at Hexham. The congregations are now too large for the accommodation. The church is full to overflowing, and it is felt that the whole of it is wanted, and that it should all be used as one church. The intention is, therefore, to build the nave, and put in it the seats now in the choir, to seat portions of the transepts with chairs, and to clear the choir so that it may be brought back in great measure to its condition before it came to be used as the congregational part of the church.

The only difficulty in the building of the nave is that of cost, and there is little doubt that this will be overcome. The site is a portion of the old churchyard, which has been closed for forty years. The foundations of all the walls are in existence. The south wall is standing for its whole length to a height of 16 ft., and is 6 ft. in thickness. The west wall is standing to the same height, and is 7 ft. 3 in. in thickness. It contains the western doorway to its full height, though robbed of its moulded archstones and built up. There is a curious chamber in the thickness of the wall, and entered by a small arched doorway in the south reveal of the longer doorway. This chamber is covered with flat stones, which are grave covers with crosses on them. There is the lower part of a newel stair in the wall, between the western respond and the great buttress projecting to the west on the line of the arcade. The base of the respond remains complete, and has a moulding of very simple section. There was an aisle on the north side only, with an arcade of six bays.

The newel stair was approached by a doorway in the north-west angle of the aisle, from which a mural passage is carried southwards to the line of the arcade where the well of the stair is placed. A small portion of the west front at its south end is of thirteenth century date, showing that the nave formed part of the rebuilding scheme of that time. This fragment has a bold base moulding with a straight slope and a throated weathering. The base course of the fifteenth century work on the west and north sides is a plain hollow. It is clear, from the details of the western processional doorway, that the work was recommenced before the end of the fourteenth century; and that it was in progress in the fifteenth century is shown by the details of the west end, and the mention of the work in Roger Thornton's will in 1429. Carter's plan, which was made in 1795, shows the jambs of the south-west window, and the gallery in the wall, which was carried through at the level of the window-sills. A slight sketch of the jamb moulding on the same plan shows that it was of the same character as that of the base of the respond which remains. That the work ever rose much above the level of the window-sills is improbable, and that it was never finished is clearly shown by the condition of the east wall, which has never been protected by a roof since it was built.

It is proposed to build the nave in the plain and massive phase of the "Perpendicular" style which is peculiar to the North. Owing to the wars with Scotland and the impoverished condition of the border country in the fourteenth and fifteenth centuries, "Perpendicular" work is almost unknown in Northumberland and the bishopric of Durham; there is more in the castles than there is in the churches; and it is not until Yorkshire is reached that any of the larger churches show much work of this period. The architect has therefore a free hand to a large extent, and should produce what Edmund Sharpe would have termed a piece of "Cistercian Perpendicular." The main features of the design will be a range of lofty traceried and transomed windows in the south wall, which is 60 ft. in height; a west front, with a single doorway and a large window over it, and an octagonal turret as a termination to the newel stair. The single aisle on the north will be divided from the nave by an arcade of six bays, above which will be a clearstory. The roof will be of oak with moulded beams and braces, similar to the roofs on the choir and transepts.

In dealing with the rearrangement of the church, the only difficult problem the architects had to solve was the treatment of the rood screen. This is an exceptionally fine one with close panels, and, as far as its western side goes, has escaped alteration, or much mutilation. Its removal was out of the question. It is therefore proposed to render it an open screen during the time of service by hinging the main panels on the west side, so that there will be five large openings. These can be closed at other times, so that the present appearance of the screen will remain unchanged. The long range of picture panels placed above the loft will be removed, as they are no part of the screen, and cannot be seen where they are. They were fortunately saved at the Dissolution and fixed up to act as an auxiliary screen to the choir before the days of heating apparatus. They show a valuable series of mediæval paintings of three classes, the "Dance of Death," scenes from the Passion, and pictures of Northumbrian saints. They will be carefully cleaned and placed where they can be seen to advantage. The east side of the screen is modern in its lower part. This will be altered and made an open arcade with a suitable ceiling under the organ gallery. The organ is a fine one, and suits the church. It will remain where it is, but will be clothed with a new front of suitable character towards the west.

The choir stalls, of which about half remain, will be replaced [in their old position at the west end of the choir, with four return stalls on each side at the west end. The original number of thirty-eight will be made up again. The old book-boards will be replaced, and seats for choir boys arranged in front of them. The ancient pulpit with painted panels will be fixed on the north side of the choir for use at occasional services. A new pulpit with reading desk will be placed against the south-west tower pier, so as to command the four arms of the church. The four-stalled sedilia of oak will be placed on the south side of the choir in the second bay from the east. It is now a piece of lumber in the vestry. The small detached chantry chapels of Sir Robert Ogle, who died 1410, and Prior Rowland Lexhman, who died 1491, will be replaced in their original positions, from which they were removed in 1858. The altar tomb and effigy of Prior Lexhman will again find its its proper position outside the chapel. The Ogle chantry was entirely of oak, and the greater portion of it is still in the church, and it can easily be reconstructed. The matrix of the brass of Sir Robert Ogle and a portion of the brass remains.

A new altar of full size will be provided, and will be brought to the west to the extent of half a bay, and a screened enclosure formed with returns up to the first pair of piers from the east. The reredos will be of oak, carved and gilded with painted figures in a range of canopied niches, and a rich carved and gilded cresting. The enclosure will be partly formed of the very fine series of seven panel paintings of some of the bishops of Hexham, which are preserved in the church, and were executed between 1464 and 1476. The remainder of the enclosure will be made up of new work of similar design to the old.

The monumental effigies will again be treated with proper respect. That of Gilbert de Umfreville (*obiit* 1307) will be replaced in its old position on the south aisle of the choir. The other three will be placed between the columns in the choir, raised on plain stone bases. The font will be moved to a suitable position in the south transept, and its fine carved canopied cover, the fragments of which are still in the church, and which was broken up and nailed in front of a gallery, like hawks on a barn-door, in the last century, will be reconstructed and placed on the font. It is a fine example, though late, and has fellows at three of the churches in Newcastle, as well as at Selby, Thirsk, and Well in Yorkshire. A vestry will be formed in the south bay of the south transept aisle, and the screens to divide it from the church will be partly composed of the old parclose screens which formerly screened off a chantry chapel in the same place. The old internal wind porch, of eighteenth-century date, will be re-used as the wind porch to the south door.

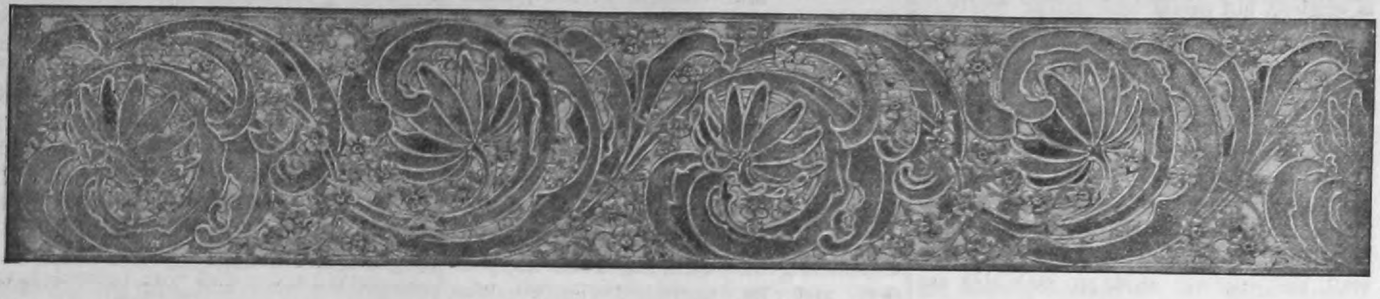
In this way the great store of ancient carved and painted woodwork in the church will be utilised, and with reference to this the Report says:—

> "We feel that the greatest care should be taken of the ancient woodwork left in the church, an inheritance of which Hexham may feel justly proud. In dealing with it, it should be treated with tenderness and veneration, and should only be moved in order to treat it with greater respect than has hitherto been shown to it, and to bring its beauties into greater prominence."

The floor of the choir was altered and relaid 1858-60. It will be taken up and the old steps and levels recovered. These are given on Carter's plan. There will be an opportunity of finding the remaining foundations of Wilfrid's church, which should not, in the interests of history, architecture, and archæology be lost. Valuable discoveries are almost sure to be made, as the site of the nave is the site of the body of Wilfrid's Church, and is the spot where many of the pre-Conquest stones have been found.

The nave is estimated to cost about 8,000*l.* if built in a plain manner. The Committee state that no mischief will be done and nothing will be destroyed; everything will be brought out, located, and utilised in a better manner than at present. Hexham Abbey will then rank as one of the complete cross churches which are used in their entirety, as Selby Abbey has lately come to be.

The architects' Report closes with a list of some cross churches (not the large cathe-



*Design for a Frieze. By Mr. A. L. Gwatkin.*

drals) which are used as a whole, and gives their dimensions to show that the congregation at Hexham will see and hear as well as in other large churches of the same type, which, as originally designed, were not intended to be used solely, or even primarily, for congregational purposes.

◆

## ARCHITECTURE AT THE ROYAL ACADEMY.—IV.

### DECORATIVE WORK.

THE purely decorative designs at the Academy are not very numerous. We may take first the designs for stained glass, the decorative art most closely connected with architecture, but which of course is but very inadequately represented by coloured drawings. If the Royal Academy were really what its title professes—an academy of "arts," there would be a space provided for the exhibition of actual stained glass, in a proper light, as is the case at the Paris Salon; and since the best stained glass produced in England is quite superior to the best produced in France, it is the more to be regretted that our own Academy has no means of exhibiting the glass itself, and that probably most of its members care nothing about the subject. The drawings, however, enable one to form an opinion of the design, and some idea as to the effect of colour intended.

The great shortcoming in modern stained glass consists in the apparent impossibility, on the part of most designers, of getting out of the mediæval groove. The revival of stained glass in this country came in with the general mediæval revival, and consequently the old formula of saints under canopy-work, which is imitated more or less closely from architectural detail of the same class, seems still to be, with most people, the only ideal of a stained glass window. Designs like that of Messrs. Shrigley & Hunt for the north transept window of Doncaster Church (1,696), are in fact little more than a kind of church furniture, in reference to which not even the actual designer's name is given, and all that can be said of this example is that it is a respectable specimen of its class. Messrs. Percy Bacon & Brothers' stained glass window for St. Aidan's Church, West Hartlepool (1,697), though of the usual general type, shows some special character and very good taste in the treatment of the accessory detail in which the figures are framed—small and delicate work, with a good deal of white glass introduced amid the colour. Mr. Dix's "Design for Window for St. Stephen's Wittenhall," and Mr. Langsford's "Memorial Window, Wembley Parish Church" (1,689 and 1,690) are exhibited as personal work and not as that of a firm, but present no special characteristics to differentiate them from many other windows. Mr. Steggles's "Design for Stained Glass Window" (1,691) has the merit of being a very pretty little drawing, and of showing some little originality in the manner in which the Late Gothic architectural detail is modified to take its place in a window. The staircase window for Fenham Hall, by Messrs. Shrigley & Hunt, escapes from the mediæval pattern, and is a nice bit of design. The window is a narrow one with a semi-circular head, and contains three detached circular medallions, the upper one concentric with the window head, occupied by small figures; the spandrel spaces between the medallions are partly filled by square projections from the line of the border; the white space is diversified with rather delicate conventional ornament of a Renaissance type. This is a window out of the common, and the designer's name should have been given. After the informal but decisive announcement made in our columns before receiving day at the Academy, that in the case of architects "employing artists" the artist's name would be given in place of that of the firm for whom the design was made (a threat which does not seem to have been carried out), we cannot but wonder how it is that firms who manufacture and sell stained glass but do not give the name of the designer are allowed to exhibit at the Academy under the name of the firm, stained glass being necessarily a more personal form of design than even architecture.

The architect's collaboration with the stained-glass artist is illustrated in the elevation drawing of the interior east end of St. Luke's, Enfield (1,719), exhibited by Messrs. James Brooks & Son. This shows their architectural arrangement which forms the frame for Mr. Westlake's stained glass and decorative paintings, and under the circumstances should properly have been exhibited under the joint names of Messrs. Brooks and Mr. Westlake. It is illustrated and described in the present issue (see under head of "Illustrations"). In Mr. Dix's "Design for Window, St. Mary's, Windermere" (1,805), the angels who are attendant on the principal figures form a decorative background which takes the place of the usual canopy work; a detail to be welcomed as an escape from the conventional groove. Mr. Whall's "West Window of Private Chapel, Douglas Castle" (1,702), at once shows itself as original design; the shields in colour have a very decorative effect, but we can see no beauty or appropriateness in the ragged and almost realistic lines of the tree-like divisions of the window. Mr. Stephen Adam's "Design for Stained Glass Memorial Window" (1,808) indicates some fine colour, and the treatment of the figures is effective and not commonplace; why then did he spoil a good design by introducing a landscape with a winding river behind the figures? Such a treatment is absolutely absurd in stained glass, destroying its whole character as a window—a glass plane for transmitting light.

Wall decorations naturally group with stained glass; requiring somewhat of the same general character of treatment, only for reflected instead of transmitted light, and dispensing with the element of leading or other supports. Mr. Victor J. Robertson's "The Four Seasons" (1,712), a wall painting in a semi-circular lunette (part of the space of which, however, is cut into by a door) is, though small, the most important of the wall decoration exhibits, as it is in fact the only one in which the figure is the principal element. The design consists of several draped figures grouped together and characterising the four seasons; the composition is a good one and the colour pleasing; perhaps for a decorative painting a little more severity of line would have been an improvement. In "Decoration to Walls of a Music Room" (1,713) Mr. James Millier shows a pretty and carefully-drawn elevation of the side of a room with details in the Adam style (including exceedingly long and meagre Corinthian pilasters), on one half of which the intended heightening of effect by gilding is shown: the whole effect is very good, but there is not an original stroke in it; it might all be got out of books. Mr. Temple's "Bath-room Dado" (1,692) is a good bit of decoration; in the lower portion are gilt panels with symbolical water lines on them; between these rises the stem of a plant which, above the panel line, puts forth leaves and branches in a decorative angular manner, enclosing a purple flower in the centre. A very original piece of wall decoration is Mr. Frank Murray's "Decorative Frieze for Board-room, P. and O. Steamship Company" (1,744); a portion only is shown; the frieze is divided into compartments by short pilasters flanked on each side by a kind of flat decorative indication of an ancient ship's prow; these features, facing each other, make convex borders to a painted panel between, with a marine subject on it. This is a clever bit of work, and not like anything we have seen before. In "Poppies: Design for a Frieze" (1,801), Mr. E. M. Atkins shows a flowing piece of floral design rather recalling Classic acanthus foliage than any more modern choice of vegetation; it is rather cold and uninviting in colour. Mr. Gwatkin's design for a frieze, of which we give an illustration, is a good bit of design in conventionalised floral forms. There is also near this a sheet of nine "Designs for Textiles," by Mr. Alfred Carpenter (1,798), all of which are good both in a decorative and in a textilean sense. Mr. Elwood's "Study for a Wall-paper" (1,701) is original, but would look rather spotty in execution.

One or two designs for the treatment of rooms, which might have been included under our last article, may be mentioned here. Mr. Geo. O. Scorer's "Hall Interior" (1,747) is a coloured elevation showing an effective treatment got by simple means. There are three elliptical arches with terra-cotta archivolts cutting into a plain plastered wall, the narrower ones on each side are windows, the wider one shelters the fireplace or ingle-nook, with a plain red-brick backing and a tile dado with vertical stripes of green below this; the actual fireplace is built up in the centre in stone. The drawing is well executed and the effect of the whole good. Then there is another interior of a room by Mr. Baillie Scott—"Drawing-room, Chaplain's house, St. Mary's Home, Wantage" (1,802), with the same combination of colour as his other interior (1,823) mentioned last week, though hardly of the same interest. Mr. Elwood's small drawing, "Design for a Chimney-piece" (1,700) deserves attention as a bit of really original work; the chimney-piece itself is a broad thin slab supported on colonnettes, and carrying a kind of semi-circular apse erection coloured red, and the lower part of which is divided by miniature pilasters into four compartments each enclosing a painted figure. The lamp shades are affixed to and hung over from the ends of "apse" in a characteristic manner; altogether an original little design. Lastly, we must not overlook Mr. Skipworth's drawing of altar and retable hangings in the Lady Chapel, Rochester Cathedral (1,795), which shows, as usual with his designs for work of this kind, some very delicate pierced and carved detail, the altar-slab, of marble, being framed in a wooden structure with figures carved on each side on the background of pierced work; at the back of the altar are the retable hangings, of blue at the sides, with a white centre on which is worked a figure of the Virgin.

On the whole, in spite of various drawings which are pleasant and interesting for study, the architectural room cannot be said to be a very exciting show this year.

◆

## NOTES.

The Dublin Corporation Bill.

It is not usual for a Bill, which is in a true sense a local Bill, to be discussed in the House of Commons. It was as well, perhaps, that a short debate, however, should take place, as it did on Tuesday, on the Dublin Corporation Bill. This measure enlarges the area of the city of Dublin, and takes into it various outlying districts. It was attempted in the House to alter the decision of the Select Committee by which, though not unanimously, the Bill had been approved. No enlarging measure of this kind ever fails to be opposed, because there are always a number of interests which may be touched; but there cannot be a doubt that these enlarging measures are best alike for the central portion and for the outlying districts. Sanitary affairs are more cheaply and efficiently managed. There is often in small districts an apparent economy which is not in the end a real saving. We have no doubt that in a few years the outlying districts which will become part of the City of Dublin will be the better for the measure.

The London Gas Inquiry.

MR. GEORGE LIVESEY, Chairman of the South Metropolitan Gas Company, was last week heard by the Select Committee of the House of Commons. In his opinion, "persistent incapacity and incompetency all through" in the working of the Gas Light and Coke Company's business is the sole reason why gas is not sold by this company as cheaply as by the South Metropolitan Company. Considering the advantages of its position, and its unrivalled opportunities, the great company might be, and ought to have been, selling gas at the lowest price in the metropolis, said Mr. Livesey. Referring to meter rents, he said that he did not consider it fair to put the charge for meters on to the price of gas, because some consumers used more gas than others. The abolition of meter rents by the Gas Light and Coke Company did not, in his opinion, really benefit the consumers, because the ¾d. per 1,000 cubic feet of gas, which is the equivalent of the meter rent, is paid for in the higher price of gas. If meter rents had not been abolished, the price of gas could have been proportionately reduced. This is true, but it would still leave a difference of 9¼d. between the prices charged by the two companies. Mr. Livesey put forward a mass of facts and statistics to support his charge of mismanagement against the Gas Light and Coke Company, and those interested in gas matters generally will find much food for study in his evidence. Little or no advance has, however, been made towards devising a method of working which will enable the offending company to reduce its gas charges to the level of those of either of the other two metropolitan companies.

Bow Church Restoration.

As intimated in our issue of last week, the venerable parish church of Bow was re-opened on the 12th instant by the Bishop of London. Much comment has been evoked by the appearance of the three oak tie-beams which have been inserted in the nave to prevent the further spread of the walls. These beams have, we understand, been left in their present rough, unmoulded, and unsightly condition at the special request of the Society for the Protection of Ancient Buildings, which is apparently of the opinion that all new work added to ancient buildings must be of as primitive and unornamental an appearance as possible, without regard to its harmony with the original building. Since publishing our illustration of the old Market House which existed at the east end of the church, we have found in Dunstan's history of the parish of Bromley St. Leonard (1862) a record of the fact that the Market House and School were removed in the year 1829. With reference to this parish of Bromley-by-Bow, it may be added that, according to some authorities, a small nunnery, which existed until the Dissolution, was established here in the time of William the Conqueror, and it is perhaps the history of this nunnery which Sir Walter Besant has mistaken for that of Bow Church. We may mention, in connexion with the restoration, that most of the new oak work, including the new choir benches, which has been introduced during the present restoration, has been carried out by the School of Handicraft, of Essex House, Mile End.

The Maison Dieu, Dover.

THE forthcoming sale of the Maison Dieu property at Dover, which covers about an acre and a half in Biggin-street, and is traversed at the rear by the River Dour, includes the old building known as "Maison Dieu." The original hospital of St. Mary was founded in the early years of the reign of Henry III., who was present at its dedication, by Hubert de Burgh, Earl of Kent, Chief Justiciary of England, and Constable of the Castle, for a master, brethren, and pilgrims. Dugdale cites letters of "inspeximus" of 2 Henry VI. confirming various grants by Henry III., and Richard III.'s grant of lands in River (near Dover) and Thanet is amongst the Harleian MSS. The hospital formed the residence of the King's Chancellor and suite when the Sovereign and Court visited Dover on going to and returning from France. Its gross annual income at the Suppression is given in Tanner's "Notitia" as amounting to 231*l*. 16s. 10d. In the Record Office is preserved a MS. inventory of the plate, goods, furniture, and cattle belonging to the hospital, taken in 26 Henry VIII., which mentions the great chamber called the "Hoostrye" (or guest-house), the little chamber, the master's house, stables, kitchen, infirmary, garner, brewhouse, bakehouse, and barns, and reckons the silver, "one with th' other," at 527½ oz., with masers and nuts 159 oz. in weight. The buildings,* which comprised a large hall with side rooms and an end chapel, measuring 132 ft. by 89 ft. (the walls 4 ft. thick, included), were converted by Henry VIII. into a victualling office for the Navy, and so continued until the Peace of 1814, the hall having been used as a brew and bake house and store rooms. The north portion was pulled down in 1831; three years later the Corporation bought the building for purposes of a town hall, sessions house, and prison; a new entrance was made beneath the south-west window, cells for seventy-five prisoners were made under the hall (as reduced to 124 ft. by 29 ft.) and the belfry tower was fitted as the Governor's residence—after the plans of Captain Boxer, R.N. The tower projecting from the south angle, is 24 ft. square at its base, and rises to 55 ft. above the present raised surface of the ground. Buck's view, 1734, shows the tracery, now lost, of the row of windows along the side that faces south-east. The adjoining Town Hall and Assembly Rooms, built at a cost of about 18,000*l*. after Burges's designs, were opened in July, 1883.

Seats in Cathedral Closes.

No complaint can, generally speaking, be made of the arrangements for visitors inside English cathedrals, though the manner in which certain parts are closed against those who desire to study architecture without the guidance of a verger is often provoking. On the other hand, it is much to be desired that seats should be placed outside cathedrals, so that those who wish to spend some time in viewing the external parts of these buildings should not be compelled to stand. In the delightful close of Peterborough Cathedral there is not a single seat to be found.

---

* Similar, in plan, to the hospitals or bede-houses of St. Augustine at Sherborne, Bishop Bubwith (1424) at Wells, St. Mary (*temp.* Henry II.) at Chichester, and William Browne (1493) at Stamford; compare also with the Domus Dei (*temp.* Henry III.) at Southampton, Holy Trinity (*temp.* Richard II.) at Arundel, and the Domus Dei, since the garrison chapel, at Portsmouth.

Those who visit York Minster are better provided for; but, in addition to the seats on the north side, it would be desirable to provide a bench or two to the west and south. The more opportunities there are given for the leisurely and comfortable view of the English cathedrals the better they will be appreciated and valued.

**The Structure of Metals.**

PROFESSOR J. A. EWING and Mr. W. Rosenhain gave last month the Bakerian Lecture to the Royal Society, the subject chosen being the crystalline structure of metals. Although nothing startlingly new was advanced, yet their microscopic researches seem to have placed it beyond doubt that no metal under any circumstances ceases to be crystalline. When the polished surface of a metal is etched and examined under a powerful microscope it is seen to consist of irregularly-shaped grains with clearly marked boundaries. Each grain is a crystal, the growth of which has been arrested by its contact with the neighbouring crystals. When the metal is bent and again microscopically examined the surface of each grain is seen to be marked with a system of parallel lines, but the lines on one crystal are not necessarily parallel to the lines on another. Professor Ewing has shown that they are slips along cleavage or guiding planes in the crystal, the effect of each slip being to develop a step on the polished face. The bending of a piece of non-elastic metal is, therefore, caused by the numerous finite slips that take place along the cleavage planes of the crystals that form the metal. Professor Ewing's researches on the structure of alloys were fruitful in valuable results. The alloy shows large grains quite different from the grains of pure metal. Each grain consists of a mixture of the two metals, one of them appearing as crystals on the face of the other. If it is strained, the structure becomes more marked, as the slips cause differences of level between the two constituents. A study of the micro-structure of alloys affords a simple explanation of their anomalous behaviour in regard to heat and electricity. If the more expansible metal exist as separate pieces within the other, then the effect of heating will be to press the two together, and thus the joints between the two will conduct electricity better, with the result of minimising the worse conductivity due to heating. It is possible even for an alloy to have a negative temperature coefficient. A simpler explanation of this puzzling phenomenon could hardly be given.

**Rous' Fire-Resisting Material.**

ON Friday, the 9th inst., some interesting experiments were conducted at Willesden Green to show the effects of a conflagration on "Rous' fire-resisting and non-conducting material." The material itself is a kind of plaster, the precise composition of which was not divulged, but which was said to be a combination of chemicals mixed with lime, and a vegetable fibre. Tungstate of soda is one of the constituents. For the purposes of the experiments a small hut had been erected; it was match-boarded externally, and in the interior the laths of the walls and ceiling had been coated with the plaster. A fierce fire was then lighted in the interior, and after a time some of the plaster, which was about ¾ in. in thickness, powdered up and exposed the laths behind. These did not immediately catch fire, however, and it was not until the fire had been lighted for an hour that any material damage was done to the little building. At the expiration of that time the laths were eaten through in places, and the external match-boarding was set alight. There was no pyrometer or other means present to enable one to judge of the temperature employed, and the net result of this experiment was that the material certainly retards the progress of a conflagration. Had the plaster been drier it is probable that it would not have powdered with such facility. In order to show that the material is a non-conductor of heat a small flat block was placed on a fire, and after some time had elapsed, and whilst still on the fire, the top of the block was found to be quite cool. It seems probable that the principal use to which this material will be put is for the covering of steam pipes and the like.

**Technical Schools, Barrow-in-Furness.**

THE contract for these schools, which were the subject of an architectural competition about eighteen months ago, has just been let for about 15,000*l.* A correspondent sends us a copy of the instructions to architects in the competition, in which it is stated that "the cost of the building is not to exceed 9,000*l.*, inclusive of architect's commission," and that the Committee "will exclude from competition any designs if the Assessor (with or without the assistance of a surveyor) should determine that their probable cost will exceed by 10 per cent. the intended outlay or the estimate of the competitor." Of course we do not know what may have happened in the interval between the competition and the actual commencement of the building; but some explanation is surely called for.

**The Paris Commemorative Chapel.**

THE architect of the chapel erected to commemorate the victims of the Paris bazaar fire has submitted his scheme for the interior decoration of the monument, in addition to the painting of the cupola by M. Maignan. According to this scheme the high altar, an erection in Louis XVI. style, will be in white marble combined with chiselled bronze heightened with gilding. Behind the altar will be a niche with a statue of the Virgin, four mètres high, in hammered copper, the model for which will be made by M. Daillion, sculptor. In front of the four piers of the dome, four black veined marble vases will be placed on pedestals. The pavement of the chapel is to be in marble in four colours —white, light grey, dark grey, and black, forming a design in keeping with the general style of the building.

**Dudley Gallery Art Society.**

THE summer exhibition of water-colours by the Dudley Gallery Art Society does not contain many works to strike one by their force and originality; the general level is very mediocre. Among works that call for observation we may note one by Mr. G. Marks, "Solitude" (247), a wooded landscape very fine in colour, and on a larger scale than the beautiful little highly-finished landscapes which he has been in the habit of exhibiting here; also in rather a different style of treatment. Mr. Albert Stevens's large drawing of "The Castle of Chillon" (228) is an excellent work of what may be called the academical school. One of the best works in the room is Mr. C. J. Adams's "Shadows and Sunny Glimmerings" (67), a kind of pastoral, very true in effect and delicate in execution. In a very different style Miss Margaret Bernard shows a fine broad sketch, rather than picture, of "Marshes, Breamore, Wilts" (75). Among others we may mention Mr. Duassut's "Wayside Pastures" (91), Mr. Coleridge's "Haytime in the Lodden Meadows" (102), Miss Nesbitt's "Low Tide, Whitby" (135), Mr. F. A. Verner's "Wimbledon Common" (210), Miss Skidmore's "Grampian Hills" (243), and Mrs. Stevens's "Hayfield, Chamounix" (293), with a riot of wild flowers in the foreground, delightful to the eye though not perhaps improving to the hay.

◆

## THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE fifteenth general meeting (business) of the Session of this Institute was held on Monday at 9, Conduit-street, W. Mr. John Slater presiding.

### *Election of Council, &c.*

The minutes having been taken as read, the report of the scrutineers appointed by the annual general meeting to direct the election of the council, standing committees, &c., for the year of office 1899-1900, was received. The following is the result of the election :—

*President.*—Mr. William Emerson.

*Vice-Presidents.*—Messrs. J. McKean Brydon; W. Milner Fawcett, M.A.Cantab., F.S.A.; H. L. Florence ; E. A. Gruning.

*Hon. Secretary.*—Mr. Alexander Graham, F.S.A.

*Members of Council.*—Messrs. F. T. Baggallay ; Thomas Blashill ; James Brooks, Past Vice-President ; J. J. Burnet, A.R.S.A. (Glasgow) ; W. D. Caröe, M.A. Cantab., F.S.A. ; T. E. Collcutt ; J. A. Gotch, F.S.A. (Kettering) ; E. T. Hall ; H. T. Hare ; E. W. Mountford ; Beresford Pite ; John Slater, B.A.Lond. ; R. Phené Spiers, F.S.A. ; H. Heathcote Statham ; Leonard Stokes ; Sir John Taylor, K.C.B. ; Paul Waterhouse, M.A. Oxon ; Aston Webb, A.R.A., F.S.A., Past Vice-President.

*Associate-Members of Council.*—Messrs. J. Sivewright Gibson ; H. V. Lanchester.

*Representatives of Allied Societies*—Messrs. D. Barclay (Glasgow Institute of Architects) ; R. Isaac Bennett (Manchester Society of Architects) ; J. Crocker (Devon and Exeter Architectural Society) ; Thomas Drew, R.H.A. (Royal Institute of the Architects of Ireland) ; Robert Evans (Nottingham Architectural Society) ; C. B. Fowler (Cardiff, South Wales, and Monmouthshire Architects Society) ; W. Glover (Northern Architectural Association) ; A. E. Sawday (Leicester and Leicestershire Society of Architects) ; J. Smith (Sheffield Society of Architects).

*Representative of the Architectural Association* (London).—Mr. G. H. Fellowes Prynne.

The following members were declared duly elected to serve on the Standing Committees for the ensuing year of office :—

*Art Standing Committee.—Fellows:* Messrs. J. Macvicar Anderson, F.R.S.E.; James Brooks ; J. M. Brydon ; W. D. Caröe, Ernest George ; H. T. Hare ; E. W. Mountford ; H. H. Statham ; Alfred Waterhouse, R.A., LL.D. ; William Young. *Associates:* Messrs. R. S. Balfour, J. Sivewright Gibson, H. V. Lanchester, A. N. Prentice, W. H. Romaine-Walker, J. W. Simpson.

*Literature Standing Committee.—Fellows:* Messrs. John Bilson ; H. L. Florence ; Alexander Graham ; B. Ingelow ; J. Tavenor Perry ; W. A. Pite ; Sydney Smirke ; R. Phené Spiers ; H. H. Statham ; Paul Waterhouse. *Associates:* Messrs. A. S. Fowler, M.A.Oxon., F.S.A. ; J. H. Jones, B.A.Lond. ; A. N. Prentice ; R. Elsey Smith ; L. Waterhouse, M.A.Cantab. ; P. S. Worthington, M.A.Oxon.

*Practice Standing Committee.—Fellows:* Messrs. T. Batterbury, S. Flint Clarkson, T. Harris, G. Hubbard, A. H. Kersey, J. Douglass Mathews, W. Hilton Nash, Beresford Pite, J. Osborne Smith, E. Woodthorpe, M.A. Oxon. *Associates:* Messrs. W. H. Atkin-Berry, C. H.

Brodie, H. Hardwicke Langston, Sydney Perks, A. W. Tanner, W. H. White.

*Science Standing Committee.*—*Fellows:* Messrs. L. Angell, M.Inst.C.E.; Delissa Joseph; H. W. Pratt; J. S. Quilter; H. D. Searles-Wood; Percival Gordon Smith; A. Saxon Snell; Lewis Solomon; W. C. Street; Benjamin Tabberer. *Associates:* Messrs. S. B. Beale; H. W. Burrows; Max Clarke; B. J. Dicksee; Matthew Garbutt, Assoc.M.Inst.C.E.; Charles Henman.

The Hon. Auditors for the past official year, Messrs. Zeph-King and Frederick William Marks, were re-elected for the ensuing year.

The following gentlemen were then elected members of the Institute as *Fellows*:—Messrs. G. F. Bodley, A.R.A., Royal Gold Medallist elect, London; E. A. Johnson, Abergavenny; G. A. Bligh Livesay, Boscombe, Bournemouth; E. A. Minty, Westminster; Andrew Murray, the Guildhall, E.C. As *Associate*:—Mr. Jasper Wager, of H.M. Office of Works. As Honorary Corresponding Member, Comte Paul de Suzor, member of the Imperial Academy of Fine Arts, St. Petersburg, correspondant of the Institute of France, &c., of St. Petersburg.

### *The Institute Premises.*

Mr. H. Hardwicke Langston then moved, and it was agreed, "That in the opinion of this meeting it is desirable to put a suitable and prominent inscription on the street front of No. 9, Conduit-street, indicating that those premises are occupied by the Royal Institute of British Architects."

### *Building By-laws in Non-Metropolitan Districts.*

The meeting proceeded to receive and consider the report of the Special Committee appointed by the Council to consider the administration of Building By-laws in Non-Metropolitan Districts. The report, which was recommended by the Council for approval and adoption, was as follows:—

"The Committee have considered the present condition of building by-laws in England outside the County of London, and their administration.

Some of the larger municipalities are governed in these respects under private Acts of Parliament, but the great majority of boroughs and urban districts have adopted by-laws under the Public Health Acts which have been confirmed by the Local Government Board, and they are for the most part founded on, though they do not absolutely follow, the model by-laws issued by that Board.

Around some of the larger centres of population there are urban districts which have obtained the sanction of the Local Government Board to building by-laws varying in several particulars from the model by-laws and from one another. This want of uniformity in districts closely adjacent causes inconvenience and irritation to building proprietors as well as to architects.

It is within the powers of rural sanitary authorities to apply for and obtain from the Local Government Board 'urban powers,' which have been freely granted. They can then adopt the whole of the model by-laws.

When adopted the by-laws become operative not only in that part of the district which is crowded, but also in its suburbs and outlying districts; and thus a rural district, often extending for miles round the large village or small town which forms its centre, has just the same building regulations as a crowded town.

It is the experience of the Committee that some of the by-laws thus introduced are not well adapted for general use throughout the country, and when applied in connexion with ordinary buildings over large areas of a purely rural character, they become oppressive.

The enforcement of unnecessary regulations in respect of matters in which the public has no practical interest seems to the Committee an improper interference with the liberty of the subject.

It gives useless trouble to local authorities.

It multiplies undesirably officials to be paid out of the rates.

It adds unreasonably to the cost of building.

It promotes monotony in design, stultifies invention, and prevents improvement.

It occasionally stops building. More particularly it discourages the erection of cottages for the labouring classes by landed proprietors on their country estates.

Recognising the necessity for such building by-laws as are proved to be essential to the safety or health of the public, and desiring that the by-laws relating to the same subject should, as far as practicable, be alike throughout the country, the Committee suggest that the model by-laws should be grouped in divisions as detailed below, in order that buildings in rural localities may be relieved from those divisions which appear inapplicable in such places. In an appendix they deal in detail with each division so far as amendment appears to them needed therein.

### *Suggested Divisions.*

A. Definition of Terms and Exempted Buildings [Model By-laws 1 and 2].

B. New Streets [3-8].

C. Space about Buildings and Area of Windows [53-58].

D. Structure of Party Walls [25-32].

E. Structure of Walls, Foundations, Roofs, and Chimneys [11-23, 33, 34, 36-52].

F. Sanitation, Preparation of Site, and Drainage [9, 10, 17, 52*a*, 60-89].

In rural districts the Committee consider that A, D, and F would suffice. It might be desirable to add B in the case of any part of a rural district likely to become urban.

Possibly E might be added, to apply only to large public buildings, warehouses, and factories of considerable height. Ordinary shops should not be regarded as other than domestic buildings.

In towns where a competent building surveyor of experience is engaged the whole of the by-laws should be in force. In such places exemptions from certain divisions of the by-laws should be made applicable to particular buildings rather than to districts. The Committee are of opinion that in no case should the exemptions extend to sanitary matters. The exemptions they suggest are set forth in the Appendix, Division A, No. 2.

It appears to the Committee that no model by-laws can be considered complete which do not include those to be enforced by Local Authorities with respect to the staircases and exits of public buildings and factories, even though authorised otherwise than under the Public Health Acts.

It is of great importance that the requirements of the Local Authorities as to the deposit of drawings should be reasonable, and that they should be explicitly stated. The Committee suggest that in all cases a block plan, with the lines and depths of drainage shown thereon, together with the nearest public roadway and adjoining premises within 100 ft. of the proposed building, should be deposited, and that, where required, plans and sections (together with elevations, if needful to explain methods of construction) should be submitted for inspection during a defined and limited time; which drawings should be then returned, stamped, if approved, or, if not approved, accompanied by a precise statements of the particulars in which the by-laws have not been complied with.

It would be of great advantage if an appeal could be provided to a technical authority as to the meaning and applicability of by-laws.

The Committee have the honour to lay this Report, with the appendix, before the Council of the Royal Institute of British Architects, and request that it may be submitted to a General Meeting.

It might be well to forward copies to the allied societies, for their consideration, before the meeting is called.*

On the report being adopted, the Committee suggest that the Institute should request the Local Government Board to receive a deputation, whose objects would be to point out to the Board the desirability of altering some of their model by-laws and arranging them in divisions, and to request the Board to take such steps as may be necessary to bring the new method of administering the by-laws before the notice of the Local Authorities.

The influence of those who are interested in building would have to be brought to bear upon the Local Authorities to urge them to give effect to the proposed measures of relief by adopting such, and such only, of the divisions of the by-laws as would be applicable to their districts or to different portions thereof.

### SYNOPSIS OF MODEL BY-LAWS AS ISSUED BY THE LOCAL GOVERNMENT BOARD.

| No. | | Division. |
|---|---|---|
| 1. | Interpretation of terms ... | See Appendix, A. |
| 2. | Exemptions ... ... ... | See Appendix, A. |
| 3-6. | New streets. *Retain* ... | B. |
| 7. | New streets ... ... ... | See Appendix, B. |
| 8. | New streets. *Retain*... ... | B. |
| 9, 10, 10*a*, 10*b*. | Sites. *Retain* | F. |
| 11, 12. | Walls. ... ... ... | See Appendix, E. |
| 13-16. | Walls. *Retain* ... ... | E. |
| 17. | Damp course ... ... ... | See Appendix, F. |
| 18, 19, 20, 21. | Walls ... ... | See Appendix, E. |
| 22, 23. | Walls. *Retain* ... ... | E. |
| 24. | Wood in external walls. *Omit.* | |
| 25-32. | Party-walls... ... ... | See Appendix, D. |
| 33, 34. | Support of timbers. *Retain.* | E. |
| 35. | Brick nogging. *Omit.* | |
| 36-51. | Chimneys, &c. *Retain.* | E. |
| 52. | Roofs. *Retain* ... ... | E. |
| 52*a*, 60*a*. | Water on roofs, &c. ... | See Appendix, F. |
| 53, 54. | Open spaces ... ... | See Appendix, C. |
| 55, 57. | Windows ... ... ... | See Appendix, C. |
| | Heights of stories. *Omit.* | |
| 56. | Ventilation under floors. *Retain.* | C. |
| 58. | Ventilation of rooms. *Retain.* | C. |
| 59. | Ventilation of public buildings. *Omit.* | |
| 60. | Subsoil. *Retain.* ... ... | F. |
| 61-64. | Drainage. *Retain.* ... | F. |
| 65. | Drainage ... ... ... | See Appendix, F. |
| 66-79. | Drainage. *Retain.* ... | F. |
| 80-85. | Ashpits. *Retain.* ... ... | F. |
| 86-89. | Cesspools. ... ... ... | See Appendix, F. |
| 91, 92. | Notices and plans... ... | See Report. |

### APPENDIX.

### *Division A.—Definitions and Exemptions. Interpretation of Terms.*

### *Model By-laws.*

No. 1.—Terms defined by the Acts under which the by-laws are made should be inserted here for general information.

'Base' of a wall carried on a bressummer should mean the course above the bressummer. See London Building Act, 1894.

'Topmost Story' should be defined to include a one-story building.

As far as possible the interpretations should accord with the London Building Act, 1894.

### *Exempted Buildings.*

No. 2.—It is undesirable that any buildings should be exempt in practice from supervision respecting sanitation and drainage; certainly not railway stations.

No 2 (*h*) (*i*) (*j*).—To be substituted for Model By-law No. 2 (*h*) (*i*) (*j*).

The following buildings to be exempted from all By-laws excepting Division F. (Sanitation, &c.).

(*h*) Any building, not being a public building or factory (or which, being a public building or factory, is one story only in height and is without any gallery), which is situated not less than 15 ft. from the boundary of the curtilage thereof.

For the purposes of this By-law two domestic buildings shall be regarded as one building provided they are separated by a party-wall in accordance with Division D.

*Note.*—This is not intended to exempt any public building or factory from By-laws regulating exits and stairs, should such By-laws be introduced.

(*i*) Any building situated with 15 ft. of the boundary of the curtilage, which is distant 15 ft. at the least from any public way and from any other building within the curtilage, and does not exceed 600 superficial feet in area nor 15 ft. in height, provided that its external or party-wall towards the boundary of the curtilage is constructed as provided for a party-wall in Division D.

($j_1$) Greenhouses if not attached to other buildings (see London Building Act).

($j_2$) Greenhouses attached to other buildings so far as regards the necessary woodwork of their sashes, skylights, doors, and frames.

### *Division B.*

No. 7 (*c*).—Suggested amendment:—He shall construct on one side at least of such street a footway not less than 6 ft. wide.

### *Division C.*

No. 53.—Omit 53 in favour of 53A.

No. 54.—Add to 54 and its provisos Section 41 London Building Act, part of Sub-Section i., modified thus:—

Where there is a basement-story directly and sufficiently lighted and ventilated, or where the basement-story is not constructed or adapted to be inhabited, or where there is no basement-story, and where the ground-story is not constructed or adapted to be inhabited, the open space required by this section may be provided above the level of the ceiling of the ground-story or a level of 16 ft. exclusive of lantern lights, measured from the level of the adjoining pavement.

Section 52 of the London Building Act should also be introduced in the following form:—

In the case of domestic buildings and stables or other dependent buildings abutting in the front upon a street and in the rear upon a mews or public way, the sufficient open space provided for the domestic building shall serve also for the stables or dependent building.

It might be desirable to introduce Section 45 London Building Act respecting 'Courts within a building.'

No. 55.—Suggested amendment: Every person . . . shall construct . . . suitable windows in such manner that effectual means of ventilation by direct communication with the open air shall be provided for every habitable room of such building.

*Note.*—It is not desirable that the heights of stories should be arbitrarily fixed by By-laws.

### *Division D.—Party-Walls.*

### *Model By-laws.*

Such parts of Nos. 19, 20, 21, and 22 as relate to party-walls, and Nos. 26, 27, 28, 29, 30, 31, and 32.

Every wall built for the separation of adjoining buildings belonging to different owners or occupied or adapted to be occupied by different persons shall be constructed of good bricks, stone, or other hard and fire-resisting material, properly bonded and solidly put together with good mortar.

Such wall shall in no part be less than 8½ in. in thickness. It may, however, be divided into two thicknesses of 4¼ in. by a flue, provided that such flue be pargetted, and has an opening into one only of the adjoining premises.

---

* Copies of this Report have been sent to the allied societies, and their opinion invited thereon, according to the suggestion of the Committee.

Such wall shall extend from the foundations or footings up to the underside of the incombustible roof covering, and shall be built or properly corbelled out to the full extent of any projecting string, eaves, or other architectural feature any part of which within 3 ft. of the party-wall is constructed of wood or other combustible material.

It shall also be carried up the full width and height of any turret, dormer, lantern light, or other erection on a roof or flat any part of which within 4 ft. of the party-wall is constructed of wood or other combustible material.

No timber shall be built into or placed in any party-wall nearer than 4½ in. to the centre line thereof, nor within 9 in. of the inside of any flue or chimney opening, nor within 7 in. of the upper surface of any hearth; nor shall any wooden plug be driven into any such wall nearer than 6 in. to the inside of any flue or chimney opening.

Such wall shall in each of the following cases be carried up above the roof or flat or gutter of the highest building adjoining thereto to such height as will give a distance of at least 15 in., measured at right angles to the slope of the roof, or above the highest part of any flat or gutter, as the case may be, and shall be properly coped and protected from water soaking into the wall:

(*a*) When either of the adjoining buildings has a roof not externally covered with slates, tiles, metal, or other incombustible material;

(*b*) When either of the adjoining buildings exceeds 30 ft. in height, measured from the lowest part of the ground floor story to the tie of the roof, or to halfway up the gable if the roof has no tie;

(*c*) When either of the adjoining buildings is intended or adapted to be used as a public building or as a warehouse, factory, or workshop.

When either of the adjoining buildings is of the class described under (*c*) and exceeds the dimensions described in (*b*), the wall shall be carried up for a distance of 36 in. above the roof, flat, or gutter, as the case may be, and shall also extend 12 in. higher and wider on each side of any turret, dormer, lantern light, or other erection on a roof or flat any part of which within 4 ft. of the party-wall is constructed of wood or other combustible material.

### *Model By-Law.—Buildings Adjacent to the Boundary of the Curtilage thereof.*

No. 25.—When the external wall of a new building is within 7 ft. 6 in. of any boundary of the curtilage other than a public road, the wall shall be built of incombustible material, and no timber or other combustible material shall be fixed beyond the face of such wall.

### *Division E.—Structure of Walls, &c.—Model By-laws.*

No. 11.—Add:—Any story in a roof, and the story immediately below the roof not being the ground story of a detached or semi-detached domestic building, may be enclosed with timber studding, not less than 4 in. thick, properly framed, covered externally with weather-tiling or plastering, and internally with plaster work covering the whole surface excepting the necessary openings. Such enclosure, when properly corbelled out, may overhang the wall below provided the soffit be plastered.

No. 18 (iii.).—Add to 18 (iii.): A pier not less in width and breadth than twice the thickness of the wall as defined for each story, and standing on a solid foundation, shall be deemed to be a return wall for the purposes of measuring the length of walls.

Nos. 19 and 20.—Omit 'and every party wall,' and add in both cases: The minimum thickness of every party wall shall be 4½ in. less than that prescribed for an external wall of corresponding height and length, but in no case less than 8½ in.

Add to 19 (not 20).—Where the wall of any domestic building, hereby required to be 13½ in. or more in thickness, is covered externally with tiles or other similar incombustible and impervious material securely fastened thereto, the said thickness may be reduced by 4½ in., provided that such reduction shall not be made on more than one story nor on any ground story, nor on any story exceeding 10 ft. in clear height.

No. 24.—Omit 24. See Sec. 55, London Building Act, 1894.

No. 35.—Omit. There is no corresponding rule in the London Building Act, 1894.

No. 52A.—Omit. See Division F, substituted By-law.

### *Division F.—Sanitation, Preparation of Site, Drainage.*

### *Model By-laws.*

No. 17.—Substitute 'floor' for 'timbers' in line 5. In the second paragraph a vertical damp-course should be substituted for the hollow wall described.

Nos. 52A and 60A.—Substitute the following:—Every person who shall erect a new building shall make suitable provision for carrying off the rain-water from the roofs, flats, gutters, and areas in such manner as not to cause dampness in any part of the walls or foundations of such building or any adjoining building.

No. 65.—It should be made to appear that this applies only to foul drains.

Nos. 86 to 89.—The provisions respecting cesspools are unpractical and unsatisfactory. The question of the disposal of sewage where no sewers are available requires reconsideration under modern conditions."

The Chairman formally moved the adoption of the report.

Mr. Lacy W. Ridge seconded the motion. He remarked that the most sanguine of them could not expect the Local Government Board to adopt the suggestions of the report bodily. Nevertheless, every point had been carefully considered. Their main principles were: That by-laws should be as much alike as possible throughout the country; and that they should not be enforced in places where the public had no interest in interfering. At the present time there was a great deal of unnecessary interference, because by-laws which were applicable to a large town were also applied in an open field. The Committee had divided the by-laws up in such a way that those only could be applied which the circumstances required.

Mr. W. Woodward said a more sensible report had never emanated from a Committee of the Institute. The paragraph about the Model By-Laws was singularly wise, as was that at the end, which pointed out the great advantage that would arise if a technical authority could be constituted to decide as to the meaning and applicability of the by-laws. He thought that such an authority could decide as to what should and should not apply to an outlying district. As to the paragraph with regard to the requirements of Local Authorities, he was glad to find that the Committee had omitted all reference to the scale of the suggested block plans. All who had dealings with the London County Council would appreciate this point. Then the Committee very wisely added, "which drawings should be then returned, stamped if approved, or if not approved accompanied by a precise statement of the particulars in which the by-laws have not been complied with." This suggestion, he hoped, would be communicated to the London County Council. Of course, they had one splendid amendment introduced into the Act of 1894—that the County Council should give its reasons for objecting to any plan. If the point suggested were pressed upon the Local Government Board he was sure the architects practising in the provinces would be the first to appreciate it.

Mr. P. Gordon Smith said the report had his entire sympathy. The whole question was full of difficulties because he foresaw that it opened up certain alterations in the principles and legislation which had hitherto guided them. The law as it stood allowed any Rural District Council to apply for urban powers, and he would remind the meeting that it would be a very grave responsibility for the Local Government Board to take upon itself if they refused to grant such powers when applied for. Any Government Department would, he thought, feel this responsibility too great to give a refusal. However that might be, the proposals in the report had a great deal to commend them to those in authority, and he would do all he could to bring them into force. There were admittedly some points that were debatable.

Mr. Ralph Nevill said that with regard to the adoption of urban powers by Rural Authorities he could not express his agreement with Mr. Gordon Smith. He always understood that the Local Government Board was specially intended to keep in order the Local Authorities to prevent them usurping too much power or misusing that which they possessed. Every one knew that unreasonable requirements were now made. For instance, the 8 ft. 6 in. height for cottages was ridiculous, and he suggested that the deputation should, when it goes up, urge the limitation of the regulation to 8 ft., and not only that, but allow the ceiling and floor to be included. It was absurd to say that 8 ft. was not amply sufficient for health. The exclusion of gables in prescribing the thickness of walls below, and the sufficiency of concrete as a footing, should also be urged.

Professor Kerr thought it very necessary that a tribunal of some sort should be constituted to deal with matters that were doubtful. Constantly difficulties arose with reference to the interpretation of the Act. In London they were driven back upon this consideration—What is the policy of the County Council?

Mr. Lacy Ridge said such questions as that of the administration of the Building Act could not be one of policy but of law.

Professor Kerr replied that admitting that that was so, it would be well to have a technical authority to clear up points as to the interpretation of the Act and by-laws. He would like a tribunal to be in a position to say that such and such was the intention of the Act. As a District Surveyor of many years' standing he had always tried to interpret the Act not on the letter of the law but on its principle.

Mr. Lacy Ridge, replying to the discussion, pointed out to Mr. Ralph Nevill that the height of rooms were not in the Model By-Laws at all, so they had no opportunity of objecting, except by a note. With reference to the suggested tribunal, he was glad that the proposal received Mr. Gordon Smith's approval. If there was a difficulty about such things in London, it was tenfold worse in the rural districts, where the by-laws were sometimes enforced without discretion, and very little knowledge. He differed from Mr. Gordon Smith as to the duty of the Local Government Board. He thought that authority ought to restrain small Local Authorities when they were assuming powers they were unfitted to carry out.

The Chairman remarked that it must be a source of great satisfaction to Mr. Lacy Ridge to find almost unanimous agreement with the conclusions to which the Committee had arrived.

The motion to adopt the report was then put and carried *nem. con.*

### *Party Structures.*

The Chairman moved the resolution passed by the Special Committee and approved by the Council, as follows: "That the Royal Institute of British Architects petition the Local Government Board to promote a Bill in Parliament to regulate the procedure in dealing with party structures in a similar manner to the London Building Act of 1894 in all parts of England where there are no Acts of Parliament dealing with such party structures."

Professor Kerr said nothing could be more useful to them as architects than that section relating to party structures. All partnership disputes were difficult and protracted, and in this case they had a partnership in a structure with the partners on either side of it. The danger was that as soon as they began to contest the ownership they got into the hands of the lawyers, from whose clutches they emerged with difficulty. He seconded the motion.

Mr. Lacy Ridge explained that this resolution was separated from the Special Committee's report because the subject it dealt with required legislation rather than departmental treatment.

Mr. Woodward suggested that a clause should be added providing for reference to a tribunal of appeal.

Mr. Lacy Ridge hoped the meeting would intrude nothing of the kind into the resolution. Such a course would only complicate the subject.

The resolution was carried unanimously.

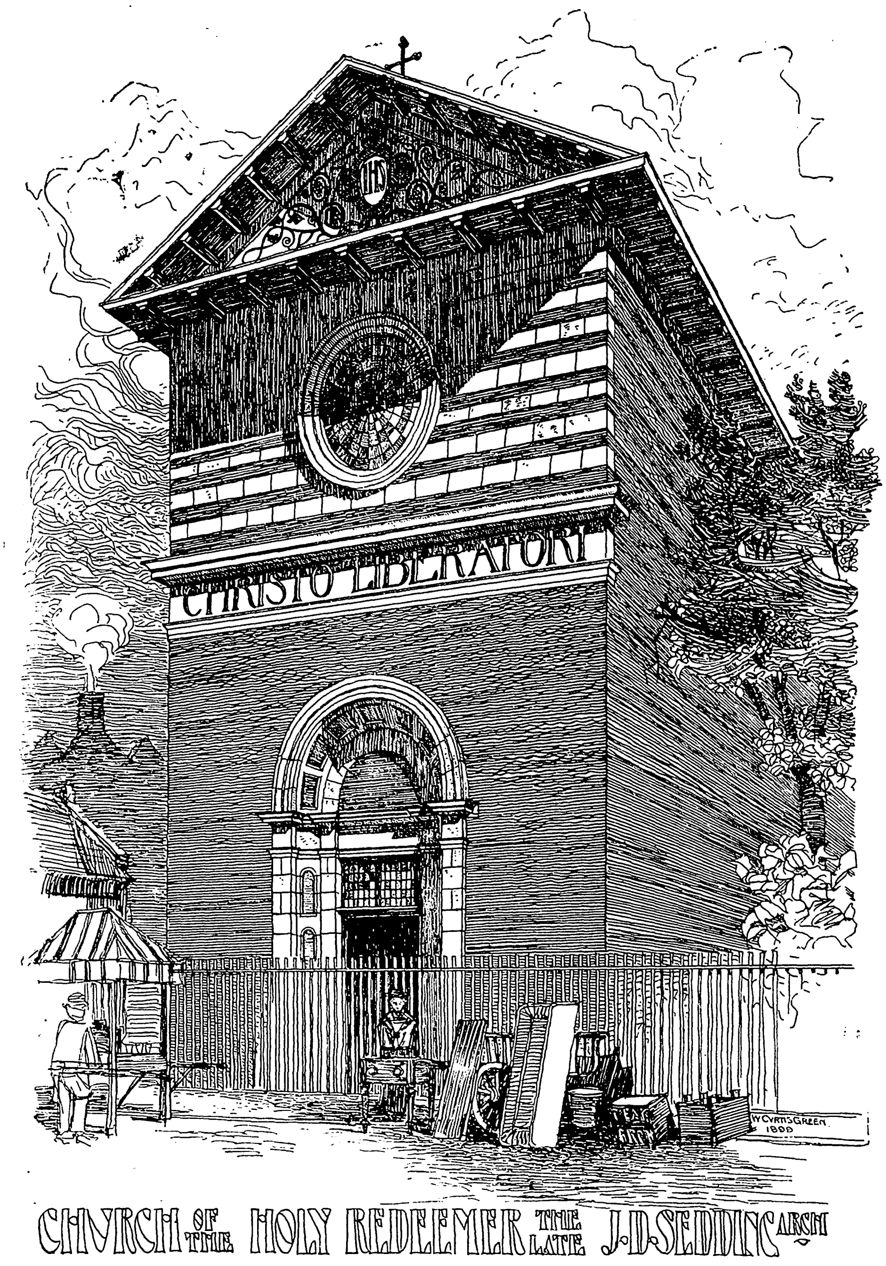
### *Congratulations to Sir Alma Tadema.*

Mr. J. M. Bryden said he had received the permission of the Chairman to move a resolution on a subject which did not appear on the agenda. Sir Alma Tadema, who had been one of those to receive from her Majesty a knighthood, had done excellent service to the Institute as a member of the Art Committee. He had, moreover, taken great interest in architecture, and he moved that a message of congratulation be forwarded to him in the name of the Institute.

Mr. E. W. Mountford seconded the motion, which was carried with acclamation.

The Chairman announced that the next meeting would be held on June 26, when the Gold Medal would be presented. The annual dinner of the Institute would be held on the following evening.

PUBLIC IMPROVEMENTS, LEICESTER.—Lieut.-Colonel A. C. Smith, R.E., a Local Government Board inspector, held an inquiry at the Town Hall, Leicester, recently, into the application of the Corporation for leave to borrow 6,185*l.* for street improvement purposes, and 830*l.* for recreation ground purposes. It was explained that the first matter dealt with the question of the High-street improvement. The proposal was to purchase the premises of 40 and 42, High-street, and a warehouse at the rear, in connexion with the widening of the street. The 830*l.* for recreation ground purposes was to defray the cost of laying out the Taylor-street recreation ground. The Borough Surveyor, Mr. E. G. Mawbey, described the character of the work.



CHRISTO LIBERATORI

CHURCH OF THE HOLY REDEEMER THE LATE J.D. SEDDING ARCH^T

*Sketches of London Street Architecture.—XXXII.*

## LONDON STREET ARCHITECTURE.—
## NO. XXXII.

THE Church of the Holy Redeemer, Clerkenwell, by the late Mr. Sedding, stands among squalid surroundings, and is built of similar bricks and roofed with common slate; the effect of the elevation consisting in the proportion and arrangement of the materials and the projecting eaves. Red facing bricks are only used to alternate with the stone bands; the lower portion of the exterior consisting of ordinary stock bricks.

A view of the interior of the church, which is treated with great originality, will be found in the *Builder* of May 7, 1887.

◆

## GLASGOW DISTRICT HALLS COMPETITION.

THE Corporation of Glasgow having resolved to provide halls suitable for the local needs of districts distant from the existing larger halls of the city, this competition is for the first of these, the districts being in Springburn and Cowlairs, which lie to the north of the city, and both have a large middle-class population. Of late years a very large amount of important work has been done by the achitectural department of the City Engineer's office; that official is now the responsible head, the post of City Architect having been allowed to remain vacant for over a dozen years. The Glasgow architects have protested long ago against this unsatisfactory arrangement, but the only concession made has been the throwing open to competition of some blocks of working-class houses. The successful competitor in the present instance is Mr. Whitie, a draughtsman in the City office, who will now start practice in his own name; the result is creditable to the municipal staff, as it is likewise satisfactory to independent architects that the responsibilities of a design can now be accredited to a person rather than a department.

The site is level, a rectangle 117 ft. by 88 ft., open on three sides, Keppoch-hill-road, Millarbank-street, and a lane; the fourth is closed in by dwelling-houses. The requirements were, halls to seat 1,200 and 400, for use independently or in conjunction, and to have connexion with a kitchen for purveying; besides necessary cloak-room accommodation and retiring-rooms for artistes and five committee-rooms, which might be independently let were also asked for. The limit of cost was put at 12,000*l.*, the successful architect was promised the work at a commission of 4 per cent. Three assessors were appointed, two elected by the Glasgow Institute of Architects, Mr. John J. Burnet, A.R.S.A, and Mr. T. L. Watson, F.R.I.B.A.; and Mr. McDonald the City Engineer, who together prepared, and in December issued, the conditions of competition; on a date shortly thereafter the assessors met, prepared to answer any questions submitted by intending competitors, and a public exhibition of the designs was promised. Drawings were sent in at the end of February, but it was May before a decision was publicly announced, and only now are the drawings exhibited. It would have been of interest also had the description accompanying each design, giving a note of cubical contents, &c., been affixed to the drawings, and so open for reference by the visitor.

Mention may be made, too, of an advertisement that appeared in the daily papers after the issue of the conditions, recommending that the two halls should be capable of being thrown into one another. It is very unfortunate if any competition has been influenced by an instruction not contained in the conditions or authorised by the assessors as a correction. Regarding the reduced commission, it should be said that protest by the Glasgow Institute of Architects was ineffectual with the majority of the Town Council, who could plead the precedent set by other municipalities, and the circumstance that the Institute, without approving either of the commission, or even of a competition, offered the services of two of its members to help in its right guidance.

The accepted design, by Mr. William B Whitie, shows both halls on the ground floor. The large one, running the long way of the site, is well proportioned, and of such dimensions that the back gallery and side balconies are of moderate size. The platform is ample and the lighting good, and there are staircases at each of the four corners. The entrance is at one end, from Millarbank-street, and herein the disposition of the cloak-rooms is the weak point in an excellent plan. They are in the basement, reached by stairs under these that lead to the gallery. Ladies and gentlemen are separated to rejoin only in the vestibule amidst the full current of new arrivals; a quite impossible arrangement. By a modification in the planning of the basement one can see how a circuit might be formed with advantage, cutting off one-half of the vestibule for arrivals, and using one stair for descent of both ladies and gentlemen would effect an improvement; but even then the arrangement would leave much to be desired. The lesser hall is just alongside the larger, connected by two pass-doors; whether used independently or conjointly, the disposition is good; its cloak-rooms are also on the basement, but, as less important, the objection is not so great in its case. The purveyor's service from kitchen is particularly good for both halls, whether used independently or together, though an entrance for goods, &c., might be had from the lane rather than from the front street; the artistes' accommodation is suitable and the committee-rooms convenient. The ground floor is raised six steps above the pavement level; the excavation necessary for the basement is consequently great, and if it is the case that the site is sandstone, two or three feet of quarrying might still be saved by raising the whole building. The elevations are but mediocre; in stone of a classic treatment that quite truthfully expresses the plan—except, perhaps, the high masking wall at the small hall, deemed necessary for balance, but without any particular interest. The end of the hall has the entrance doors double; they would be better thrown into one. Overhead is a rather insignificant great window; it is contained within quarter columns that support a broken semicircular pediment. The side of the hall is very simple, clearstory windows under a cornice; beneath all is plain wall, broken only by a range of small windows. There are no gratuitous towers or gables, the roof is exposed and has only a moderately-sized lantern, so that in the matter of cost it may be believed the conditions have been met.

The design by Messrs. Thomson & Sandilands in general size and arrangement of the great hall is not much dissimilar to the successful one, but they place their building on the long axis of the site. The hall is equally lit from both sides, and breadth is found for side corridors under the galleries. The lesser hall is placed underneath, half sunk below the pavement level: for independent use the arrangement is good, and even when both are required for one function there are advantages. The cloak-rooms are ample and well arranged; artistes'-room and committees-room are good, but the kitchen service is very bad. The architectural treatment is rather florid. Twin towers flank a gable in which is a large window that combines with the entrance underneath to form a feature. At the side—to Keppoch-hill-road—is the lesser hall entrance. Between the line of street and the building is a wide sunk area. A pen-and-ink perspective is given.

In the design by Messrs. Watson & Salmond the larger hall is an octagon of 63 ft. diameter, roofed (single) with a saucer-shaped dome, with an eye for light. At two of the sides of the octagon are recesses, one for the platform, another deeper one opposite receives a gallery that has a horseshoe balcony that runs round two-thirds of the circle. The cloak-room accommodation is good and readily accessible. The small hall is on the same floor, but somewhat pinched, and purveyor and artistes alike suffer. The excavation and bulk of building above ground are both moderate. The architectural treatment, however, is so good as to counterbalance some greater deficiencies in plan. Simple and dignified, the building could be taken for nothing but a public hall.

It says a good deal for the openness of mind shown by the assessor that three such dissimilar types should have been selected. The design by Mr. Henry Mitchell shares with the last the architectural honours of the competition. The large hall runs the length of the site, but is set back to the lane, permitting of the principal entrance being to a side of the hall—and there is much to recommend the arrangement; there is another entrance at the end. The vestibule and cloak-room accommodation is thus very simple and planned with dignity, but perhaps something less sumptuous would have sufficed. The lesser hall is placed on the upper floor, and the purveying suffers in consequence. The internal treatment of the halls and corridors is well thought-out. Externally, the hall has its side necessarily screened by the lesser hall and the committee-rooms. This frontage has the principal entrance; over a shallow area there is a colonnade; a large lantern over the great hall is also seen. To the other frontage the hall is expressed by a gable pediment but wanting the level cornice; encroaching on what would be the tympanum is a three-light window, below is a range of smaller lights to an upper corridor, and beneath is the smaller entrance. The openings generally are rusticated, the style is English Renaissance, the drawings are beautifully prepared, and include a wash perspective. Perhaps it has been on the matter of cost that this design has failed to obtain a better position in the competition.

Another type is shown by Messrs. Thos. Dykes & Robertson, where both halls are on the ground floor, but running the *breadth* of the site; the result is a shortened hall. The compensation is that ample space is formed for cloak-room—and additional ones are suggested on a mezzanine floor—and entrances for artistes, purveyor, &c., by the lane are conveniences worth much. The elevations are correct Classic if not very interesting; a fine perspective is given. No. 13 has also his halls on the ground floor, running across the site, but on the axis. The short hall here has necessitated two galleries, the upper of a rake only met with in theatres. The arrangement of cloak-rooms, &c., is particularly good, but in this case they have been got at too great a sacrifice. The elevation is of a kind resembling a typical French municipal hall, symmetrical and with heavy cornice.

Messrs. Jas. Corman & R. J. Somerside, with both halls on a level, in the large one show a gallery that encroaches over a full half of its floor area. If both halls were let at the one time, the exit and entrances would be badly arranged, and cloak-room accommodation too. The elevation shows a well-proportioned dome that emphasises the staircase, and the entrance is stately; but otherwise the use of a large Order embracing two stories for both façades is not good, as it serves equally for the hall of the story and for parts where there are really two floors.

No. 9 has a short, broad hall, and galleries that project too far over the floor area, and the cloak-rooms are not properly utilisable if both halls were independently let. The style is distinctly "free," but there are many good bits. No. 5 is noticeable for the curious way the lesser hall in its upper part is disconnected from the general design—on plan the separation is not so good as regards cloak-rooms. No. 6 has also both halls on ground floor, and broadside to the site; at the platform end is an elliptical apse; the galleries project too far, and the hall would be dark underneath; no advantage is taken on one side of a well that would afford light.

Several designs show the hall on the upper floor. No. 2 thus gets a very fine entrance vestibule, and the other accessory apartments are well provided for, but it would be a serious inconvenience to mount so high for both halls, and still higher for the gallery. Crossing the platform is a bridge connecting the ends of side galleries that, left open as shown, would surely be objectionable. The style adopted is Scotch Renaissance. No. 1 has also the hall on the upper floor, 17 ft. above the pavement; result—a building of great cubical contents, though it must be said that as, perhaps, the most simple of any in its architectural treatment, cost, perhaps, is not exceeded. It is strange to see a flat ceiling 30 ft. high and so much space run to waste in the roof. Mr. Geo. Sinclair has likewise a building of great bulk through raising his hall; the vestibule spaces ahd other apartments are too liberal. The style is a dignified Italian Renaissance.

The design of Messrs. James Salmon & Son shows the two halls alongside, with wide openings between, but what has been gained for connexion's sake is at the expense of convenience, if the halls were in use simultaneously for different purposes. The style is a modernised Scottish Baronial, well treated, and illustrated by a pen perspective. Messrs. Baptie & Bonn also give halls separated only by partitions, and so to be thrown open to one another; a double gallery is given to the great hall; a dome is the architectural feature of this design, and the façades support it well.

No. 7 more completely than any other has taken up the idea of throwing both halls into one for a great meeting, and shows considerable ingenuity with the problem. Mr. Charles McL. McDonald to a lesser degree meets the supposed demand, the small hall being connected to the large by sliding partitions; but these are under the gallery, so the union is for supper and ball-rooms, not for platform meetings, concerts, or the like. Mr. David Barclay, jun., has his halls on the ground floor, but if let independently the arrangement would be unsatisfactory. The lesser hall has a flat roof with two cupolas.

The eighteen designs submitted show a good average of ability, for the requirements of the case were not easily reconcilable; in selecting, a compromise was to be expected, and Mr. Whitie's plan and elevation has deficiencies, but on the whole the assessor's judgment approves itself.

## A NEW METHOD OF VENTILATING SEWERS.*

By Sir Charles Cameron, C.B., M.D.

The ventilating openings in the street sewers, which are now so general in almost every town in the United Kingdom, have not met with universal approval. When first used many complaints were made of the unpleasant odours emitted from them. The late Sir Robert Rawlinson was wont to say when such a complaint was made, "Put more ventilators in the sewer." No doubt the larger the number of ventilators the less the odours from any one of them. Practically the sewage of Dublin is now conveyed in sewers open to the external atmosphere. If they were altogether open it would be better than their present state of being open only at certain points. The houses opposite those points receive more than their due share of whatever comes out of the sewer, whereas if the sewer were as open as a ditch, every house would be treated alike to the emanations, if any, from it.

I am bound to say that, as a rule, there are no sensible nuisances caused by the street sewer ventilators; but there are occasional exceptions to this rule. Now and then persons complain to the Public Health Committee that the ventilators near their houses are offensive. On examination these complaints are generally found to be justifiable. Ordinary sewage generally has very little odour until it becomes stale; but now and then what may be termed exceptional sewage, having an offensive odour, flows through sewers in our streets, and it is chiefly from such sewage that the offensive emanations come through the ventilators.

The chief object in the use of ventilators is to prevent a greater pressure of the air of the sewers than that of the external atmosphere. It is assumed that the gases generated by the fermentation of the organic matter always present in sewage might cause the sewer air to acquire sufficient pressure to force the traps on the house drains connected with the sewer. I have always doubted very much whether the sewer gases could acquire a pressure sufficient to displace 2 in. or 3 in. of water. I have made many experiments in reference to the so-called pressure in the air of sewers. I have had the sewer ventilators closed on considerable lengths of sewer mains, and have inserted delicate pressure gauges in them. I never observed any pressure, except of the most trifling kind, in the air of the sewers when the ventilators were closed. I did, however, notice that in the early morning air often passed into the sewers from the streets. This descent of the air into the sewer I attributed to the insuction of air from the sewer into houses, the drains of which were untrapped or provided with defective ones. When the fires began to be lighted in the kitchens, air was drawn into the street sewers, especially in these parts of the City inhabited by the poorer classes. According to my experience, the pressure which occasionally may be observed in the sewers is sometimes caused by the wind. When a strong gale is blowing, gusts of wind enter the sewer through the ventilating opening.

The second object in ventilating sewers is to protect the workmen engaged in cleaning or repairing them. I greatly doubt whether the emanations from ordinary sewage are so abundant and dangerous as to imperil life or health. The manholes should, of course, be open for some time before the sewer is entered. Death of workmen from inhalation of sewer gases has not been infrequent, but it has been caused, not by ordinary sewage air, but by sulphuretted hydrogen set free from refuse from gas works, or from waste gases from gas engines allowed improperly to get into sewers, or from other exceptional causes.

It is worth noting, in connexion with the subject of this paper, that the sewers of one city as large as Dublin are not ventilated at all. This city is Bristol. Its sewers discharge their contents into a tidal river in which the water rises so high that for a large portion of the day the sewage cannot escape into the river. Bristol enjoys a remarkable immunity from typhoid fever, and I am informed that no injury to the health of the workmen who cleanse the unventilated sewers has taken place.

Notwithstanding the experience of Bristol, I confess that I am in favour of the ventilation of street sewers, though not by the means now generally employed. I object to the ordinary sewer openings in streets which are narrow and confined, and I have suggested another method of ventilation, which my colleague, Mr. S. Harty, City Engineer of Dublin, has approved of, and uses under certain circumstances. In order to explain my system it is necessary to say a few words in reference to the passage of gases through certain solid substances. If we take a gas, say oxygen or hydrogen, and enclose it in a vessel of metal, glass, or glazed porcelain, it will remain there for an indefinite period; but if the vessel is composed of unglazed porcelain or plaster of Paris, the gas will rapidly pass out of it. If a galvanic porous cell be connected with a glass tube, the latter filled with water, and its open end sealed in water, and a vessel of coal, or hydrogen, gas be placed over the cell, the water will be immediately expelled from the tube. This phenomenon is explained as follows:—All gases diffuse in right lines in all directions. The lighter gases diffuse more rapidly than the heavier ones, and all pass through porous materials. As coal-gas is lighter than air, it passes more rapidly into the cell than the air in the cell passes out of it, and therefore pressure is caused, as shown by the expulsion of water from the tube.

I have applied this property of the diffusion of gases through porous materials to the ventilation of sewers. Cylinders, composed of a mixture of two parts of porcelain clay and one of sulphate of lime, 18 in. in height and 6 in. in diameter, are used. Four or six are inserted in the crown of the sewer, and in a chamber resembling that used for the ordinary ventilators. The rain that enters the chamber from the street is carried into the sewer through a small siphon, and no wet can get at the cylinders.

As the cylinders allow air to pass freely through them, but effectually bar the passage of micro-organisms, there can be no greater pressure in the sewer air than in the street atmosphere. Air continuously comes out of the sewer, filtered through the cyclinders, and air as continuously enters the sewer through the porous vessel. The action of the filter on the air resembles the action of a Pasteur filter on water.

The sewer diffuser ventilator is manufactured by Messrs. Doulton, of Lambeth, London, and Burslem, Staffordshire.

The "fresh air inlets" of the house drains are often the outlets for foul air. When they are placed in the basement areas of houses they not infrequently cause an unpleasant odour. Whenever a water-closet is flushed the air in the soil pipe is forced out through the inlet into the external air. Mica valves are occasionally used at the inlets to prevent the gases from the soil escaping into the atmosphere. They are never air-tight, and soon go out of order. A better protection against the emission of foul air through the inlet would be a porous plate such as is used in the diffuser ventilator. As every precaution is usually taken to prevent even a "pin-hole" in the soil pipe, it seems contradictory that a large opening should be made in it.

---

* A paper read at a meeting of the Royal Institute of Architects of Ireland May 25 last.

In conclusion, I may state that the sewer diffuser ventilators have given satisfaction in Dublin, and have been found efficacious. They have been in use for the last two years, and, on examination, have been found to remain quite clean.

## ROYAL ARCHITECTURAL MUSEUM AND WESTMINSTER SCHOOL OF ART.

The annual general meeting of this Institution was held on Thursday last week at the Museum, Tufton-street, Dean's-yard, Westminster. Mr. J. P. Seddon, a member of the Council, took the chair in the unavoidable absence of the President, the Duke of Westminster.

On the motion of Mr. Pollen, seconded by Mr. Charles Foster Hayward, the Duke of Westminster was re-appointed President.

Mr. M. B. Adams moved, and Mr. Pain seconded, and it was agreed, that Sir Arthur Blomfield, A.R.A., be appointed a Vice-President in place of the late Mr. Walter Carew Cocks, and that the other Vice-Presidents be re-elected.

The report, which was then read by the curator, Mr. F. Ford, stated that the Council had again to record the loss of some of the oldest and staunchest supporters of the institution, notably of Mr. Walter Carew Cocks and Professor T. Hayter Lewis, F.S.A. Mr. Cocks, who was one of the Vice-Presidents, very rarely missed a Council meeting, until declining health prevented his attendance; and even then he more than once expressed a hope that he might be able to inspect the recent additions to the School of Art. Professor Lewis also was always to be relied on, and his active interest in the Museum remained unabated until he was incapacitated by illness. During the year the new class-rooms added to the Museum on the south side have been completed, furnished, and occupied, and have been found extremely useful. The results of the Examinations held in 1898 were, on the whole, very satisfactory. In 1897 the number of candidates from the Westminster School of Art who were presented in the most advanced subject, drawing from the life, was sixty-one, of whom only two failed. It was scarcely to be expected that this remarkable result could be repeated, but in 1898 there were sixty-four candidates, and again only two failed, the failures in this subject being only one in thirty, as against one in four for the Kingdom generally. It is customary for the Science and Art Department to mark special distinction in these annual examinations by the award of prizes known as "Queen's Prizes," entitling the winners to the selection of books to the value of forty shillings. Of these prizes, in 1898, no fewer than five were awarded to students of the Westminster School of Art. In the National Competition also the work sent up from this School of Art was more than usually successful. Six students obtained prizes, viz.: Albert J. Baker and Frances Drummond, book prizes for drawing from the life; Millicent J. Owen, book prize for a modelled mirror frame; Edgar G. Vernon, bronze medal for design for a fireplace; James Begg, silver medal for a modelled design for a door knocker; and Henry J. Strutt, the much-coveted prize of a gold medal, for a modelled panel or grille for a music-room. At the request of the Science and Art Department some of these works were subsequently sent with others to an exhibition at the Royal Industrial Art Museum at Budapest, and thence to Vienna and other places, and ultimately Mr. Strutt's gold medal work was purchased by the Austro-Hungarian Government. The Council feel that while these successes redound to the credit of the school, it is but fair to add a word of cordial congratulation to Mr. Mouat Loudan, Mr. J. Holgate, and Mr. F. E. E. Schenck, to whose careful and judicious teaching they are so greatly due. Notwithstanding the heavy and exceptional expenditure of the last two years, the finances of the Institution are in a satisfactory condition. But 375*l*. of the loan of 500*l*. from the Technical Education Board (L.C.C.) towards the enlargement of the School of Art remains to be paid off in three annual instalments.

On the motion of the chairman, seconded by Mr. Lee, the report and statement of accounts were received and adopted.

Mr. Aston Webb, A.R.A., then moved that the following gentlemen be appointed members of Council for the ensuing year, in addition to the President, hon. treasurer and hon. secretary, viz., the Earl of Wemyss and Sir A. Blomfield, A.R.A. (vice-presidents), Messrs. C. Foster Hayward, F. S. A. Sydney, W. Lee, W. Pain, J. Hungerford Pollen, M.A., J. P. Seddon, Aston Webb, A.R.A., and, as representatives of the London County Council, Messrs. L. H. Hayter, W. R. Lethaby, Leon, and Dr. Garnett. He also moved that the auditors, Messrs. Pain and Leake, be re-appointed. This having been agreed to,

Sir Wyke Bayliss read a paper entitled "The Bogey in the Studio: An Address to Art Students on the Questions of the Day."

On the motion of Mr. Aston Webb, seconded by Mr. Adams, a vote of thanks was accorded to Sir Wyke Bayliss.

A vote of thanks to the Chairman for presiding brought the proceedings to a close.

## ELECTRICITY AT THE ENGINEERING CONFERENCE.

Mr. Cuningham's paper on "Mechanical Traction by Electricity" was exactly the kind of communication suitable for an engineering conference, and gave rise to an interesting discussion. He pronounced most decidedly in favour of low-speed (70 revolutions) compound condensing engines and boilers of the Lancashire type, with Green's economisers. He quoted numbers, from his own experience, showing the great saving effected by economisers. In conclusion, he stated that more money could be lost on the one item of power than would pay all the other working charges. In the discussion Mr. Hammond said that he was inclined to agree with the author in his preference for low-speed plant, but Mr. Crompton spoke in favour of high-speed engines. The author's figures with regard to the saving effected by economisers were called in question. Professor Kennedy also stated that he knew cases where the cost of the power was only 10 per cent. of the total cost, and this, of course, greatly modifies some of the author's statements. Personally, it came as a surprise to us to see that there were still many electrical engineers in favour of low-speed engines.

Mr. Parshall's paper on the "Economical Transmission and Distribution of Electricity from a Distance" is a very valuable one, as it gives the opinions of a most original thinker who has also been a successful pioneer of new methods of traction in this country. In his opinion single-phase transmission has had its day. He stated that the popular system with the more progressive engineers was polyphase transmission at low frequency and a voltage of from 5,000 to 40,000, according to the distance and conditions of transmission. Of polyphase systems in work in this country, he mentioned the installations at Dublin and Middlesbrough. In addition, there are in course of construction the large installations of the Central London Railway, the London United Tramways, and the Glasgow and Metropolitan. In the subsequent discussion many other systems were recommended, and it was curious to note what very different conclusions various engineers had arrived at and how each was firmly convinced his own conclusion was the right one. Mr. T. Parker was in favour of high-tension continuous current machines and could point to numerous successful installations. Professor Kennedy thought that single-phase transmission, with rotary converters, was worthy of consideration. Dr. Edward Hopkinson, in the previous discussion, said that accumulators were most useful in traction stations. As a rule, therefore, the engineers praised the systems with which they had most to do, and perhaps this was natural. Considering, however, the large polyphase plants being put down in America at 40,000 volts, and considering also that Steinmetz's discovery, news of which has just come over from America, of a simple way of getting polyphase currents from ordinary alternators must greatly popularise this system, we are inclined to think that Mr. Parshall's conclusions are correct.

## CITY AND GUILDS OF LONDON INSTITUTE.

The exhibition of practical work executed by candidates at the Institute's technological and manual training examination is now open to the public in the north gallery of the Imperial Institute. The work is on view as it was presented to the examiners; in many of the subjects the examination is divided into three parts (such, for instance, as carpentry and joinery), then there is a paper of questions requiring written answers, specimens of finished work done during the session, and practical work set and executed in given materials in a certain time under the direct supervision of the examiners. The thoroughness of this system is producing good work, specially that done in the classes in manual training in wood and metal work for teachers in public elementary schools, some four or five hundred candidates competing in this class alone besides artisans. A feature this year is four exhibits of plasterer's work, a class but newly started, which has for its object the improvement of modern plaster work. The exhibits are not very hopeful, but the notion is a good one. Exceedingly beautiful results are obtainable in this material, and it would repay more careful study, and, indeed, reorganisation in its executive as well as artistic side. Basket work is also started for the first time, there being two divisions, one for cane and the other for willow work. The plumbers are represented by work in various stages. There are many other trades that have their special classes—millinery and lithography, photography and shoemaking, bookbinding and woven linen, mechanical drawing and house decorating, jewellery and clock making.

## *ARCHITECTURAL SOCIETIES.*

Glasgow Architectural Association.—The annual business meeting of this Association was held in the Rooms, 187, Pitt-street, on the 6th inst., the President, Mr. George S. Hill, in the chair. The business of the evening comprised the reading of the Secretary's, Treasurer's, and Librarian's reports, which were adopted, and the election of new office-bearers for the ensuing session. The following gentlemen were elected to office:—President, Mr. John Fairweather, A.R.I.B.A.; Vice-Presidents, Mr. Chas. E. Whitelaw, Mr. Wm. J. Blain; Secretaries, Mr. Alex. Wingate, Mr. Thos. Ramsay; Treasurer, Mr. Walter S. Tucker; Librarian, Mr. Andrew Rollo. General Committee: Messrs. Geo. S. Hill, A.R.I.B.A., Jas. Lochhead, A.R.I.B.A., Alex. McGibbon, A.R.I.B.A., Jas. McKissack, Alex. Davie, Wm. Vickers, Wm. S. Lukeman, and Robert J. Walker. A vote of thanks to the retiring President, Mr. Geo. S. Hill, concluded the business.

## *COMPETITIONS.*

Joint Epidemic Hospital, Arbroath.—At a meeting of the Joint Committees of the County and Burgh Local Authorities held in Arbroath Town Hall on the 7th inst. to consider the competitive plans for the new joint epidemic hospital at Arbroath, it was agreed to award the first premium to Mr. Hugh Gavin, architect, Arbroath, and to recommend that this gentleman should be appointed architect for the new buildings, which are estimated to cost about 8,000*l*. The premium for the successful design is 20*l*. The other premiums were awarded as follows:—Messrs. Dall & Arnott, Edinburgh, 15*l*.; Mr. D. M'Kerrow, Manchester, 10*l*. In all twenty-four designs were sent in, and Mr. Morham, City Architect, Edinburgh, acted as assessor.

Springburn Halls, Glasgow.—The result of the competition for the Springburn Halls, Glasgow, was as follows:—1st, Mr. Wm. B. Whitie, 196, St. Vincent-street; 2nd, Messrs. Thomson & Sandilands, 241, West George-street; 3rd, Messrs. Watson & Salmond, 231, St. Vincent-street. The assessors were Messrs. J. J. Burnet, A.R.S.A., T. L. Watson, F.R.I.B.A., A. B. McDonald, M.Inst.C.E.

Forfar County Council New Fever Hospital.—At a meeting of the Forfar County Council it was decided to approve of the recommendation of Mr. Morham, assessor, to place first the design lodged by Messrs. M'Arthy & Watson, architects, Edinburgh, for the new fever hospital. The second premium has been awarded to Mr. Alex. Cullen, architect, Glasgow, and the third to Mr. T. Martin Cappon, architect, Dundee. There were thirty-four competitive designs sent in.

## *ARCHÆOLOGICAL SOCIETIES.*

ROYAL ARCHÆOLOGICAL INSTITUTE.—At the general meeting, on the 7th inst. (Sir Henry H. Howorth, President, in the chair), Chancellor Ferguson read a long and exhaustive paper on "Consistory Courts and Consistory Places." In his preface he dealt with the various kinds of ecclesiastical courts—archiepiscopal, episcopal, archi-diaconal, decanal, dean and chapter's, prebendal and manorial courts, and other courts of peculiars. He showed the origin of these courts of peculiars, numbering nearly 300, and pointed out that they were most abundant in the wealthy dioceses of the South of England, but were few in the north, and wholly absent from the four poor Welsh dioceses. He then proceeded to deal separately with each English and Welsh diocese, showing the number of courts having jurisdiction in each, and describing the court places of the episcopal courts. The normal place for these courts is the westernmost bay of the north nave aisle, but there are many exceptions. These courts should be enclosed and furnished with a table and seats for the registrar and the proctors and others having business in the courts; while the chancellor should have a chair of state under a canopy, as at Lichfield and Norwich; of these two courts Chancellor Ferguson exhibited photographs, and also of that at Carlisle, where the chancellor has no canopy. Some courts have no furniture whatever, and have been appropriated by deans and chapters as receptacles for coals and ladders, and the like. The furniture was generally Jacobean, and so abhorrent to the correct man, who generally restored it out of existence.—Mr. Albert Hartshorne contributed a paper on "Samuel Daniel, the poet, and Anne Clifford, Countess of Pembroke, Dorset and Montgomery, his pupil." Commenting on the retirement of the poet, when at the height of his fame, from the society of his numerous distinguished, noble, and literary friends in London, seemingly at the end of 1610, when he took to a pastoral life in the remote Somerset village of Beckington, Mr. Hartshorne gave an account of the existing remains of the house which he has identified on the small estate, still called Clifford's Farm, and where Daniel died in 1619; and gave a description of the monument in Beckington Church, set up by the poet's noble pupil, Anne Clifford. With regard to this notable personage, reference was made to her struggle for years to regain the rights of which her father's unjust will had deprived her, and also to the noble uses to which she put her great fortune when, at last, it fell to her in 1643—restoring the ruined castles of her inheritance, rebuilding churches, and exercising bountiful hospitality until 1675, when she died in her eighty-seventh year. Judge Baylis, Dr. Wickham Legg, Mr. W. H. St. John Hope, and Mr. Emanuel Green took part in the discussion on these papers. A vote of congratulation was passed to the President on his appointment as a trustee of the British Museum.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—The concluding meeting of the session of this Association was held at 32, Sackville-street on the 7th inst., Mr. Thos. Blashill, Hon. Treasurer, in the chair. Mr. Hornblower exhibited a fine Roman cameo, dug up in Worship-street at a depth of 18 ft.; also some Flemish and other pottery found in Curtain-road, Shoreditch, at a depth of 8 ft., in excavating for foundations of a new factory. Mrs. Day exhibited an original description of the "First Aërial Voyage in England," by Vincent Lunardi, in 1784. Mrs. Pears contributed some notes upon a curious discovery recently made on the Scarisbrick Estate, in Martin Mere, between Southport and Rufford. This consisted of a canoe or "dug-out." The canoe is 16 ft. 6 in. over all, the greatest breadth being 4 ft., the inside width 3 ft. 9 in.; it is made out of the trunk of an oak tree. The wood having warped at the stern, a boomerang-shaped piece of wood has been used to hold it together with wooden pegs. This remedy apparently failed, and a sheet of lead of about the thickness of a sixpence was placed over the warp, and attached with pegs or nails, which from the analysis of the dust from the peg-holes, appear to have been of iron. The vessel was discovered whilst ploughing, and the obstacle to the plough was thought at first to have been a stump, but on carefully digging away the soil the canoe was unearthed. It was lying slightly on one side and tilted upwards; the position in which it was found was about 200 yds. from the old bank of the lake. Mrs. Collier read a paper "On the Châteaux and Domestic Dwellings of France in Mediæval Times" which was profusely illustrated by drawings, photographs, and engravings. A paper "On Ancient Customs" by Mr. Andrew Oliver was read by the author, and a short paper contributed by Dr. Russell Forbes in continuation of his account of the discoveries in the Forum at Rome, was read by Mr. Patrick, Hon. Sec.

WOLVERHAMPTON ARCHÆOLOGICAL SOCIETY.—The opening excursion of this Society took place on Saturday last to Prestwood Hall and Stourton Castle. Over fifty persons formed the party. Prestwood Hall was first visited, and then an inspection was made of Stourton Castle, an untenanted Tudor mansion with Georgian additions. The rooms were inspected and the grounds explored, and subsequently the President of the Society (Mr. T. G. Baker) read a paper on "The Life and Times of Reginald Pole," who was born at Stourton Castle in March, 1500.

## THE LONDON COUNTY COUNCIL.

THE London County Council reassembled on Tuesday after the Whitsuntide recess at the County Hall, Spring Gardens, Lord Welby, Chairman, presiding.

*Loans.* — On the recommendation of the Finance Committee, it was agreed to lend the St. Giles District Board 5,000*l.* for the purchase of land for the extension of offices, stoneyard, &c.; the Wandsworth District Board 10,000*l.* for a contribution towards provision of open space, and 1,100*l.* for wood paving works; the Clerkenwell Vestry 2,677*l.* for wood and granite paving works; Battersea Vestry 30,000*l.* for the purchase of two wharves, and 12,555*l.* for wood paving works; the Holborn Guardians 5,000*l.* for drainage works at the infirmary; and the London School Board 150,000*l.* for new schools.

*Factory and Workshop Acts.*—The adjourned report of the Building Act Committee on the Factory and Workshop Acts, 1878 to 1895 was then considered. The Committee's report, which was printed in our issue for April 29 last, was agreed to after the following alterations had been made:—The following words have been inserted (under II.) in the clause relating to alternative means of escape: "where more than forty persons are employed above the ground floor," so that the clause now reads:—"It may, however, be laid down as a general principle (subject to the exceptions hereafter mentioned) that where more than forty persons are employed above the ground floor, distinct and separate alternative means of escape, exclusive of windows, loop-hole doors, &c., are required from each of the upper floors, either by means of (*a*) a second staircase in the same block; (*b*) a proper staircase in another block, to which access is available on all the upper floors by proper openings in the party or division walls, or by external communication; or (*c*) open iron bridges where the blocks are not adjoining each other;" and from clause (*c*) (III., Staircases) the following words have been deleted, "and not less than three steps."

*Holborn to Strand Street and Clare Market Area.*—On the recommendation of the Improvements Committee it was agreed:

(*a*) That the estimate of 200,000*l.* submitted by the Finance Committee be approved, and that the Council do sanction the acquisition for 200,000*l.* under Part III. of the Housing of the Working Classes Act, 1890, of the portion of Reid's Brewery bounded by Clerkenwell-road, Gray's Inn-road, Portpool-lane, and Leather-lane, and shown by pink and purple colour upon the plan presented to the Improvements Committee on May 10, 1899.

(*b*) That in connexion with the rehousing of persons of the labouring class to be displaced by the formation of the proposed new street from Holborn to the Strand and the clearance of the Clare Market area, Parliamentary powers be sought in the session of 1900 to enable the Council to acquire compulsorily the land bounded by Clerkenwell-road, Leather-lane. Hatton-wall, and Hatton-garden, and shown by yellow colour upon the plan presented to the Improvements Committee on May 10, 1899.

*New Theatre at Whitechapel.*—The Theatres and Musical-halls Committee reported:—"We have considered nine drawings, seven dated 12th and two dated January 14, 1899, of a theatre which it is proposed to erect in the Whitechapel-road on the site of premises known as Wonderland, which were until last November licensed by the Council for music. The total boundary of the site of the proposed theatre is 556 ft., of which 31 ft. front to the Whitechapel-road, 155 ft. to a footway 20 ft. wide, 51 ft. to a footway 15 ft. wide, 93 ft. to a footway 10 ft. wide, and 226 ft. to buildings. The total frontage to thoroughfares of the width required by the regulations is 186 ft., whereas it should be 278 ft. To compensate for this, however, 144 ft. of frontage are given on to footways of 10 ft. and 15 ft. in width. It should, moreover, be pointed out that by the efforts made to comply with the site regulation for theatres a great improvement, which has been sanctioned by the Council, has been effected in the locality, as a footway 20 ft. in width will be formed between the Whitechapel-road and Charlotte-street. Having regard to all the circumstances of the case, we think the site should be accepted. The theatre will have seating accommodation for 1,646 people, and the regulations as to construction will be strictly adhered to."

The report was adopted.

*New Theatre at Finsbury Park.*—The same Committee recommended, and it was agreed, to approve plans of a proposed new theatre in St. Thomas's-road and Rock-street, Finsbury Park. The Committee stated:—"The site complies with the regulations, as half the total length of the boundary abuts on public thoroughfares which are of more than the required width. The theatre will have seating accommodation for 1,802 persons, and the regulations will be complied with in all respects."

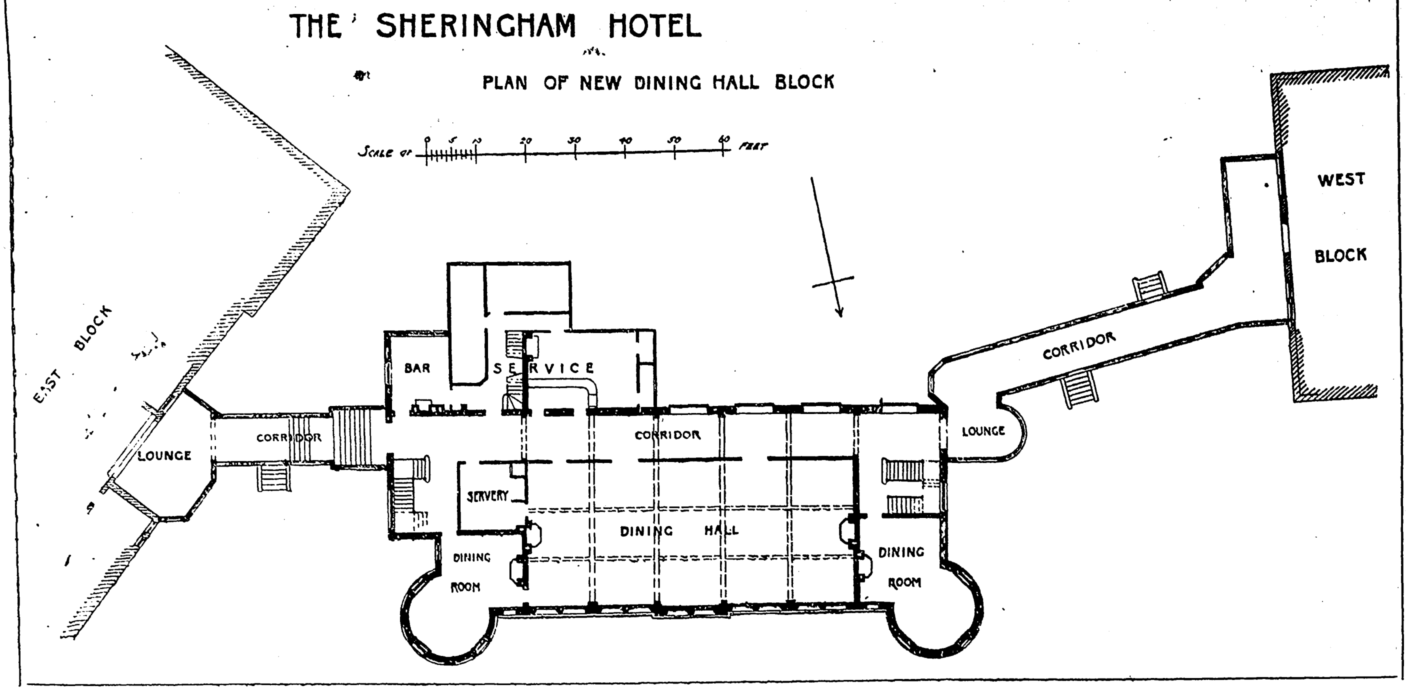
*Chimney Fires.*—The Fire Brigade Committee in reference to chimney fires recommended, and it was agreed, that the Fire Brigade Act should be amended to enable the Council to recover a penalty not exceeding 20s. as a civil debt from the occupier of premises as compensation for the loss and trouble occasioned to the Brigade in attending to extinguish the fire.

*Water Supply.*—The Water Committee presented a long report on the water supply for the Metropolis, and on their recommendation it was agreed: "That the Standing Orders be suspended so far as they would affect proposals for legislation in the Session of 1900 dealing with the Metropolitan Water Supply, and that the Water Committee be authorised, if they deem it advisable, notwithstanding the Standing Orders, to recommend application to Parliament on this subject at any time not later than November 14, 1899."

*Rotherhithe Tunnel Rehousing.*—The Bridges' Committee recommended, and it was agreed that the estimate of 4,900*l.* submitted by the Finance Committee for the purchase of certain land required in connexion with the rehousing of persons of the working classes who will be displaced by the carrying out of the Rotherhithe Tunnel scheme, be approved, and that the Bridges' Committee be authorised to purchase the land in question, in accordance with the powers given by Part III. of the Housing of the Working Classes Act, 1890.

*Art and History Committee.*—On the motion of Mr. Granville-Smith, the following was agreed to: "That it be referred to the General Purposes Committee to consider and report as to the desirability of appointing a new standing Committee to be called the 'Art and History Committee' to which all questions of an artistic, archæological, or historical character should be referred, so that the artistic claims or needs of the streets, buildings, monuments, antiquities, statues, and works of art of the metropolis may be fully considered."

*Underground Electric Tramway.*—Mr. Baker moved and it was agreed, "That it be referred to the Highways Committee to investigate and report to the Council as to the practicability of constructing a shallow underground electric tramway from Westminster (*viâ* Parliament-street, Strand, Fleet-street, and Cheapside) to the Bank, thence under Moorgate-street to the terminus of the North Metropolitan Tramways Company at Finsbury-pavement, on a similar principle to those laid under Andrassy Strasse, Budapest, and in Boston, U.S.A., provision



THE SHERINGHAM HOTEL

PLAN OF NEW DINING HALL BLOCK

being made beside the tram lines for suitable subways to contain gas and water mains, electric light mains, telephone wires, &c."

The Council adjourned shortly before seven o'clock.

◆

## Illustrations.

### EAST END, ST. LUKE'S, ENFIELD.

THE Church of St. Luke's, Clay Hill, Enfield, is now being erected and will be ready for opening on St. Luke's day of this year. The illustration, from a drawing which is hung at the Royal Academy, represents the treatment of the east end internally. The altar is of Indian teak, and the panels are painted to represent the "Adoration of the Lamb." The reredos is of stone. The centre figures are our Lord carrying the Cross. The side panels are the Agony in the Garden and the Entombment. The smaller top panels contain angels holding the emblems of the Crucifixion. The stained glass designs in the lower windows represent various passages in Christ's life on earth. The three upper lights represent Christ in majesty, the Virgin on one side and St. John the Baptist on the other, and the four Evangelists in the lower spaces of the side windows.

The whole of the paintings and stained glass are being done by Mr. N. H. J. Westlake. The architects are Messrs. James Brooks & Son.

### CAVENHAM HALL, SUFFOLK.

THIS house, which is now in course of completion, has been built on a large shooting estate in the neighbourhood of Bury St. Edmund's.

The old mansion house, situated in the lower portion of the park, is being used for housing the workmen during the erection of the new hall, which is placed some 300 yards to the south-west, on more rising ground.

On the finishing of the stable buildings and gate lodges the old hall will be entirely pulled down by the contractors, Messrs. Waring & Gillow, Limited.

The house has been built of dark red narrow bricks, averaging five courses to the foot, supplied by Messrs. Allan & Co., of Sudbury, and the stone facings are of Casterton stone; the main cornices are of deal lined with lead to form the gutters, and the roofs have been covered with tiles supplied by the Brosely Tilery Company.

Messrs. Clement Jeakes & Co. are the engineers for the heating and hot water supply, and Messrs. Tewson & Streatfield are carrying out the electric lighting. Mr. Taylor is the clerk of works.

The drawing is now on view at the Royal Academy. Mr. Andrew N. Prentice is the architect.

### MELKSHAM HOUSE, WILTS.

THIS old house as it existed before alteration was very dark and cramped. The principal front was on the north, where there is a broad lawn with fine trees and a good view of the old church.

The problem in the alteration was to admit south sun into the house without encroaching upon the existing garden. A very sunny bit of garden has been added in place of the old backyard, giving opportunity for some south windows.

The house is one of the old Wiltshire homes, and the materials and treatment largely follow the existing house. Hartham Park stone was used for window dressings, the roofs being covered with stone tiles. Messrs. G. Davies & Son, of Melksham, were the builders; the joinery being by Mr. William Carpenter of the same town.

Mr. A. C. Martin was the architect.

The drawing is exhibited at the Royal Academy.

### PROPOSED HOUSE AT LIMPSFIELD.

THE site for this house was a difficult one as it was necessary for the building line to be parallel to the road, and that elevation has a southern aspect. But from the other side of the house an exquisite view is obtained, looking over wooded hills, which made it essential for a large window to be thrown out in that direction, having another one towards the west.

The site accounts for the kitchen and drawing-room being on the same side of the house.

The materials employed are the local Limpsfield stone up to the string course, and above that the walling is of brick faced with rough-cast.

The house is to be begun almost at once.

Mr. E. T. Marriott is the architect.

The drawing is exhibited at the Royal Academy.

### THE SHERINGHAM HOTEL, NORFOLK.

THE drawing shows the central block (containing large dining-hall and private dining-rooms, &c., on the ground floor, kitchen and service apartments in the basement, and sitting and bedrooms, &c., on the upper floors) which was built to add to the accommodation of the existing hotel, then consisting of two separate establishments; hence the connecting corridors. These corridors, being 10 ft. wide and in parts 15 ft. high, with spacious windows to north and south, form, with their lounges and alcoves, agreeable resorts at any time, and are not to be regarded as mere communications.

The dining hall is 67 ft. by 29 ft. wide and 15 ft. high, and is finished with a high dado and deep Tynecastle frieze over it, with dark wood beams in the ceiling, and Tynecastle filling in between, and with oak doors, chimney-pieces, &c.

As to the design itself, it is the outcome of difficulties. The two original buildings on the site stood at most awkward angles with each other, and to put another block between them with more angles seemed to the architects to be wholly wrong. Hence, in the new building, instead of square angles, the two large circular towers were planned and the awkwardness minimised. As for the rest, the ten semi-circular coupled windows light the dining hall; the half-timber work in the upper story is added to give a connecting link in design with the east block, which is nearly all half-timber work. The west block, being merely a square red and white brick building, was but little regarded in the placing or design of the new block, which was located so as to give the best sea views for all windows.

The architects were Messrs. George J. & F. W. Skipper, of Norwich; and the general contractor Mr. George Riches, of Cromer.

### NEW HOUSE, REIGATE.

THIS is an illustration of the garden front of a house in course of erection upon the crown of the hill, and adjoining Reigate Heath, Surrey. It is built in brick, and faced with red facing brick upon a boasted stone plinth from the Selsfield quarries, near Turners Hill, similar stone being used throughout in the dressings. The upper story and roof is covered with Broseley tiles, relieved in the gables, &c., with oak half-timbering and rough cast.

The works are being executed by Messrs. Walter Holt & Sons, of Croydon, under Mr. Frederick G. Knight, architect.

◆

## *ENGINEERING SOCIETIES.*

SOCIETY OF ENGINEERS.—A visit was made by the members and associates of the Society of Engineers, on the 14th inst., to the London station and goods depot of the Great Central Railway, Marylebone. Among those present were Mr. John Corry Fell, President; Mr. Charles Mason, Vice-President; Messrs. W. W. Beaumont, A. T. Walmisley, J. W. Wilson, and Henry Adams, Past Presidents; and Mr. Perry F. Nursey, Secretary. The passenger station consists of a brick and terra-cotta building having a frontage of about 325 ft., and containing the booking-hall, waiting-rooms, refreshment-rooms, cloak-room, parcel office, and other rooms with general offices overhead on the first and second floors. These rooms are all entered from the promenade, and the booking-hall has also an entrance from the street, under a covered way which extends from the station to the hotel across the intervening roadway, which has a total width of 90 ft. The promenade has a width of 100 ft. by about 250 ft., and from it the various platforms and lines of rails extend northwards. The promenade and the platforms and rails for a length of 500 ft. are roofed over with a steel roof glazed with Mellowes' glazing, and supported upon steel stanchions. None of the spans exceed 50 ft. in width, and the total width at present roofed over for platforms and rails is 155 ft. The company, however, owns the block of land lying to the west of the station, and between it and the new street called Harewood-avenue, for future extension by which the area of platforms and rail accommodation can be made double its present size. The platforms, from the hydraulic buffer stops to the north end, are about 1,000 ft. in length. Owing to the fact that in former years the sand and gravel on the site of the building had been excavated and the space filled in with refuse, the foundations of the station had to be carried down about 25 ft. below the platform level, and a basement was therefore constructed under the whole of the building. The portion under the refreshment-rooms has been made available for kitchens, &c., in connexion with that department. The goods depôt is situate with a frontage on one of the new streets made by the company, and called Rossmore-road, and extends northwards therefrom. The main building has a length of 384 ft. by a width of 255 ft., and is constructed of brick walls with steel stanchions and girders carrying the various floors internally. There are five floors, consisting of the basement, ground, and three upper floors. The ground floor is made at rail level, but trucks can be lowered into the basement by means of hydraulic wagon hoists. The whole of the machinery of cranes, hoists, traversers, capstans, &c., is worked by hydraulic power, and the building is lighted by electricity, the power and light being both provided from the hydraulic and electric power house belonging to the company in the vicinity. There is, in addition to the goods depôt proper, a large vault area under the road approach, a considerable amount of roofing on the east, west, and sides of the building, and a large range of goods offices, with mess-rooms, &c., for the men, fronting upon Lisson-grove, where the principal entrance to the goods yard and depôt is situated. It will be noticed, in regard both to passenger and goods lines, that the level of rails has been so arranged that at each place they are at the proper level for the most convenient access to the adjoining streets.

◆

## APPLICATIONS UNDER THE LONDON BUILDING ACT, 1894.

AT the meeting of the London County Council on Tuesday the following applications under the London Building Act, 1894, were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated.

### *Formation of Streets.*

*Brixton.*—That the resolution of the Building Act Committee of March 27, 1899, acting on behalf of the Council, with regard to the application of Mr. J. Fasnacht, on behalf of Captain T. T. Jennings, R.N., be rescinded. That an order be sealed and issued to Mr. J. Fasnacht, refusing to sanction the formation or laying-out of three new streets for carriage traffic, upon the Lambeth Wyke Estate, Hackford-road, Brixton.—Agreed.

### *Lines of Frontage.*

*Dulwich.*—Wood and tile pents to the entrances of six semi-detached houses in course of erection on the west side of Calton-road, Dulwich (Mr. J. H. Cooper).—Consent.

*Fulham.*—A porch and staircase addition in front of the proposed Welsh Presbyterian Chapel on the north side of Effie-road, Fulham (Mr. E. Avern for the trustees of the chapel).—Consent.

*Fulham.*—A one-story shop at the rear of No. 569, Fulham-road, Fulham, to abut upon Harwood-road (Mr. D. Matthews for Mr. C. Thomas).—Consent.

*Hackney, North.*—The retention of a wood and iron covered way at the entrance to No. 97, Stamford-hill, Hackney, abutting on Linthorpe-road (Messrs. J. Douglass Mathews & Son for Mr. F. Tite).—Consent.

*Hammersmith.*—One-story shops on part of the forecourts of Nos. 360, 362, 364, and 366, King-street West, Hammersmith (Mr. J. Hume for Mr. M. Bartlett).—Consent.

*Kennington.*—A one-story shop upon part of the forecourt of No. 98, St. Mark's-road, Kennington, at the corner of Farmer's-road (Mr. A. E. Mullins for Mr. T. A. Jones).—Consent.

*Kennington.*—Four houses with bay-windows on the sites of Nos. 134, 136, 138, and 140, Lower Kennington-lane, Kennington (Mr. C. Barker for the Duchy of Cornwall).—Consent.

*Kensington, South.*—An open porch and projecting balconies in front of Nos. 120 and 122, Cromwell-road, South Kensington (Mr. J. Douglas).—Consent.

*Lewisham.*—That the application of Mr. W. J. Larke for an extension of the period within which the erection of one-story shops on part of the forecourts of Nos. 30, 32, 34, and 36, Loampit-hill, Lewisham, was required to be completed, be granted.—Agreed.

*Lewisham.*—Buildings on the southern side of a proposed extension of Manor Park, Lee (Mr. A. W. Osborn for Messrs. Johnson & Aldridge).—Consent.

*Lewisham.*—A bay-window to a house on the east side of Springbank-road, Hither-green, Lewisham (Mr. A. C. Baker for Mrs. N. E. Baker).—Consent.

*Lewisham.*—A church on the east side of Hither-green-lane, at the corner of Wellmeadow-road, Lewisham (Messrs. Gordon, Lowther, & Gunton for the trustees of the Hither-green Wesleyan Church).—Consent.

*Lewisham.*—One-story shops upon part of the forecourts of Nos. 143 and 145, High-street, Lewisham (Mr. J. O. Cook for Messrs. Charman & Co.).—Consent.

*Lewisham.*—A one-story addition to the laboratory at the Colfe Schools, Lewisham-hill, Lewisham, to abut upon Walerand-road (Mr. H. Porter for the Worshipful Company of Leathersellers).—Consent.

*Marylebone, West.*—Building on the east side of Abbey-road and west side of Grove End-road, St. John's-wood, on the Neville Lodge Estate (Messrs. Boehmer & Gibbs for Mr. H. Lovatt).—Consent.

*St. Pancras, East.*—A theatre on the west side of High-street, Camden-town, to abut also upon Crowndale-road and Bayham-place (Mr. W. G. R. Sprague for Messrs. Marler & Saunders).—Consent.

*Wandsworth.*†—Houses, with shops, on the western side of Garratt-lane, Wandsworth, between Fountain-road and Smallwood-road (Mr. W. C. Poole for Mr. G. F. Darby).—Consent.

*City of London.*—Oriel windows on the second and third floors in front of Nos. 55 and 56, St. Paul's Churchyard, City (Mr. E. C. Beaumont for Messrs. Jones & Co).—Refused.

*Greenwich.*†—A one-story shop upon the forecourt of No. 8, Denzil-terrace, Westcombe-hill, Greenwich (Mr. H. J. Lloyd).—Refused.

*Holborn.*†—An iron and glass conservatory and inclosure to balcony on the first floor level in front of the Inns of Court Hotel, Lincoln's-inn-fields, Holborn (Mr. E. Carritt for the Inns of Court Company).—Refused.

*Brixton.*—A one story gate-keeper's lodge upon the forecourt of a factory on the site of Nos. 139 to 141, Clapham-road, Brixton (Mr. E. T. Hall for Sir Joseph Causton & Sons, Limited).—Refused.

*Greenwich.*—A wood and tile covered way at the entrance to Fairhaven, Mycenæ-road, Blackheath (Mr. W. T. Walker for Mr. R. Young).—Refused.

*Hackney, Central.*—A workshop on the east side of Lansdowne-road, London-fields, Hackney, between Blackstone-road and Wilman-grove (Mr. W. H. Adams).—Refused.

*Hackney, Central.*—A one-story addition upon part of the forecourt of the Star Laundry, No. 8, Anton-street, Hackney (Mr. H. C. Reeves for the Star Laundry Company, Limited).—Refused.

*Hackney, North.*—Shops, with workshops over, upon the forecourt of No. 46, Northwold-road, Hackney, to abut upon Bowling-green-street (Mr. G. H. Capper for Mr. A. Jackson).—Refused.

*Hammersmith.*—A one-story station building on the site of Nos. 48, 50, and 52, Uxbridge-road, Hammersmith, at the corner of Providence-place (Sir Benjamin Baker for the Central London Railway Company).—Refused.

*Holborn.*—A one-story addition upon the forecourt of No. 29, Lincoln's Inn-fields, Holborn (Messrs. Marshall & Nelson for Mr. F. Marshall).—Refused.

*Kensington, South.*—An addition, with one-story shops, on the north side of No. 12, Sumner-place, Kensington, to an advanced line in Old Brompton-road (Mr. W. H. Collbran).—Refused.

*Lewisham.*—That Mr. H. H. Bridgman be informed that the Council is not prepared to accede to his request for consent to a one-story workshop on the east side of Arthurdon-street, Ladywell-road, Lewisham (for Mr. T. Candy).—Agreed.

*Marylebone, West.*—An iron and glass roof over a portion of Stratford-mews, St. Marylebone, in front of Nos. 2 to 7, Stratford-mews (Mr. G. Hornblower, for Messrs. Marshall and Snelgrove).—Refused.

*Norwood.*—Three blocks of residential flats upon the site of Nos. 160 to 174, Brixton-hill (Mr. E. J. Pullar for Mr. W. Wheeler).—Refused.

*Bow and Bromley.*—New church of St. Andrew, Brickfield-road, Bromley-by-Bow, Poplar, at less than the prescribed distance from the centre of Marner-street (Mr. W. D. Caröe for the Rev. J. Parry).—Consent.

*Chelsea.*†—An addition to the workshops at Nos. 37 to 49, Keppell-street, Chelsea (Messrs. Langdale, Hallett, & Co.)—Consent.

*Hampstead.*—A greenhouse on the north side of College-villas-road, Hampstead (Mr. R. Morris for Mr. F. Debenham).—Consent.

*Kensington, South.*—An addition at the rear of No. 22, Kensington-gore, South Kensington, at less than the prescribed distance from the centre of Jay-mews (Mr. F. G. Knight for Mr. L. Sterne).—Consent.

*Woolwich.*—A boiler-house on the eastern side of Harden's-lane, High-street, Woolwich (Messrs. Kirk & Randall).—Consent.

*Fulham.*—A covered playground at the William-street Schools, Hammersmith, to abut upon Cumberland-crescent (Mr. T. J. Bailey for the School Board for London).—Consent.

*Holborn.*†—An outside iron staircase at No. 51, Ormond-yard, Holborn (Mr. C. W. Patten for Mr. T. Blaxhall).—Refused.

### *Space at Rear.*

*Hammersmith.*—A modification of so much of the provisions of Part V. of the London Building Act, 1894, with regard to the extension above the diagonal line as directed to be drawn by Section 41 of that Act, so far as relates to the erection of a block of residential flats on the north side of Addison-court-gardens, Blythe-road, Hammersmith, and that the Council, in the exercise of its powers under that part of the Act, do permit the erection of such block of residential flats with an open space at the rear (Mr. R. J. Worley).—Agreed.

### *Deviations from Certified Plans.*

*Mile End.*—Certain deviations from the plans approved by the Council for the rebuilding of Nos. 16, 18, 20, 22, 24, and 26, Frimley-street, Mile End-road, Mile End Old Town, so far as relates to the proposed construction of wooden staircases and landings on the open space at the rear of such buildings (Mr. E. Jackson).—Consent.

*Lambeth, North.*—Certain deviations from the plans certified by the District Surveyor, under Section 43 of the London Building Act, 1894, so far as relates to the proposed rebuilding of the "Rising Sun" public-house on the site of Nos. 54 and 56, York-road, Lambeth, at the corner of Vine-street (Mr. R. Sawyer for Mr. R. H. Barnes).—Refused.

### *Lines of Frontage and Width of Way.*

*Bethnal Green, South-West.*†—A three-story house, with a workshop and stable at the rear, upon the site of No. 467, Bethnal Green-road, Bethnal Green, at less than the prescribed distance from the centre of Holly Bush-gardens (Mr. W. Stone for Mr. G. P. Bate).—Refused.

*Islington, North.*—A block of residential flats on the northern side of Tollington-park, Islington, to abut also upon Pine-grove (Mr. C. J. Bentley for Mr. J. C. Hill).—Refused.

*Woolwich.*—A portico and projecting steps and area inclosures to a proposed theatre on the north side of Wellington-street, Woolwich, at the corner of Lower Market-street (Mr. B. Crewe for Mr. C. Sonnes).—Refused.

### *Width of Way and Space at Rear.*

*Southwark, West.*—That the Council, in the exercise of its powers under Section 13 and Part V. of the London Building Act, 1894, do consent to and allow the erection of two blocks of dwelling-houses, adapted to be inhabited by persons of the working class, on a site on the north side of Sumner-street, Southwark, at the corner of Love-lane, at less than the prescribed distance from the respective centres of those streets, with an open space at the rear (Mr. F. Bailey for the City of London Electric Lighting Company, Limited).—Agreed.

*Rotherhithe.*—That the Council, in the exercise of its powers under Sections 13 and 41 of the London Building Act, 1894, do not consent to, nor permit of, the rebuilding of the "Dundee Arms" public-house, No. 61, Artillery-street, Rotherhithe, to abut also upon Church-street and the proposed approach road to the Tower Bridge, on the site of that house and two dwelling-houses adjoining, at less than the prescribed distance from the centre of Artillery-street and Church-street respectively, and without an open space at the rear (Mr. G. W. Thompson for Messrs. Noakes & Company, Limited).—Agreed.

### *Width of Way and Height of Buildings.*

*Bow and Bromley.*—Two buildings, to be used respectively as a bakery and warehouse, on the east side of Fawe-street, Morris-road, Bromley-by-Bow (Mr. Max Clarke for Spratts Patent, Limited).—Refused.

### *Formation of Streets.*

*Bermondsey.*—That an order be issued to Mr. C. Sheath, sanctioning the formation or laying out of a new street for carriage traffic to lead from Abbey-street to Gedling-street, Bermondsey (for the South-Eastern Railway Company). That the name Druid-street be approved for the new street.—Agreed.

*Hackney, South.*—That an order be issued to Messrs. F. Chambers & Son, sanctioning the formation or laying out of new streets for carriage traffic on the Powell estate on the north side of Millfields-road (for Mr. J. D. Powell and the trustees of the Rev. W. Powell). That the names Mildenhall-road (in continuation), Thornby-road (in continuation), and Cotesbach-road be approved for the new streets.—Agreed.

*Brixton.*†—That an order be issued to Messrs. R. B. Grantham & Son, sanctioning the formation or laying out of a new street for carriage traffic to lead from Russell-street to St. Ann's-road, Brixton (for the Ecclesiastical Commissioners).—That the name Ackworth-street be approved for the new street.—Agreed.

*Norwood and Wandsworth.*—That an order be issued to Mr. F. A. Powell, sanctioning the formation or laying out of four new streets for carriage traffic on the Highview Park Estate, Canterbury-grove, West Norwood, and in connexion therewith, the widening of a portion of Royal-crescent (for Mr. J. Wilson). That the names Broxholm-road, Ivymount-road, Minet-road, and Glenine-road, be approved for the new streets.—Agreed.

*Strand.*—That an order be issued to Messrs. Beadel, Wood, & Company, sanctioning the formation or laying out of a street for foot traffic only out of the south-west side of Drury-lane, St. Martin-in-the-Fields, and of a street for foot traffic only in continuation of Crown-court (for the Duke of Bedford). That the names Martlett-court (in continuation) and Crown-court (in continuation) be approved for the new streets.—Agreed.

*Wandsworth.*—That an order be issued to Messrs. Robertson & Barrie sanctioning the formation or laying out of two new streets for carriage traffic on the Avenue estate, Bickersteth-road, Lower Tooting. That the names Byton-road and Loubet-street be approved for the new streets.—Agreed.

### *Adaptation of Footway for Carriage Traffic, and Width of Way.*

*Fulham.*—That an order be issued to Mr. W. Elsdon refusing to sanction the adaptation of a portion of Caroline-place, Lillie-road, Fulham-road, Fulham, for carriage traffic.—Agreed.

*Fulham.*—Stables on the east side of Caroline-place, Lillie-road, Fulham (for Mr. W. Elsdon).—Refused.

### *Working Class Dwellings.*

*Hammersmith.*—That the Council do make an order as follows—Whereas Messrs. N. S. Joseph, Son & Smithem . . . Under the provisions of Section 42 of the London Building Act, 1894, delivered, on behalf of the trustees of the Guiness Trust, at the County Hall, a plan of a lodge and three blocks of intended dwelling houses, to be inhabited by persons of the working class, and proposed to be erected, not abutting upon a street, on a site on the east side of Fulham Palace-road, Hammersmith. Now the Council, in the exercise of its powers under Section 42 of the said Act, does by this order sanction the said plan. . . .—Agreed.

### *Buildings for the Supply of Electricity.*

*Lambeth, North.*—That the Council do approve of the plans submitted with the application of Mr. W. B. Pinhey for the Charing Cross Electricity Supply Corporation, Limited, for alterations and additions to buildings at the Corporation's electricity generating station, No. 85, Commercial-road, Lambeth.—Consent.

*The recommendations marked † are contrary to the views of the Local Authorities.*

## THE BUILDING TRADE DISPUTE.

IT will be remembered that the terms of settlement in the plasterers' dispute were referred to the members of the National Association of Operative Plasterers for their acceptance or rejection. The vote was declared on Saturday. It shows that 4,585 were in favour of accepting the terms and only 369 against, or more than twelve to one for acceptance. The men resumed work on Monday.

A meeting of the representatives of the unions concerned in the present dispute in the building trade was held in Manchester on the 12th inst. At the Derby conference recently the withdrawal of the lock-out in Yorkshire was made conditional on the representatives of the men agreeing to a basis for a joint conference, submitted by the editor of the *Daily News.* The men could not accept the basis, and suggested that they could only deal with the question of conciliation. The men were asked to submit their alternative proposals within a fortnight, and the meeting on the 12th was held to consider their position. The chair was occupied by Mr. Wilson, President of the Amalgamated Society of Carpenters and Joiners. The question of a basis for a conference was discussed at great length, and a basis of settlement by the appointment of a joint conciliation board to consider all questions in dispute was drawn up. This will have to be submitted to the executive committees of the various bodies represented for their special consideration, and the reports thereon will be received at another meeting to be held next Monday.

The Lancashire plasterers have, it is stated, resumed work, the masters having advanced wages from 8¼d. to 9¼d.

"TIMBER AND TIMBER STRUCTURES."—We are compelled to hold over until next week the interesting paper on "Timber and Timber Structures," recently read at Carpenters' Hall by Professor Roger Smith.

# Correspondence.

*To the Editor of* THE BUILDER.

## ENGINEERING ARCHITECTURE.

SIR,—In your paper on this subject, recently read before the Institute of Architects, you adduced Rennie's London Bridge as a good example. That Rennie's views as to such architecture were sound might be inferred from his work; but he happens to have expressed these views in such a clear and admirable way, that I think you will like to quote his words for the benefit of your readers. They are contained in a long and interesting address, which he delivered, as President, at the 1846 Annual General Meeting of the Institution of Civil Engineers, and may be found in the "Civil Engineer's Journal" for May, 1847, Vol. X., page 149. After alluding to the intimate connexion between the work of the engineer and architecture, "not merely as regards construction but in taste also," he goes on to say—

"The works of the engineer, associated as they are for the most part with the great operations of nature, should be designed and constructed so as to harmonise with them. They must strike by their mass and proportion rather than by trifling details or minutiæ of ornament, which, as a matter of taste, would be misplaced and unnecessary, and wasteful as regards expenditure. Consistently, therefore, with their first grand object of fitness for their purpose, they should be simple; and in the few instances where ornament may be necessary, it should harmonise with the structure and be sparingly used."

I think it would be difficult to put such sound sense in more excellent language.

J. D. CRACE.

⁂ Mr. Crace is right. Would that modern engineers would take Rennie's words to heart!—ED.

## THE DEVIATION OF LINE IN ANCIENT CHURCHES.

SIR,—For the twist in old churches pious and fanciful reasons have been given, which Mr. J. T. Micklethwaite disposed of in his paper on the Growth of Parish Churches, by pointing out that, as they were altered and enlarged by degrees, without going out of use, they got a little out of line quite naturally and by accident.

The new Church of Holy Trinity, Aberystwyth, bears out this theory. It is a rather long, cruciform church (155 ft.), and has been built by degrees. When the temporary east wall was taken down it was found that the new choir has a most perceptible list to the south, a fact which neither architects nor contractors had discovered.

H. A. PROTHERO.

⁂ The fact does not speak very well for the setting out of the modern building referred to. But we can hardly accept the theory as accounting for the numerous instances occurring in mediæval churches.—ED.

## BOW CHURCH RESTORATION.

SIR,—In the issue of the *Builder* of to-day you have an article relating to the above. I wish to corroborate the statement you make as to the date of the tower (1480-1490).

The upper part of the tower was destroyed by a violent storm, and in 1829 was rebuilt under the superintendence of Mr. William Ford, an architect who was a friend of mine in my young days. I have the drawings made by him for the work of the rebuilding, and which were carried out. I well remember that he told me in taking down the masonry several coins were found embedded in the joints, and they were of the reign of the seventh Henry.

WALTER A. HILLS, F.R.I.B.A.

◆

PRIMITIVE METHODIST CHURCH AND SCHOOLS, STAPLEFORD, NOTTS.—At Stapleford recently, the foundation and memorial stones of a new church and schools were laid. Mr. T. Harper, of Hyson Green, is the architect of the new buildings, and Mr. C. Moult, Stapleford, contractor, the amount of the contract being upwards of 1,600*l.*

MUNICIPAL BUILDINGS, MAINDEE, MONMOUTHSHIRE.—The formal opening of the Maindee Municipal Buildings took place recently. The buildings were constructed from the designs of Mr. R. H. Haynes, Borough Engineer, at a cost of 5,900*l.* The structure provides accommodation for the fire brigade, police, and a branch reading-room and lending library. At the rear are sheds for the use of the Works and Sanitary Committees' apparatus, together with a house for the steam roller. The space between the front buildings and the sheds has been paved, and will be used as a police parade and drill ground,

# The Student's Column.

## ARCHITECTURAL HYGIENE.

### XXII.—LIGHTING (*continued*).

GOVERNORS.—The pressure of gas is measured by the height of a column of water that it will support, stated in tenths of an inch. It is desirable to keep the pressure constant, so as to ensure uniformity in burning; any excess of pressure produces waste, and it is generally conceded that for ordinary burners seven-tenths is the best pressure. Gas is supplied to the consumer at pressures varying from 1 in. to nearly 4 in., and hence it is always advisable for the householders to have a *governor* to maintain an equal pressure irrespective of the Gas Company. Fig. 266* is a section taken through a Stott governor fixed to a service pipe or meter. It closes with an increase of pressure from the mains, and opens with a decrease; as jets are turned out, so much gas is shut off from the meter, and *vice versa.* The practice that some householders adopt of turning off the gas at the meter every night is not to be commended, because very often the taps to some of the fittings are left open, and consequently when the supply is turned on again the gas escapes from such fittings, and an accident is probable.

*Burners.*—The two burners mostly in use for ordinary domestic purpose are the "fish-tail" and the "bat-wing," which are shown in figs. 267 and 268 respectively. The "fish-tail" has a circular depressed top, from which two jets of gas are inclined to each other, and as they impinge upon themselves a broad but thin sheet of flame is produced. The "bat-wing" has a semi-circular bulb with a fine vertical slit from which issues a flat, semi-circular flame. There are many forms of the "*argand*" burner, a section of one being shown in fig. 269. The "*mantleless incandescent*" is a form of argand, but has two chimneys (see fig. 270); the air supply to the burner being brought down between the inner and the outer glass is thus warmed, and more perfect combustion is obtained. This company claim that their burner gives a candle power of 33·40, as against 16·0 of the London Argand and 9·15 of the ordinary flat flame; all three consuming 5 cubic feet of gas per hour.

The *Welsbach Incandescent Gaslight Company* created quite a revolution in lighting by their mantles, which are placed over a Bunsen burner; the only cause that prevents their more extensive use is the fragility of these mantles. If placed in positions to avoid draughts, and where there is small risk of vibration, the mantles may last six months; but in unfavourable positions they have been known to fail after a few hours. The mantle is manufactured by soaking an ordinary cotton netted hood in a solution of thoria and cevia. It is then dried and ignited, thus leaving only the metallic oxides; the mantle is then dipped in collodion, which renders it less brittle to handle. The collodion is burnt away when the mantle is placed on the burner, and the brittle network of oxides is left. Just recently, however, the Welsbach Company have introduced a new anti-vibration spring attachment, as shewn in fig. 271, to be used where the burners are subject to shock and vibration, and this seems to be successful to a large extent. A new burner has also been introduced which obviates the use of a chimney.

Messrs. Siemens invented the regenerative burner by which the air and gas is heated previously to their junction; the apparatus is, however, costly and not much in use. Messrs. W. Sugg & Company are the agents for the *Somzée-Greyson Intensified Gaslight Company*, whose system consists of using gas under a higher pressure with an incandescent mantle; the installation is, however, rather expensive. Fig. 272 shows a method of extract ventilation with a *sun light* containing many burners on a ring, and drawing out the heated vitiated air as it rises to the top of the room.

*Acetylene.*—This gas is made by adding water to calcium carbide and is now being used to some extent; the generating plant required being somewhat simple. It is much more powerful than coal-gas and does not evolve carbonic oxide. The plant for 100 lights costs between 60*l.* and 100*l.*, and it will, no doubt, be much used where the electric current is not obtainable. Experiments with this form of lighting will be watched with much interest;

---

* For the illustrations mentioned in this chapter see our previous issue, page 575.

at present the clogging of the burners and the disagreeable smell are two great disadvantages.

*The Electric Light* possesses many advantages over other illuminants, the more important being that there is no combustion, as with gas, to consume the oxygen in the air. It gives a steady light, it is easily switched on and off without striking matches; decorations are preserved and remain clean for a longer period, and it can be put in positions where gas would cause a conflagration. The definitions of the following terms which often occur may be found of use:—

*An ampère* is the unit of quantity.

*A volt* is the unit of pressure.

*A watt* is an ampère multiplied by a volt.

*An ohm* is the unit of electrical resistance.

An *electrical horse-power* is equal to 746 watts, thus a current of 7·46 ampères at 100 volts pressure is equal to one electrical horse-power.

A Board of Trade *unit* is the standard measure of output, and this consists of 1,000 watt-hours. Thus, 10 ampères of current at 100 volts pressure for one hour is equal to one Board of Trade unit.

*Production.*—Where it is possible to obtain current from a public supply station it is usually more economical to do so than to manufacture it for oneself. The Supply Company manufacture the current by means of a *Dynamo* in which rings of copper wire pass rapidly before the poles of powerful electro magnets. These rings of copper are wound on an iron core, and the whole is called an *armature*. The currents thus generated in the rings are led to a *commutator*, from which they are collected by brushes and taken away to the switchboard, and from thence to the supply mains. Currents are often generated at a very high pressure, so that the size of the copper cables may be kept as small as possible; the lower the pressure the larger must be the number of ampères, which, of course, require a larger cable. This high-pressure current, however, must not be delivered in this state; it is, of course, most dangerous to human life, therefore a *transformer* is used, which converts a small current of high pressure into a larger current at a lower pressure. Thus, 40 ampères at 2,000 volts could be transformed into 800 ampères at 100 volts, both being equal to 80,000 watts. These transformers are usually placed in suitable positions for the distribution of low pressure to the house mains. Dynamos are usually driven by steam engines when a large supply of current is required, dust refuse mixed with coal being sometimes used as fuel. Gas and oil engines are often used for small supplies. Where water-power can be obtained *turbines* should be used; they consist of vanes fitted to a wheel, which latter is made to revolve by the water impinging against the vanes. Where the water-power is small, storage batteries should be used, so that the dynamo can be worked continuously, and when lighting is required both dynamo and battery can supply the current. *Storage batteries* consist of a number of cells containing sulphuric acid, water, and lead plates. When the current is turned on a chemical change takes place until the battery is full; this will be indicated by bubbles of hydrogen gas rising in the fluid. When the battery is discharged on to the mains an exact reversal takes place and the current is given off. Batteries should be placed on racks, separated from the engine-room, as the gas they give off corrodes the machinery. They should also be used regularly, as they deteriorate if not worked. If well looked after, the deterioration should not exceed five per cent. per annum.

*Wiring.* — Two (or more) copper wires convey the current in any installation; one wire (the positive) conveying the outward current, and another the returning current (the negative) to the source of supply. These wires must be insulated for the whole of their distance, and this is accomplished by covering them with an insulating coating, such as vulcanised rubber; and the higher the pressure employed the thicker and more complete must be the covering. In fixing these insulated wires in houses, &c., many methods are in use:—

(*a*) *Wooden casing.*
(*b*) *Concentric wiring.*
(*c*) *Steel armoured insulating conduits.*

(*a*) This is the most common method, namely, to enclose them in a wooden casing as shown in fig. 273, which is either run along the external face of the plaster or is buried in the work; the latter is very objectionable on account of the difficulty of getting at any defect. The wood casing should always be covered with a solution of shellac to prevent dampness destroying the effectiveness of the installation. Wood casing should never be used where it can be avoided, and in Germany it is now prohibited, and for cheap work preference is now given to insulated conductors, which are run in sight, side by side, upon porcelain knobs. If immunity from disturbance can be assured, and if the wires are not concealed, this practice is satisfactory.

(*b*) In the better work *concentric wiring* is used. This consists of the positive copper wire being insulated with rubber or other material, and the negative wire being wound concentrically round such insulation, and the whole being enveloped in lead. An extra sheathing of steel wires may be used outside the lead envelope. In concentric wiring the negative conductor must be run to earth.

(*c*) There is no doubt, however, that the wires should, where possible, be run in a steel armoured insulating conduit. Iron piping has been extensively used, but, owing to the disastrous effects of short circuits thereon, and owing to the abrasion of the insulating surface from the wires, caused by the jagged nature of the jointing, and also owing to the liability of condensation therein, it is found that some insulating material should be coated on the inside of the pipe itself. The difference between a section of ordinary iron piping and a section of steel armoured insulating conduit is shown in figs. 274 and 275.

A *double pole* switch should be used at the point when the supply enters the house; this will allow of the negative and positive conductors being cut off from the main. A double pole fuse should be placed by this switch and on every branch service throughout the building. A fuse consists of a piece of lead or tin wire, so that if a greater current is passing along than the wire ought to carry, this fuse will melt and stop the supply. Any number of switches may be used in an installation, so that the light may be turned on and off as may be most convenient, and switches may also be placed on the fittings themselves. A switch should always be placed just inside or outside a room, so that a light may be obtained without groping about.

*Fittings.*—An endless variety of fittings of all descriptions for the incandescent light are now upon the market, from the flexible pendant (fig. 276) to the most costly and elaborate designs. The adjustable flexible pendant (see fig. 277) is a convenient form, and is much in use where a plain fitting is required. More elaborate fittings are shown in figs. 278, 279, 280, 281, and 282, the latter figure being a three-light burner fixed to the newel of a stair. In all sitting and reception rooms it is well to have a number of wall plugs, which are simply terminations to branch circuits from which current can be obtained, so that lamps may be moved to different positions in the rooms. They also allow of effective decorative lighting for receptions, may also be used for electric radiators. An effective scheme of illuminating a dinner table is to immerse the lamps in a table fountain.

Lavatories and water-closets may be lighted so that the switches are automatically turned on and off by the opening and shutting of the doors. Special water-tight fittings are sometimes used in stables to prevent the fumes arising therefrom corroding the metal parts of the lampholders. An ordinary incandescent lamp will last about 1,000 hours, and uses about 2½ watts per candle power. Higher efficiency lamps are made, but they do not last so long. The *arc* lamp (fig. 283) is used for street lighting, railway stations, public buildings, &c. The illumination is caused by the current leaping the space between two carbon pencils, which latter automatically approach each other as they are consumed. The carbons have to be renewed about every 100 hours. These lamps are made from 500-candle-power upwards, and their illuminating power is greater for the amount of current consumed than the incandescent. Technical Institutes sometimes have their studios and drawing offices lighted by illuminating the ceilings with the inverted arc lights; the reflected light thus obtained being very pleasant to work by, and all shadows are avoided.

*Cost.*—Electricity at 6d. per unit is roughly calculated to be equivalent to gas at slightly over 4s. per 1,000 cubic feet, assuming 4 watts per candle power. But it must be remembered that the electric light is more economical owing to the facility of switching it on and off, and also that gas is often left partially turned on to save the trouble of relighting. There is also a saving in the decorator's bill; books, pictures and curtains are better preserved, and the health of the occupants is more easily maintained. When it was introduced into the General Post Office in lieu of gas, 800*l.* was saved during the first year in employees' overtime, owing, so it was said, to the fact that more work could be done in the same time in the healthier atmosphere, and the sick list was also reduced by it.

The usual charges by the present day supply companies are 6d. per unit during the dark hours, and 3d. to 4d. per unit during the day time. This is done to encourage the use of electricity when the greater portion of the machinery would otherwise be idle. The Brighton Corporation charge 7d. per unit till a certain standard has been used, and then only 1½d. per unit is charged. The Westminster Electric Supply Corporation charge 6d. per unit with rebates of from 1 to 16 per cent. after a certain quantity has been used; 4d. per unit is charged for motors. In Edinburgh the cost of production is only just over 1d. per unit, and 4d. is the maximum and 3d. the minimum charged to the consumers for lighting purposes.

The cost of running the wires in casings as described previously must, of course, depend upon the different situation and circumstances of each case, but for anything over fifty lights, 1*l.* per light should cover everything except the fittings.

For country houses with between two and three hundred lamps the cost of supply ought not to exceed 120*l.* per annum where the dynamo is worked by a steam engine; the whole cost of the attendant should not be put down to the engine, as it should not take up more than half of his time. The cost of the installation and plant varies so considerably with the circumstances of each case that not even a rough estimate can be given for this.

---

## XXIII.—SANITARY INSPECTION.

This is one of the most important duties that falls to the lot of the professional man, and one that is usually underrated. And yet the health and even the lives of one's clients depend upon the care and skill exercised in the practical branch of hygiene.

In making a report upon a particular house or property a system should be adopted, so as to obviate the omission of important points that may be of vital interest to one's clients. We will, therefore, discuss these points in the following order:—

1. *Nature of Site and Soil.*
2. *Description of House and Aspect.*
3. *Nature of Materials Used.*
4. *Means of Heating and Ventilation.*
5. *Water Supply.*
6. *Sewerage and Drainage.*
7. *Plumbing and Fittings.*
8. *Lighting.*
9. *Method of Disposal of Refuse.*
10. *Alterations, Improvements, and Repairs.*

### 1. NATURE OF SITE AND SOIL.

This has been discussed in Chapter III., and we need only refer our readers to this chapter. A few trial holes may be dug to find out the character of the soil, if any doubts exist.

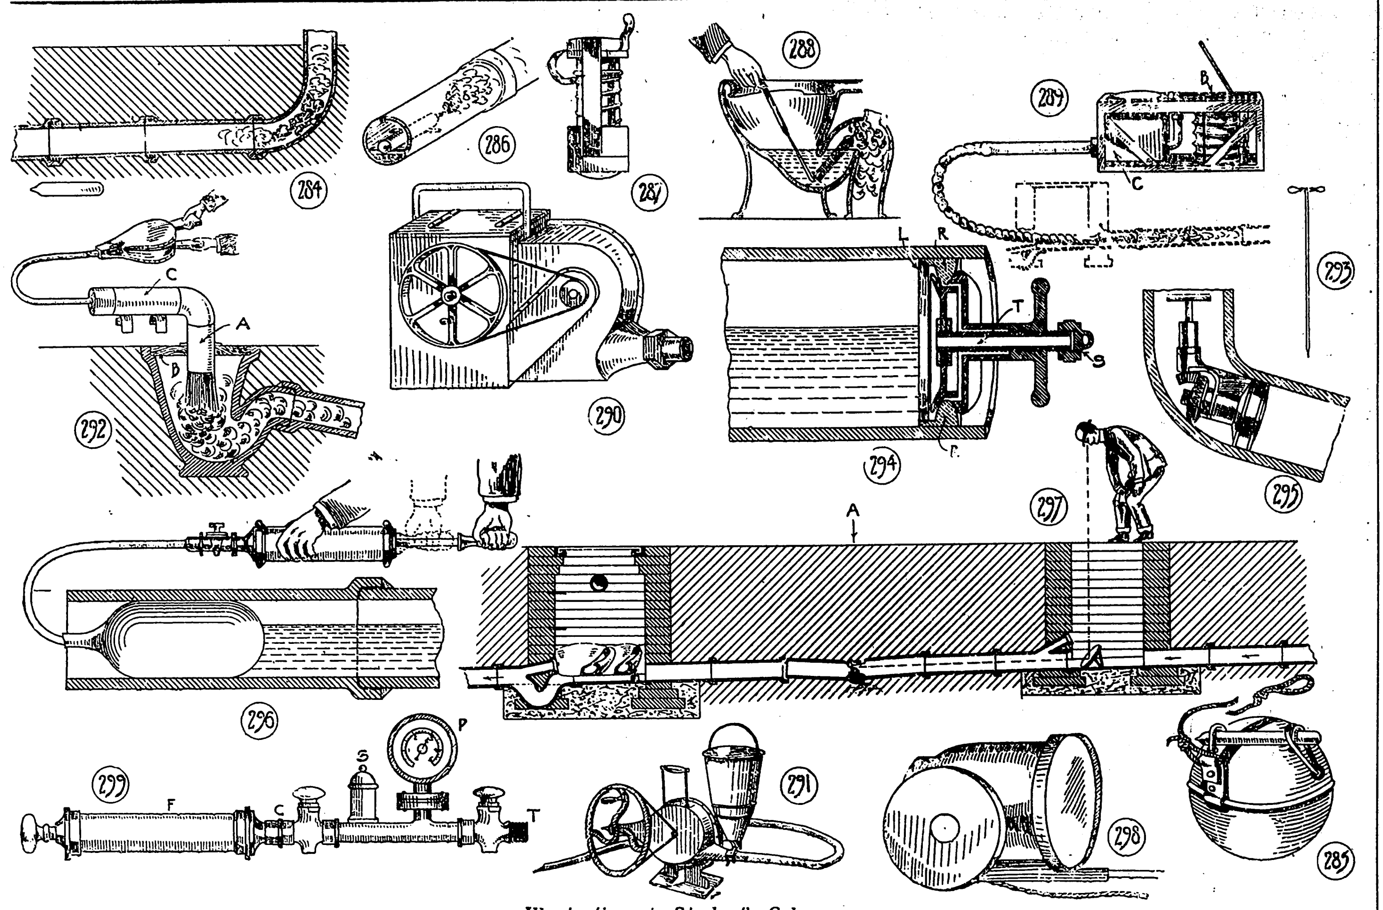
### 2. DESCRIPTION OF HOUSE AND ASPECT.

It is advisable to make a rough sketch-plan to a small scale, and to show thereon the points of the compass, so that the aspect and approximate size of the principal rooms, on the ground floor at least, may be readily discernible. Of course, the number of stories, and the number and the nature and size of the rooms in each, should be set out. The nature of the adjoining property should be also briefly noted.

### 3. NATURE OF THE MATERIALS USED.

This should be stated, and the condition and approximate age of the same should be mentioned as also their effectiveness. Particular notice should be taken of their suitability for resisting the weather and dampness.

A note should be made as to the material forming the damp-course, and its height above the ground level. In the case of basements it should be ascertained if there is a vertical damp course or dry area to keep off the water from the fabric. The internal face of such



*Illustrations to Student's Column.*

walls should be examined to see if there are any signs of dampness.

The floors should be examined to see if they are sound and not affected by dry rot; it should also be ascertained as to whether they are efficiently ventilated with air bricks, &c.

The roof should be examined and the nature of the external covering should be reported, and also as to whether felt or Willesden paper has been used between such covering and the boarding.

### 4. MEANS OF HEATING AND VENTILATION.

These should be described, and their efficiency should be tested if possible. The relation of the superficial area of window opening to the floor space may also be usefully noticed. The proximity of high buildings, &c., often effects the efficiency of the chimney flues. Fixed cowls are usually found to be more effective in curing this nuisance than revolving ones, and they have also the advantage of being less noisy.

### 5. WATER SUPPLY.

The source should be reported, and also the nature of the pipes and fittings and their suitability for the character of the water supplied. If supplied by a water company it should be ascertained as to whether the supply is constant or intermittent. If from a well or other source an examination should be made to see if there is any cause of pollution, and the structure of such well or other source should be examined.

The nature and sufficiency of the means of storage should be noted, and also the suitability of the nature of the materials used in such storage.

The filters should be examined and reported upon, and also as to whether they are supplied direct from the main supply pipe.

The information given in Chapters XIII. and XIV. should be consulted.

### 6. SEWERAGE AND DRAINAGE.

The method of the collection and disposal of the sewage should be ascertained. If this is accomplished by the Local Authority, the efficiency of the treatment and the nature thereof should be investigated. If the sewage has to be treated by the householder, a careful inspection should be made, and consideration of the system in use, and the practical working of the same, must be carefully examined. A note must also be made as to the proximity of the water-supply and its liability to pollution from this cause.

The course of the DRAINS should be traced and noted on the sketch plan, and the sufficiency of their fall and their ratio to the lengths of piping used should be marked thereon. The sizes of the various drains should be written on the plan; and it must be seen that the drains are effectively disconnected from the sewer by a proper intercepting trap.

The nature of the drain-pipes and their jointing must be ascertained, and also as to whether they are laid on a bed of concrete (and its depth) or whether imbedded in the same. The existence and efficiency of traps must be reported upon, as must also the proper inlet and outlet ventilation of the whole system. The means of access should be shown on the plan and the efficiency of the whole system must be tested.

The following are the tests that may be applied:—

*a. Olfactory test.*
*b. Smoke test.*
*c. Hydraulic test.*
*d. Pneumatic.*
*e. Mirror.*

*a.* The *olfactory* test is much used in testing existing drainage. It should be applied as follows:—

A tablespoonful of crude oil of peppermint or other chemical with a pungent odour should be placed in the highest water-closet, and a bucket of very hot water should be used to wash it through the trap. The assistant doing this part of the work should lock himself in and put a damp cloth at the bottom of the door, so as to avoid all risk of the smell penetrating into the rest of the house. He should remain therein until the test is complete, otherwise he may carry the smell about the premises. If the smell makes itself evident in the house or along the course of the drain outside, it, of course, indicates a defect in the drainage, which may be roughly traced to its source. All ventilating shafts, pipes, inlets, &c., should be closed by means of a damp cloth or clay. This test may also be repeated in the lower water-closets, so as to further test the traps, pipes, and fittings. A gulley outside the premises may also be used to test the earthenware drains.

The *Banner* drain grenade or ferret is often used instead of the essential oils for the olfactory test. Fig. 284 shows this useful appliance. It is manufactured of thin glass, and is charged with pungent and volatile chemicals. It breaks on being dropped into the trap, and there is consequently less risk of an ineffective test, as but little or no smell should be felt in the apartment if the grenade is well washed through the pipe.

Another method of using this grenade is shown in fig. 285. A grenade is placed under the staples, which is then made secure by stretching the rubber band over the grenade beyond the first staple.

When the line is jerked it will release a lever and bring it in contact with the grenade, which will be broken to pieces.

(*b.*) The *smoke* test is very often found to be the most convenient to use, and since the introduction of smoke machines it is considered by some to be a very fair test for drains that have not been recently laid. The simplest form of smoke test is accomplished by the *rocket*, which is illustrated in fig. 286, and it will be seen that it consists of a cylinder about 7 in. long by 2 in. in diameter, with a fuse at one end. When the latter is ignited a dense volume of smoke with a pungent odour is emitted and forced up the drain. Great care must be taken in applying the rocket in the manhole, as we have often seen men rendered unconscious through the fumes of the smoke. The strips of wood shown on the case are turned at right angles to it, and keep it off the invert of the pipe.

Fig. 287 shows a useful little invention. It is *Remp's Patent Drain Tester.* The cover is removed and the "tester" is lowered into the water-closet trap on a string, which should be secured. Hot water is then thrown down the fitting so as to wash the appliance into the drain. A strong odour and a large volume of smoke is the result, and defects can be readily detected thereby. The tester should be pulled up on the string, after the experiment, and examined to see that the contents have been discharged.

*Burnett & Groom's Tester* is shown in fig. 288. The trap should be flushed, and then the tester should be ignited and passed through the water by means of the loose handle, and should be left there for about ten minutes. The drain is thus charged with a dense and pungent smoke.

Of the *Smoke Machines*, fig. 289 represents the "Eclipse Smoke Generator" of Messrs. Burns & Baillie. It is composed (B) of a double-actioned bellows covered with prepared leather and a copper cylinder (C), which constitutes the fire-box. The latter is surrounded with a water-jacket. A copper "float" is placed over the cylinder, and an air-tight joint is thus formed. A specially-prepared india-rubber tube, made to withstand the heat, is connected with the outlet of the machine. By working the bellows the smoke is forced into the drain; all openings, such as ventilation-pipes, being, of course, plugged. The smoke is generated by burning "touch paper" or cotton waste, &c.

Fig. 290 shows the *Tyndale Asphyxiator*, which is compact and convenient, and possesses the advantage of not having any small parts likely to get lost.

A simple smoke machine called the "Asphyxiator" is shown in fig. 291.

The smoke is obtained by lighting sulphur, tar-paper, &c., in the bucket, which is provided with a cover, and by turning the wheels a fan is set in rapid motion causing the smoke to be driven into the drain by an india-rubber tubing.

Another form of smoke machine is shown in fig. 292. To test the drain you must remove the water seal from the trap, insert the hose piece A through a piece of board B, and make tight the joints with clay; a smoke cartridge is then placed in the cylinder C; and by lighting the end of the cartridge and blowing gently with the bellows a dense volume of smoke is ejected into the drain.

Fig. 293 illustrates a probing iron, which is used along the course of the drain being tested by the olfactory or smoke tests, which assists the smell or smoke to make itself apparent.

(*c*) The *Hydraulic Test* should invariably be insisted upon for all new drains, and, of course, no drain can be said to be in a really safe and satisfactory condition unless it is capable of withstanding this test.

The lower end of the length of drain-pipe to be tested should be plugged. This may be accomplished by means of a drain-plug or bag.

Fig. 294 shows a section of the *Addison patent plug*, which is a very convenient form. The rubber ring (RR) has a large surface to press against the inside of the pipe, and the lip (L) tends to make the joint very secure. The stopper is fitted with an inner tube (T) which is sealed by a screw-cap (S), which may be used to allow the water to escape after the test. This latter is also useful for filling the drain at the upper end, and by attaching a piece of india-rubber tubing the necessary head of water may be obtained. Fig. 295 represents Messrs. Burn's "Angle Plug," which is useful for stopping drains at bends, &c.

Fig. 296 represents *Jones's patent pipe stopper*. As will be seen, it consists of an india-rubber bag which is inflated by a small pump, until it entirely fills up the aperture. By turning the tap the air is released from the bag, and the latter collapses and may be drawn out.

When using the hydraulic test the lengths of drains should be tested between the various manholes; but where no such conveniences exist of course the drain must be taken up at various points, and plugged as previously described. The level of the water must be carefully noted, and any subsidence after a period of two or three hours indicates that there must be a defect somewhere in the length of pipe tested, or it may be that *tested* drain pipes have not been used, and that water exudes through the pores of the pipes.

(*e*) The *mirror test* is very useful for discovering sagged joints, &c., and localising them. Fig. 297 illustrates its application; a lighted candle is placed one end of the drain in the inspection chamber, and the mirror is placed at an angle at the other. By standing over the mirror the interior of the pipe is viewed, and any defect may be noted, and the number of the defective joint from either end should be written down in the note-book. In the example shown it will be noticed that two drain pipes have sagged, and in consequence have forced off the collar and spigot end of the pipe. This would be written in the note-book as the third and fourth drain pipe, and the earth would be excavated at A. The damage was evidently caused by no bed of concrete being placed under the pipes. It will be noticed that the sewage has oozed through the defective pipes and polluted the soil. *Doughty's Inspection Lantern* is shown in fig. 298, and it consists of a small carriage to which is attached an electric lamp. An automatic reflector is used in connexion therewith, and any irregularities in the drain may thus be detected. This instrument can be used for drains that are not in a straight line from point to point.

(*d*) *The pneumatic test* is now advocated by many, but it is not frequently used in practice. It consists of pumping air into the drains and their connexions by means of a pump or other mechanism. It may be applied by means of the *Eclipse Smoke Generator* shown in fig. 289. All openings to the drain must of course be plugged up, and then the bellows are put in motion. If after a few strokes the copper float rises and remains stationary it is clear that the drains are in good order. If otherwise it is evident that a leak exists, and its seriousness depends on the rapidity with which the float sinks. This apparatus is now fitted with an arrangement by which the pressure applied may be regulated. The *Jensen* pneumatic machine is shown in fig. 299. F is the force pump, P is the pressure gauge, and S is the safety valve. The pump is screwed on to the cock C, and the cock T is attached to the tube passing through the plug or bag. The safety valve is set at the pressure required and the pump is then worked, any excess over the required pressure being liberated through the safety valve. The cock C is then closed, and any leakage will be apparent on the pressure gauge.

### 7. Plumbing and Fittings.

We have discussed their construction and ventilation, &c., in Chapters VIII., IX., and X. The importance of the careful examination of these can scarcely be overestimated. In the first place, see if all fittings are efficiently trapped, whether anti-siphonage pipes have been used, and whether they are carried up above the topmost fitting in the down pipe. Note whether the pipes are in such positions as to be liable to be affected by frost. See that the soil pipe at the highest point from the sewer is carried up well above the roof and away from all window openings, &c.

The plumbing and connexions of fittings may be tested by the olfactory or smoke test, as before described. The hydraulic test is generally considered to be unfairly severe, more especially if the pipes are of any great height, as, of course, the pressure is very great.

The fittings should be examined to see that they are effective. As a rule, the simpler they are, the more efficient is their action. A good means of testing the self-cleansing properties of an apparatus is to cover the inside with lampblack, a few pieces of paper being dropped on to it in different places, the removal of which on flushing can be readily observed. When the fitting is flushed, the basin should be left perfectly clean.

Some of the water companies refuse to allow water-waste preventers of a greater capacity than two gallons to be used. In these cases we have found that a notice conspicuously placed near the fitting requesting the user to flush both *before* and after using conduces to the cleanliness of the fitting and the adjoining pipes. It has also been known to cause the water companies to consider whether it would not be more economical to have a three-gallon flush instead of the twofold two-gallon discharge.

Be certain that the smoke *does* come out of the top of the soil pipe, more especially if the latter be of iron, as we have often found that the interior is blocked up with oxide of iron. It may also have a sag or other defect which contains sufficient liquid to prevent the flush efficiently performing its work.

### 8. Lighting.

If gas is the lighting medium, it is well to employ a *gas escape detector* such as is made by Messrs. James Stott & Co. This is a governor attached to the gas service near the meter, to use as a detector. The taps should all be turned off. The main cock is then turned on, and the movement of the brass spindle is observed. When the spindle has risen the main cock is turned off. If the spindle remains in position it indicates that the work is in a satisfactory condition; if, however, it falls there must be a leak somewhere in the system. This detector also acts as a pressure regulator, and it is claimed that from 10 to 40 per cent. is saved in the consumption of the gas.

If *electricity* is the source of lighting, make a note as to the means employed of conducting the current. Of course, the best means is that of the armoured conduit mentioned in Chapter XXII. The wiring should also be tested to see if there is any leakage.

### 9. Method of Disposal of Refuse.

This should be mentioned in your report, with a note as to who collects the refuse and how often this occurs. The means of storage should be noted, and also the suitability of the construction of such receptacle. Also examine the kitchen range to see whether a firebox is provided to burn the garbage and vegetable matter.

### 10. Alterations, Improvements, and Repairs.

This portion of the report should give an epitome of the work required to be done. The same method should be observed as in the inspection itself, so that both portions of the report may be readily compared by looking at the distinctive numbers of each subdivision. An estimate of the cost may also be added. We now give two examples to illustrate the methods that we have enunciated.

## *GENERAL BUILDING NEWS.*

St. Colman's Cathedral, Queenstown, Ireland.—The work which is being carried out at this cathedral is being rapidly pushed forward. The architect is Mr. G. C. Ashlin, and the following are some of the contractors:—Messrs. Creedon, the groined ceilings of the nave and transepts, cleaning of the walls, and certain carving work, which they have sub-let to Mr. O'Connell, sculptor, of Cork; Messrs. Sharpe & Emery, of Dublin, the groining of the aisles and polishing the marble columns that support the nave arcade; Mr. Smyth, sculptor, Dublin, for marble and sculpture work; Mr. J. C. Edwards, Ruabon, ceramic mosaics; and the Wood-Block Paving Company, of London, for the floors of nave, aisles and transepts. The stained glass is being carried out by Messrs. Hardman, of Birmingham, and Mayer, of Munich. New revetment walls are being erected by Mr. J. J. Coffey, of Midleton.

Chapel and Schools, St. Ives, Cornwall.—A new chapel and Sunday-schools have just been opened in Bedford-street, St. Ives. The architect was Mr. J. W. Firth, of Oldham, and the builder was Mr. J. R. Sandry, of St. Ives.

Free Church, Oldbury.—The foundation stones of the new Providence Church at Churchbridge, Oldbury, were laid on the 5th inst. Messrs. Wood & Kendrick, of Birmingham, are the architects, and the builder is Mr. J. Dallow.

Wesleyan Mission Hall, Hasland, Chesterfield.—On the 7th inst. the foundation stones of a Wesleyan Mission Hall were laid at Hasland. The first floor will be devoted to school and class-rooms, and the second will consist of an assembly-room, with a seating capacity for 350. The architect is Mr. Cecil Jackson, Chesterfield, and the contractor, Mr. Peck.

Wesleyan Church, Sheffield.—On the 8th inst. the foundation stones were laid of a new Wesleyan chapel, to be erected at the corner of Stafford-road and Fitzwalter-road, in the Park. The new buildings consist of a church with two vestries, a church parlour, and a schoolroom with seven class-rooms. The entire structure will be of stone. The church is cruciform in plan, measuring 97 ft. interior extreme length, including chancel, 41 ft. 6 in. wide across the nave, and 59 ft. 6 in. wide across the transepts. It has an end gallery only. The church will seat 640 adults, or a mixed congregation of 850 persons. At the corner facing the junction of the roads is the tower, terminating with a spire 124 ft. high. The front of the church has three doorways, leading to the ground floor and gallery, and the centre doorway has over it a four-light traceried window. The schoolroom is built on the central hall plan, with class-rooms around it, some of them opening into the hall. The length of the room inside is 50 ft. by 29 ft. wide. The class-rooms are of varying sizes, there being two large ones for adult classes, and one large one for infants. The others are smaller. Accommodation is provided for 500 scholars. The architect is Mr. John Wills, Derby, and the builder is Mr. James Fidler, of Eckington.

Restoration of Parish Church, Edlingham, Northumberland.—The parish church of Edlingham is being restored from the plans of Messrs. Plummer & Burrell, of Newcastle-on-Tyne. The cost will be about 1,000*l*.

College Chapel, Drumcondra, Dublin.—The new chapel for St. Patrick's Training College, Drumcondra, was opened on the 11th inst. The chapel is built of red bricks with Portland stone dressings, and is 85 ft. long by 28 ft. broad and 36 ft. high. It is lighted by electricity. Mr. James Donovan, of Dublin, was the builder, and the architect was Mr G. C. Ashlin, also of Dublin.

Enlargement of Christ Church, Mountsorrel, Leicestershire.—The enlarged chancel and vestry, new organ, reredos, choir stalls and pulpit were dedicated recently. The chancel has been lengthened to 22 ft. to accommodate the choir and organ. A reredos of oak has been placed at the east end. The organ was built by Messrs. S. Taylors, of Leicester, and the choir stalls were executed by Mr. J. Dilks, of Mountsorrel. The pulpit is of old oak from the church at Spondon, Derby. The contractors for the chancel, organ-chamber, and reredos were Messrs. Scurr, Jowett, & Co., Barrow-on-Soar, and the architects were Messrs. Goddard & Co., Leicester.

Sunday Schools, Boston, Lincolnshire.—The foundation stone of the new Sunday schools which are being erected in connexion with the Zion Chapel at Boston, were laid on the 8th inst. The schools are being erected by Mr. Bradley, of Langrick, from plans by Mr. Talbot, of Batley.

SCHOOLS, ARUNDEL.—On the 8th inst. the foundation stone of new day schools at Arundel was laid. The architect is Mr. Gerald Horsley, of London.

DENTAL HOSPITAL FOR LONDON.—On the site between St. Martin's-street and Green-street, Leicester-square, the new hospital is being built by Messrs. G. Trollope & Sons, contractors; the architects are, we are informed, Messrs. Young & Hall.

ADDITIONS TO THE SCOTT HOSPITAL AT HUNTLY, ABERDEEN.—New wings have been added to this building. The work was designed by Mr. Marshall Mackenzie, architect, Aberdeen, and the contractors were:— Mason, Mr. Robert Mitchell; carpenter, Provost Pirie; slater, Mr. Thomas Henderson; plasterer, Mr. John Logie; painter, Mr. Alexander Robertson—all of Huntly; and plumbers, Messrs. Blaikie & Sons, Aberdeen.

BOARDING HOUSE, CROMER.—The Cliftonville Boarding House, which was built some few years ago, is being added to this season. A new entrance hall and a large dining hall, both 15 ft. high, together with new kitchens and numerous sitting and bedrooms, billiard-room, and lavatories go to make up an addition which will more than double the present accommodation. All this new part has a frontage to the sea. The dining hall has been finished in the old English manor house fashion, with a marble chimney-piece at one end and minstrels' gallery at the other, special care being bestowed on the coloured glass windows. The entrance is under the archway, 15 ft. wide, in a large square tower, with oriel window two floors high. There are balconies between bay windows and alcoved recesses inside. The architects of this work are Messrs. George J. & F. W. Skipper, and the general contractor is Mr. J. S. Smith, of Norwich.

ADDITIONS TO HOTEL, SOUTHWOLD.—A new wing has been added to the Centre Cliff Hotel, comprising a dining-hall 52 ft. long and 32 ft. wide, and about thirty new bedrooms over this. The style of the old hotel has been preserved in the new work, and hence it is finished in cement stucco. The new wing being two floors higher than the older part, a tower has been formed so as to break the sky-line where the new part joins the old. The architects for this new work are Messrs. George J. & F. W. Skipper, of Norwich; the general contractor is Mr. J. Youngs, also of Norwich; the plasterer's work being carried out by Mr. Crotch.

BIRMINGHAM LIBRARY.—New buildings for the Birmingham Library have been erected at the corner of Margaret-street and Cornwall-street. The architects are Messrs. Cossins, Peacock, & Bewlay. The elevations are in the English Renaissance style, carried out in Ruabon brick and white Hollington stone, with Westmoreland green slates for the roof. The building consists of two blocks at right angles the one to the other. On the Margaret-street side the façade of two stories is divided into three sections—a gabled portion at each end—and between them a slightly recessed division, further subdivided by piers between the windows. The porch is of stone. The entrance admits to a hall, upon the further side of which is the segmental counter of the book-issuing department. To the left is the main lending library apartment. In the block which has its windows to Cornwall-street are a series of rooms devoted respectively to the clerks, the librarian, and the committee. These, while *en suite*, have their separate doors to a corridor, upon the opposite side of which is the lady subscribers' room and lavatories. Ascending by a staircase to the upper floor, access is obtained to the general reading room, 54 ft. by 35 ft., and a conversation room, 38 ft. by 23 ft. These two rooms are divided from one another by sliding doors. The reading room has a portion of the ceiling coved, with exposed timbers ornamentally carved. Upon the Cornwall-street side of the upper floor has been arranged a room for rare books, and the smoke-room and ladies' retiring room, reserved for the special use of proprietors who pay the extra subscription. To each of these there is additional lavatory accommodation. Above these on the attic story are storage rooms for books. A basement contains a library for the books less in request, binding rooms, clerks' mess-room, caretaker's residence, and the heating appliances. In the yard approached by an inclined plane from Cornwall-street is a large shed for the storage of cycles. The internal woodwork is of pitch-pine, adamant plaster is used for the principal walls, and wood blocks are used for flooring. Electricity is used for lighting the whole establishment. The cost of the new library is about 10,000*l*., and the builders are Messrs. J. Barnsley & Sons.

OFFICES, TEES CONSERVANCY COMMISSION, MIDDLESBROUGH.—The foundation-stone of the new offices to be erected in Queen's-square for the Tees Conservancy, has just been laid. The building will have a frontage of 72 ft., and will be four stories high. In the basement will be cellarage, storing-rooms, and munition-rooms. The main floor, which will be raised about 3 ft. 6 in. from the level of the outside footpath, is given access to from the main entrance, which stands in the centre of the frontage, and from which a porch will project about 10 ft. forward from the main building. The main floor contains the offices of the secretary and his staff, and for the payers of dues, and also a committee-room and a waiting-room. These and the main staircase are approached through a wide corridor. On the first floor is a board-room, 50 ft. long and 27 ft. wide, and as high as two ordinary stories of the building, with an ante-room adjoining, and offices for the engineer and his staff. On the second floor will be the offices for the engineer's drawing staff, and for other purposes of a general character. The whole of the floors are fire-proof, and, with the exception of the main corridor, will be laid with wood blocks, in either oak or maple. The main corridor will be laid in mosaic, and the main staircase will be of stone. Each floor will have its own strong-rooms. On each floor is provided lavatory accommodation. At the rear of the building will be a caretaker's cottage. The building will be Renaissance in style, and it will be erected in red brick and terra-cotta. The plans were prepared by Mr. J. M. Bottomley and Mr. W. H. Whipham.

ALMSHOUSES, PUDSEY, YORKSHIRE.—The almshouses which have been erected with money left by the late Mr. Joseph Salter, are situated in Robin-lane. They consist of five houses, in one block, the centre house having a gable and bay window. Each house contains a front living-room, entering from an open porch, a bedroom, a small pantry, and a back entrance porch, containing sink, &c. The whole of the floors are on one level. The buildings have been carried out in stone, covered with dark Westmoreland slates, with red roll ridge tiles. At the back each house has its own outbuildings and yard. The bulk of the contracts were undertaken by local contractors, and the whole of the work has been carried out from the drawings and under the superintendence of the architect, Mr. C. S. Nelson, of Leeds and Pudsey.

ST. JOHN'S HOSPITAL, LEWISHAM.—The foundation-stone of the new buildings at St. John's Hospital, Lewisham, for the Nursing Sisters of St. John the Divine, was laid on Wednesday by the Duchess of Albany. The architects are Messrs. Barnes-Williams, Ford & Griffin. The buildings, which will provide for the reception of thirty-three additional patients, will be of red brick with Monks Park stone dressings and tiled roofs, and the contract has been let to Mr. H. L. Holloway at 5,370*l*. The clerk of works is Mr. J. J. Trimm.

## *SANITARY AND ENGINEERING NEWS.*

SEWAGE DISPOSAL, SWINTON, YORKS.—A Local Government Board inquiry into an application by the Swinton Urban District Council, for permission to borrow 2,450*l*. for the purchase of land in connexion with the disposal of the sewage of Swinton, was held by Mr. W. O. E. Meade-King on the 6th inst. The land, which consists of 12½ acres, is to be used for the deposit of refuse, night-soil, &c. Mr. R. Fowler, the surveyor, gave evidence of the desirability of obtaining the site.

SEWERAGE WORKS, GREAT AYTON.—The main sewerage and sewage disposal works for Great Ayton have just been completed. About three miles of sewers have been laid. The purification of the sewage will be effected by chemical precipitation, and the effluent will be distributed over land on the ridge-and-furrow system. Messrs. Crudas & Son, of Guisborough, have carried out the work at a cost of about 4,000*l*. Mr. Harry W. Taylor, of Newcastle and London, was the engineer, his plans having been selected in competition.

REBUILDING OF THE SEA WALL, WESTGATE, KENT.—This work is now completed. In the winter of 1897 nearly the whole of the sea wall and front promenade were swept away, leaving the cliffs for the greater part of the distance bare. Immediate steps were taken to protect what little of the sea wall and promenade remained, and in the early part of 1898 arrangements were made for the reconstruction of the destroyed portion, which practically extended along the whole front of St. Mildred's Bay. After the work was commenced it was pushed on so rapidly that by the end of July the wall and approaches had been built, the backing filled in, and the promenade so far completed as to allow of its consolidation by its being used temporarily during the rest of the year. The promenade has now been asphalted from end to end with Constable's tar asphalte. A wall has also been built against the cliff in such a manner as to provide shelter seats at intervals along the whole stretch of promenade. Approaches from the promenade to the roadway behind have been formed by slopes at an easy gradient, working through the front gardens to the top of the cliff. Step approaches have also been made and rustic bridges thrown over the various openings. The design and execution was the work of Messrs. A. McIntosh Valon & Son, engineers, London. Mr. William A. McIntosh Valon (Consulting Engineer to the Corporation of Ramsgate) is advising engineer to Messrs. Coutts & Co., who have borne the expense of the work.

LIVERPOOL SCHOOL OF ARCHITECTURE.—An exhibition of work done by students of the City of Liverpool School of Architecture and Applied Art during the past session will be held in the Walker Art Gallery, Liverpool, on Saturday, Monday, and Tuesday next, the 17th, 19th, and 20th. The exhibition will be open from 10 a.m. to 8.30 p.m.

## *FOREIGN.*

FRANCE.—The jury for the open competition for the building of a Hôtel de Ville and Law Courts for the town of Neuilly have awarded the first prize to MM. Defresne, architect, of Argenteuil, and Rousselet, architect, of Ermont. The second prize has been given to M. Colombier, architect, of Compiègne.—— The forty-fifth exhibition of the Société des Amis des Arts of Douai will be held from July 9 to August 6.——The town of Saint Die is shortly going to rebuild the Church of Saint Martin; the expense is estimated at 500,000 fr. ——The frieze in grey ceramique made at the Sèvres manufactory is now being placed in position on the façade at the back of the great palace which faces the Avenue d'Antin. The frieze, which runs the whole length of the building is from the designs of M. Joseph Blanc, and represents the history of art through all ages.——The death is announced of M. Louis Barré, at the age of seventy-two. He was an architect and engineer, and one of the veterans of the technical Press devoted to architecture. Since 1858 he had been on the staff of the *Revue de l'Architecture et des Travaux Publics* with the late M. César Daly, and he drew up the tables of resistance to stress for iron construction, which tables have been used ever since in France. He assisted for some time in the *Semaine de Constructeurs*, and published several important works. Architects frequently addressed themselves to him for the calculations of strains and the solution of various difficult questions in construction. For more than forty years he gave gratuitous lectures at the Association Polytechnique, and his valuable services were recognised by the award of the Cross of the Legion of Honour.

## *MISCELLANEOUS.*

PROFESSIONAL AND BUSINESS ANNOUNCEMENT.—Mr. William Vincent Vale, accountant, 16, Darlington-street, Wolverhampton, has been appointed Secretary to the Wolverhampton Branch of the National Association of Master Builders of Great Britain and Ireland, in place of Mr. George Gough, resigned.

MEMORIAL WINDOWS, ST. MATTHEW'S CHURCH, NEWCASTLE-ON-TYNE.—Two stained glass windows have been placed in this church. The windows were executed by Mr. G. J. Baguley, of Newcastle-on-Tyne.

THE INSTITUTE OF SANITARY ENGINEERS (INCORPORATED).—At a meeting of the Election Committee of this Institute, held on the 7th inst., the following members were elected:—Fellows: H. A. Chadwick, Durban, Natal; J. V. B. Collie, Cape Town; Associates: E. Box, Bexley Heath; W. Jenkinson, Worsley, Manchester; E. E. Rice, Teddington; H. T. Sidwell, Herne Bay; J. Whelan, Dublin.

THE SANITARY INSTITUTE. — The preliminary programme of the Eighteenth Congress, to be held in Southampton, from August 29 to September 2, has now been issued. The President of the Congress is Sir W. H. Preece, K.C.B., F.R.S., Pres.Inst.C.E. Mr. Malcolm Morris, F.R.C.S. Edin., M.R.C.S. Eng., will deliver the lecture to the Congress, and Bailie J. Dick, J.P., Chairman of the Health Committee, Glasgow, will deliver the popular lecture. Excursions to places of interest in connexion with sanitation will be arranged for those attending the Congress. A conversazione will be given by the Mayor (Councillor G. A. E. Hussey). More than 300 Authorities, including several County Councils, have already appointed delegates to the Congress, and, as there are also over 2,200 members and associates in the Institute, there will probably be a large attendance in addition to the local members of the Congress. In connexion with the Congress, a health exhibition of apparatus and appliances relating to health and domestic use will be held as a practical illustration of the application and carrying out of the principles and methods discussed at the meetings; it not only serves this purpose but also an important one in diffusing sanitary knowledge among a large class who do not attend the other meetings of the Congress. The Congress will include three general addresses and lectures: three sections meeting for two days each, dealing with (1) Sanitary Science and Preventive Medicine, presided over by Sir Joseph Ewart, M.D., F.R.C.P., J.P.; (2) Engineering and Architecture, presided over by Mr. James Lemon, M.Inst.C.E., F.R.I.B.A.; (3) Physics, Chemistry, and Biology, presided over by Professor Percy F. Frankland, Ph.D., B.Sc., F.R.S. Eight special conferences—viz., those of municipal representatives, presided over by Alderman T. Walton, J.P., Chairman of the Health Committee, Southampton; Port Sanitary Authorities, presided over by Mr. Millar Wilkinson, Chairman of Port of London Sanitary Authority; Medical Officers of Health, presided over by T. Orme Dudfield, M.D., L.R.C.P., M.R.C.S.; Medical Officers of Schools, presided over by C. G. Shelly, M.A., M.D.; Engineers and Surveyors to County and other Sanitary Authorities, presided over by Mr. E. Purnell Hooley, Assoc.M.Inst.C.E.; Veterinary Inspectors, presided over by Mr. W. Hunting, F.R.C.V.S.; Sanitary Inspectors, presided over by Mr. C. MacMahon, Chief Sanitary Inspector, Torquay; Domestic Hygiene, presided over by

Mrs. Patey. The local arrangements are in the hands of an influential local committee.

ELECTRIC LIGHTING, DARLINGTON. — At the Darlington Town Hall recently, Mr. W. O. E. Meade King, Local Government Board Inspector, held an inquiry into an application made by the Darlington Corporation for sanction to borrow 30,000*l.* for the purposes of electric lighting, and 593*l.* for the purchase of land in Haughton-road for the extension of the existing depot. Professor Kennedy prepared the report for the Corporation.

BRITISH FIRE PREVENTION COMMITTEE.—The testing station of the British Fire Prevention Committee was again the scene of an important series of investigations on Wednesday afternoon, which were attended by Sir John Taylor (H.M. Office of Works), Mr. Alexander Siemens (Institution of Electrical Engineers), and, on behalf of the Council, Mr. H. H. Statham, of the Members' Testing Sub-Committee, Mr. Edwin O. Sachs (chairman) for the Executive, and the usual delegation of ten members. The strictly limited number of visitors was this time chiefly representative of the London County Council; Mr. Waterlow and Mr. Yates, Chairmen of the Building Act and the Theatres Committees, attending, with Mr. Riley, the Superintending Architect, and several officials from his department, the third officer of the M.F.B., and a number of District Surveyors. The leading Government departments and some of the Insurance Offices were also again represented. The tests were conducted by Messrs. Max Clarke, F. R. Farrow, Ellis Marsland, F. Hammond, E. Woodthorpe, and G. Monckton on behalf of the executive, and comprised :—1. A two-and-a-half hours test with a concrete floor by the Columbian Fire-proofing Company, U.S.A., being the severest test so far applied by the committee to any floor. 2. A half-hour test with a skylight of electro-glazed prisms by the British Luxfer Prism Syndicate. 3. A three-quarters-of-an-hour test with plain electro-glazed clear glass casements by the same makers. 4. An hour (comparative) test with an iron door in an iron frame, and an armoured wood door with 3 in. overlaps. The reports describing the tests will be issued by the executive in due course.

## *CAPITAL AND LABOUR.*

LOWESTOFT BUILDING TRADE STRIKE SETTLED.—The strike in the Lowestoft building trade has been settled. The following understanding has been arrived at :—(1) The men (bricklayers, carpenters, and joiners) are to receive 7½d. an hour ; (2) there is to be one apprentice to four men, instead of one to six men, as the men desired ; (3) the first two hours of overtime to be paid ½d. an hour (instead of 1d., which the men asked), and after two hours the pay will be at the rate of time and a quarter overtime to the next hour, to be reckoned after the men had worked 56½ hours as a week ; (4) in winter the overtime hours are to be as per time sheets ; (5) the men have given an understanding not to object to working with non-union men, engaged with union men, and not to "black list" any firms who have employed non-union men or union labour during the strike ; (6) the rules to stand good for two years.

THE BUILDING TRADE DISPUTE : POSITION AT MIDDLESBROUGH.—A joint meeting of the Middlesbrough Master Builders' Association and a deputation from the workmen was held at the Albany Restaurant on the 8th inst. The meeting was of a protracted nature, and at the conclusion the master builders offered the men an advance of ½d. per hour, making a wage at the rate of 9½d. per hour for ordinary purposes, with a rate of 10d. per hour in the works, but without allowing walking time. They also suggested that a committee of masters and men should be formed to consider the question of working rules, and to act as a board of conciliation for the trade in the town. The men's representatives stated that they had no power to settle the matter, but would bring the offer before a meeting of their members.

ABERDEEN MASONS' WAGES.—The arbiter in the submission as to the payment of wages to masons in the monumental trade, Professor J. Dove Wilson, LLD., late Sheriff-substitute of Aberdeen, has decided that from and after Monday, July 31 next, wages must be paid weekly instead of fortnightly as hitherto. This award will, no doubt, regulate the same point as regards wages of masons in the building trade.

JOINERS' DISPUTE, SHIELDS.—The house-joiners of North and South Shields came out on strike on the 12th inst., in accordance with the decision previously arrived at on the masters refusing to concede an advance of from 9½d. to 10d. an hour. Upwards of 400 men are affected. They decline to submit the question to arbitration.

BRICKLAYERS' STRIKE, GRIMSBY.—The whole of the Grimsby bricklayers came out on strike on the 12th inst. for an advance in wages of 1d. per hour. The period is most favourable for the men, as there is a big demand for houses, and building operations were in full swing.

BARNSLEY BUILDERS' LABOURERS' STRIKE ENDED. — The strike of builders' labourers in Barnsley has been brought to an end on the basis of mutual concession, and work will be resumed forthwith. The labourers came out on strike on May 1, along with the masons. The employers sought alterations of working rules, so that they might have greater freedom in utilising the work of their labourers to advantage in various ways. There was no question of wages in the affair. The actual terms of settlement are not stated, but it seems that the employers have abated some of their demands, the men have made concessions on some points, and so have come to agreement. The masons are still out, the employers seeking some changes in their rules, especially in the provision which is aimed at preventing the use of machine-dressed stone, which works harshly in not a few cases, considerably increasing the cost of buildings, and, of course, the rents which tenants have to pay.

STONEMASONS' STRIKE, WIGAN. — The stonemasons' strike in Wigan, which has lasted six weeks, has come to an end. At a meeting of representatives of employers and operators, called on the 13th inst. by the editor of the *Wigan Observer*, who was asked to preside, terms were mutually agreed to, concessions being made by both sides. The wages are advanced to 9½d. per hour from July 1. Certain alterations were made in the rules and a conciliation board consisting of joint representatives was appointed to deal with minor disputes. In case of future proposed alteration in rules six months' notice is to be given terminable on May 1 in each year. The President of the Board of Trade was empowered to appoint an umpire, failing settlement by the joint arbitration board.

## *LEGAL.*

### ACTION AGAINST CONTRACTORS UNDER THE WORKMEN'S COMPENSATION ACT.

THE case of Appleby *v.* the Horseley Company, Limited, and Lovatt came before the Court of Appeal, composed of Lords Justices A. L. Smith, Rigby, and Vaughan Williams, on the 10th inst, on two appeals under the Workmen's Compensation Act, 1897, from the decision of the Judge of the Leicester County Court. The applicants in the case were the widow and children of a workman who had been killed by an accident in the course of his employment. The employers of the man were the Horseley Company, Limited, and the work on which he was engaged at the time of the accident was bridge work and iron work in connexion with alterations at Leicester Railway Station. The work of carrying out the alterations as a whole had been undertaken by Henry Lovatt, and the Company had entered into a sub-contract with him for the bridge work and iron work. The workman had originally been in the employment of the Company as a rivetter at wages at the rate of 2*l.* 10s. a week. In March, 1896, he met with an accident, in consequence of which he was unable to do any work for eleven months, but he was not dismissed from the service of his employers. In February, 1897, he again commenced work, being then employed as a timekeeper and storekeeper, earning wages at the rate of 30s. a week. In this sort of employment he continued to work till his death, in consequence of the accident, his death occurring on September 27, 1898. The County Court Judge awarded the applicants 269*l.* compensation under the Act. The first appeal was brought by the Horseley Company and the question in that appeal was the amount of compensation to which the applicants were entitled under Section 1 (a) (i) of the Act.

Mr. McCardie for the company contended that there had been no break in the employment of the deceased man, and that therefore the compensation ought to be assessed under the section at the amount of the actual earnings received by the workman during the three years preceding September 27, 1898, which was 177*l.* The employers were, however, willing, in order to give the applicants a somewhat larger sum, to treat the case as coming within the second part of the sub-section, and to take as the basis of the compensation the average weekly earnings of the deceased during the period from February, 1897, to the date of his death, viz., 30s., and multiply that by 156, which gave 234*l.*

Mr. McCurdy, for the applicants, contended that the County Court Judge was justified in basing his calculation on the average weekly earnings of the deceased "during the period of his actual employment," which meant during the time that he was actually at work, and in bringing into account the earlier period of work because the relationship of master and servant had continued throughout.

Lord Justice Smith, in giving judgment, said that, in his opinion, there had been a break of eleven months in the employment of the deceased man. He had met with an accident in March, 1896, and was away till February, 1897, when he asked his employers to take him on to work again. They did not give him the same work as he had before, but employed him in a different capacity and at different wages. In his opinion the amount of the award, therefore, ought to be 234*l.*, and not 269*l.*

Lord Justices Rigby and Vaughan Williams concurred, and this appeal was therefore allowed.

The second appeal was also brought by the company, the respondent being Henry Lovatt, and it was against an order contained in the award of the County Court Judge by which, in pursuance of Section 4 of the Act, he ordered the company to indemnify Lovatt against liability to pay the compensation and costs directed to be paid by the award. This order was asked for on Lovatts behalf at the hearing of the arbitration, no notice of intention to claim such indemnity having been previously given to the company.

Mr. McCardie argued that an order for indemity under Section 4 could not be made without notice.

Mr. T. Willis Chitty, for Lovatt, contended that, though where a respondent claimed indemnity against a person not a party to the arbitration notice was required, it was not necessary where the person asking for indemnity and the person from whom indemnity was sought were the undertaker and contractor, who were already before the County Court Judge as respondents to the arbitration.

Lord Justice Smith, in giving judgment, said that in his opinion on the true construction of the rules, it was necessary to give notice of intention to claim indemnity.

Lords Justices Rigby and Vaughan Williams concurred, and this appeal was also allowed.

### IMPROPER MORTAR.

AT West London Police-court on the 9th inst., Mr. William Marchment, a builder, appeared to answer adjourned summonses for using mortar in the construction of walls of three houses erected in Playfair-street, Fulham Palace-road, not composed of materials required by the by-laws of the London County Council. Mr. Seager Berry, solicitor, appeared to support the summonses, with Mr. John Haynes, solicitor, who represented Mr. F. W. Hamilton, District Surveyor for North Fulham ; and Mr. A. J. David was instructed for the defendant. Mr. Berry reminded the magistrate that he was asking for penalties and for orders to pull down portions of the walls. Expert witnesses were called and samples of the brickwork and mortar were produced. In support of the case it was stated that the mortar contained thirteen per cent. of earthy matter, and out of seven samples only one was found correct. For the defendant it was stated that the walls were well built for that class of work. Several samples taken on behalf of the defendant were described as very fair mortar, with the exception of two, which did not come up to the requirements of the by-law Mr. Rose came to the conclusion that it was not a case to order the walls to be taken down. Acting upon the candid opinion of the analyst for the defendant that two of the samples did not come up to the requirements, he imposed a penalty of 5*l.*, with ten guineas costs. The magistrate expressed an opinion that the County Council were justified in drawing attention to the mortar used in the construction of buildings.

### WORKMEN'S COMPENSATION CASE.

A CLAIM was heard in the Westminster County-court on Monday, when Judge Lumley Smith gave his award in the case of Lloyd *v.* Sugg, an action under the Workmen's Compensation Act. The applicant was George Lloyd, sixty-seven, a blacksmith, of North Kensington, and the respondents Messrs. Sugg & Co., gas engineers.

Applicant's case was that he was holding a tool by means of a piece of wood, and a boy who should have hit the tool with a hammer, missed it and hit the wood ; applicant's hand was "smashed" against the anvil, and bones broken. Two days after he was discharged.

Evidence for the respondents was that no bones were broken, and that Lloyd was suffering from gout, which was brought out by the jar. He was dismissed for bad work done prior to January. The boy missed because a spark went in his eye.

His Honor's view at the former hearing was that employers took the risk of employing a man with gout in his system, and if an injury was received which brought out the gout the employer would be liable to pay compensation. His Honour awarded applicant 15s. a week.

### POINT UNDER THE LONDON BUILDING ACT, 1894.

THE case of Elliott & Co. *v.* the London County Council came before a Divisional Court of Queen's Bench, composed of Justices Day and Lawrance, on the 12th inst., which raised a question as to setting up a wooden structure without the licence of the London County Council under the London Building Act, 1894. It appeared that the appellants, Messrs. Elliott & Co., were convicted of doing this by Mr. Curtis Bennett, the metropolitan police magistrate, and the only question to be determined on the appeal which came before the Court in the form of a special case was whether the structure came within Section 86 of the Act which exempts from its provisions as to licences for wooden structures, "structures or erections erected or set up upon the premises of any railway company, and used for the purposes of or in connexion with the traffic of such railway company." The structure in the present case was put up by the appellants, who are coal merchants in the habit of having coal consigned to them at their wharf in the Carlisle-street coalyard of the Great Central Railway Company, under the permission of the Company, and at their own expense. The structure was used by Messrs Elliott & Co. in connexion with their wharf for the purpose of receiving and executing orders for and distributing to dealers and consumers the coal consigned to the appellants at their wharf and was not used for the purposes of the railway company. The magistrate found that the structure did not come within the words and was, in point of fact, not used for the purposes of, or in connexion with, the traffic of the railway company, and was, therefore, not exempt from the necessity of a licence and convicted the appellants. Hence the present appeal.

At the conclusion of the arguments Mr. Justice Day, in giving judgment, said that he had no doubt the Magistrate was wrong. In his opinion the structure was "used for the purposes of or in connexion with the traffic" of the railway company, and was therefore within the exemption.

Mr. Justice Lawrance concurred, and the appeal was accordingly allowed.

Mr. C. A. Russell, Q.C., appeared for the appellants; and Mr. Horace Avory and Mr. Daldy for the respondents.

## ACTION FOR PERSONAL INJURIES.

AT the Clerkenwell County Court, on Friday last week, before his Honour Judge Edge, the case of Charles Beale, bricklayer, 43, North-street, Caledonian-road, *v.* George Maxwell, builder, 310, Brixton-road, was heard. This was a claim for 100*l.* (alternately 50*l.* at common law) damages for personal injuries.

Mr. Scarlett was counsel for the plaintiff, and Mr. Griffiths Jones for the defendant, the action being brought under the Employers' Liability Act, 1880. Plaintiff gave evidence to the effect that on February 21 last he was employed by the defendant at the "Rose and Crown" public-house, Broad-street, Bloomsbury, engaged in the building of a wall. There was scaffolding around it to the height of about 25 ft. He had mounted the scaffold by a ladder, but some scaffolders raised the wall 5 ft., and there was not a proper ladder provided when he was sent to another part of the building. Coming down by that ladder, there was no proper landing provided, and the plaintiff had to land on some old bricks, which gave way. He twisted his ankle and fell on his back.

Mr. Jones said it was not denied that the plaintiff sprained his ankle, but the defendant did not admit any negligence on his part.

The Judge, alluding to the contention that the defendant had not taken reasonable precautions for the safety of his workmen, said he was beginning to think that the British workman wanted to be dry nursed from the beginning of his work until the very end of it.

After a long hearing the Judge assessed the compensation due to the plaintiff at 20s. per week from fourteen days after the date of the accident, while the injury continues.

## POINT UNDER THE METROPOLIS MANAGEMENT ACT, 1855.

THE case of St. Margaret's and St. John's Vestries *v.* Hoskins came before a Divisional Court of Queen's Bench, composed of Justices Grantham and Lawrance, on the 13th inst., upon a special case stated by a Metropolitan Police magistrate upon a summons taken out on behalf of the appellants, the united Vestries of the two parishes, under Section 75 of the Metropolitan Management Act, 1855, alleging that the respondent, Mr. F. C. Hoskins, a builder, did in March last, at 13, Tufton-street, neglect to comply with an order ordering that the lowest floor of the building in course of construction should be kept at such a level as would allow it to be drained into the public sewer. It appeared that the premises in question consisted of a building in course of construction to be used as an armoury storehouse and drill-hall for a Volunteer battalion, and were in the usual way vested in the commanding officer, and intended for the use of the corps only. The complaint was that the floor of the basement, which is a long cellar running under the building, was beneath the level of the sewer. The magistrate decided that, as the premises were to be used exclusively for military purposes, the Act did not apply to them, and dismissed the summons. The rest of the premises was sufficiently drained. The basement being lower than the sewer, it could not be drained into the sewer, but the magistrate thought it did not require to be drained.

Mr. Danckwerts, for the appellants, said the question was whether the building ought not to comply with the Acts relating to the proper drainage of the Metropolis. Volunteer buildings did not belong to the Crown. Under the Volunteer Regulations the Volunteers were obliged to provide buildings for an armoury at their own expense, and he contended that the building did not come within any of the exemptions referred to in the Act of 1855.

Mr. Horace Avory, in support of the decision of the magistrate, contended that the building in question was vested in a servant of the Crown and for the purposes of the Crown, and that it was exempt from the regulation as to drainage.

Mr. Justice Grantham, in giving judgment, said that although it was true the building was used for military purposes, from the case stated there was nothing to show that property used for military purposes only was necessarily Crown property. On this narrow ground the matter must go back to the magistrate, though he (his lordship) would be very sorry if the magistrate should think it necessary under the circumstances to interfere.

Mr. Justice Lawrance concurred.

## MEETINGS.

### FRIDAY, JUNE 16.

*Carpenters' Company.*—Practical Examination at the Company's Schools, Great Titchfield-street. 9.30 to 5.30.

### SATURDAY, JUNE 17.

*Architectural Association.*—Second Summer Visit, to Gatton Park and Church.

*People's Palace Architectural Society.*—Visit to Drapers' Hall, E.C. 3 p.m.

*Carpenters' Company.*—Viva Voce Examination at the Hall. 12 noon.

*Incorporated Association of Municipal and County Engineers.*—Northern District Meeting at Whitehaven.

### WEDNESDAY, JUNE 21.

*Builders' Foremen and Clerks of Works' Institution.*—Ordinary meeting of the members. 8 p.m.

### THURSDAY, JUNE 22.

*Society of Antiquaries.*—8.30 p.m.

### SATURDAY, JUNE 24.

*People's Palace Architectural Society.*—Mr. S. Posenheim on "Defects in Plumbing Work." 7.30 p.m.

## RECENT PATENTS:

### ACCEPTED SPECIFICATIONS.

### *Open to Opposition until August 7.*

[1898] 5,038, Bamber, Heating Apparatus with Regulated Draught for Drying Gypsum, &c. 12,250, G. für Heiz und Beleuchtungs-wesen, and [1899] 7,303, Lewis and Others, Generation of Acetylene Gas. 12,725, Kuhne & Meeks, Gas Regulator and Economiser. 13,304, Arter, 17,591, C. de l'Industrie Électrique, and 27,074, Irish, Electrical Arc Lamps. 13,463, Bloxam, Apparatus for Supplying Liquids in Ratio to One Another. 13,919, Barr, Water Wheels and Turbines. 13,931, Clough, Turner, & Turner, Composition for Protecting and Preserving Metal and other Surfaces. 14,342, Ditchburn & Whitehead, Pickaxes and their Sockets. 14,476, Titchett, Gas Stoves. 14,496, Jones, Pipe Coupling. 15,004, Dawson, Domestic Fire Grates. 15,047, Ham & Beard, Automatical Apparatus to prevent Tidal or Storm Water, &c., from entering Sewers, Tanks, Drains, &c. 15,107, Bayliss, Droppers and Standards for Wire Fencing. 15,208, Gold, Electrical Heaters. 15,375, Adams, Water Closets and their Fittings. 15,796, Woollatt, Measuring Tap. 15,957, Kohl, Glow Bodies for Incandescence Burners. 16,184, Schneider & Smidth, Kilns for burning Portland Cement, &c. 16,416, Alexander, Brick-making and Pressing Machines. 16,433, Haigh, Wood Moulding and Planing Machines. 16,460, Verity's and Steele, Automatical Safety Device, especially for Three-wire or Balanced Systems of Electrical Distribution. 16,515, Carter, Lathe Chucks. 16,641, Stables, Seats. 16,651, Osborn, Hooks for Ladders, &c. 16,818, Fitch, Lock-casing and Mode of Fixing it on Doors. 17,000, Frampton, Nails. 17,361, Cartwright, Circular-Saw Guards. 17,442, Sanders, Wire. 19,684, James, Wallis, and Mackinnon, Non-conducting Fireproof Substance for Use in the Construction of Fireproof Buildings. 21,592, Lefèvre, Bending Pipes, Rolls, Beams, or Bars of any Section. 21,730, Clare and Others, Casement Windows. 21,911, Edwards, Window Fastener. 24,761, Bayldon & Armstrong, Instrument for Facilitating Trigonometrical Admeasurements and other Calculations. 26,177, Smith, Cocks and Valves. 26,407, Walker, Tool-holders. 26,432, Penney, Outside Stop Taps and Boxes for Water and Gas Service Pipes. 26,541, Shaffer, Gas and other Coin-freed Apparatus. 27,399, Thomas & Still, Gas Lamps. [1899.] 3,149, Höft, Grain Silo. 3,441, Böttcher, Automatical Grooving, Tenoning, and Bevelling Machine. 3,577, Lenner, Incandescence Lamp Burners for Liquid Combustibles. 3,884, Savelsberg, Lighting and Extinguishing Gas. 4,276, Tirrill Automatic Potential Regulator Company, Automatical Potential Regulators for Dynamos. 6,305, Hills, Vapour-burning Lamps. 6,490, Edmunds, Means of Extinguishing Fire, and of Protection from Fire. 6,778, Grigg, Automatical Water-tight Ventilation Valve. 6,918, Bachner, Lighting Gas and other Lamps, &c. 7,009, Senking, and 9,137, Hatcher, Gas Cooking Stoves. 7,505, Peerless Gas Lighter Company, Automatical Gas-lighting. 7,522, Hällgren, Apparatus for Use in Working Grindstones, Emery-wheels, &c., or for Working Hard Surfaces. 7,878, Rensing, Manufacture of Bricks, Building-blocks, and Ore Briquettes. 8,341, Gonsalves, Rocking-stops for French Windows, Louvre Blinds, &c. 8,361, Bell, Appliances for Cooling Air. 8,571, Glazier, Hinged or Casement Windows. 8,859, Geometric Drill Company, Lathe and other Tools. 8,997, Kürten, Warming and Cooking by Candles or Lamps. 9,121, Schilling and Others, Shutter Operators and Fasteners. 9,135, Ross & Smith, Window Sashes, &c. 9,262, Vereinigte Pinsel-Fabriken, Paint-brushes, &c.

### ABSTRACTS OF PATENTED INVENTIONS.

3,333. TREATMENT OF SEWAGE, &C.: *F. P. Candy.*—After treatment in anaërobic beds, the sewage or other impure matter is delivered into aërobic filter beds; the former beds have layers of gravel, limestone, coke, or clinkers, covered with layers of clay or marl and fine sand; a channel fitted with a vertical pipe, having an upper water-seal, enables gases to escape, discharge pipes along the bottom of the filter-bed convey the filtered sewage into a chamber furnished with an air-tight cover, a vent-pipe, and a flushing-valve, and flushing-valves may also be fitted to the outlets of the pipes that lead into the anaërobic filter-beds.

3,376.—BRICKS AND BUILDING-BLOCKS: *W. Wright.*—The blocks, composed of earthenware, cement, or concrete, are larger than ordinary bricks, and have handles or recesses by means of which they may be lifted; they are also fashioned with ribs, grooves, or frog, with metal-stripped handles, or with holes, in order that they may be easily handled and carried about.

3,445.—SPRAY DIFFUSERS: *S. Morris & G. B. Hamer.*—The rose is formed in a flat quadrant shape, having transverse bars and plates, or with two long, narrow slits; in another form it has a plate pierced with a number of spiral or concentrical slits, or holes, made by means of rings adjusted by a bolt.

3,447.—SYSTEMS OF LIGHTING, OIL LAMPS AND THEIR SUPPLY, &C.: *W. Reynolds & L. G. Astley.*—With the object of supplying many burners upon one level, the inventors put a main oil reservoir or tank above a secondary tank, which are connected by an air-pipe and an oil-pipe of determined relative sizes; around the lower ends of the two pipes is a tube, having at its lower end a valve connected to the lever of the cock by means of a spring, a bell-crank lever, and chains; when the tank is charged by opening the cock, the valve becomes closed and prevents the flow of oil into the lower tank; but when the cock is closed the opening of the valve admits oil into the lower tank until the lower end of the air-pipe is covered, whereupon oil ceases to flow into the upper tank, until the level of the oil falls low enough to uncover the air-pipe's lower end; for different levels a common supply-pipe may be connected to the main, or uppermost, oil-tank.

3,450.—TREATMENT OF SEWAGE: *F. M. & D. D. Spence.*—The sludge that results from treating alkaline sewage, &c., containing soapy or fatty matters, with sulphuric acid and aluminoferric or sulphate of alumina is separated, dried, and treated with ether, bisulphide of carbon, petroleum spirit, or other solvent, the fats and fatty acids are extracted from the solution, whilst the insoluble matter will serve as manure.

3,490.—SLIDING SASHES: *L. G. Bradshaw and S. J. Fell.*—For sliding sashes that turn inwards, hinges are made by means of a hook and a socket upon the lower sash which engage with a socket and a hook fixed to the frame; the sash descends as the hooks enter the sockets, and its own weight turns the sash inwards, sockets or clips let into the frame receive T-headed hooks which hold the beads in their place, the upper rails of the sashes can be fastened together by a pivotted catch, and the two sashes can be then turned inwards together upon the hinges of the lower one. When detached from the sashes the weight-cords are drawn underneath spring hooks which hang from a plate on the frame.

3,521.—REVOLVING CUTTERS FOR SQUARE-MOULDING AND SIMILAR WOOD-WORKING MACHINES: *J. H. Ollier and W. Brown.*—For fashioning square mouldings upon balusters, &c., the cutters are formed with their cutting edges set at an angle to the shank, in order that they may meet the timber diagonal-wise, and pass gradually into action.

3,522.—MOULDING WOODEN BALUSTERS, &C.: *J. H. Ollier & W. Brown.*—For fashioning balusters and similar articles to square, octagonal, or other shapes in cross-section, is devised a machine to whose sliding-table a squared piece of wood is clamped by two screw clamps, and if an octagonal section is required the wood may be also clamped at the corners. The table carrying the wood is fed by hand over revolving cutter-blocks, having cutters moulded to the shape desired, and with the V-cutting edges described in the inventors' No. 3,521 above. In order to relieve the strain upon the wood it is provided that each cutter-block shall form only a portion of total moulding. At one end of the table is fitted an L-shaped bracket, which fences and clamps the end of the wood.

3,525.—SIPHON-DISCHARGE AND WATER-WASTE PREVENTERS: *F. M. Sims & F. T. & J. H. Harrop.*—Over the discharge pipe, which is trapped at its lower end, is fitted a bell, formed with a globe-shaped enlargement. The raising of the bell rarifies the air and starts the siphonical action, which is further facilitated by means of a short tube open at each of its ends. The entrance of air through a pipe will arrest the siphonical action, and the trap of the discharge pipe may be fixed upon the cistern.

3,536.—RECIPROCATING SAWS: *J. Heyn.*—That it may cut in both directions, the saw is made with its rows of teeth set at a small angle to one another, so that the row of teeth which are not cutting are cleared from the wood, and a gap between the two rows of teeth allows the sawdust to fall out.

3,622.—TAPS AND OTHER FITTINGS FOR BATHS, LAVATORIES, &C.: *J Shanks.*—A cam or eccentric turned by a spindle is devised for opening the spring-pressed valves which control the hot and cold water inlets; the valves are separately lifted by cams or eccentrics upon one spindle, or more, if two or more delivery nozzles are used; in modifications, rotary sliding covers moved by projections that engage cams upon the main spindle are employed to close the outlets, or the hot and cold water inlets are provided with separate valves, the distribution of the water being regulated by a plug which has cavities in its surface, or the hot water inlet may be controlled by an annular valve and the cold water inlet by a disc.

3,641.—SUPPLY COCKS: *F. A. Small.*—On one side of the rocking-lever's fulcrum is a hanging hook that engages with the float-lever; on the other side of the fulcrum is a rod which by means of a detent engages with a pawl when the chain is pulled, and so locks the float-lever whilst the cistern is being emptied. The adjustable tail-piece of a second float-lever strikes an L-shaped lever when the water has fallen to a certain level and so releases the rod from engagement with the pawl, whilst allowing the lever to fall and close the outlet.

3,668.—SOLDERING ALUMINIUM: *H. W. Stilwell.*—After the metal has been cleaned and immersed in an alkali solution, it is plunged into a strong acid solution and coated with nickel or some other suitable metal in a strong bath and with a powerful electrical current; it is then coated or tinned with an alloy, preferably of mercury and lead, and may be soldered in the ordinary manner.

3,793.—REFINING ASPHALT: *W. S. Wilkinson.*—Crude asphalt is refined and prepared for paving and similar purposes by a process which drives off the water and mixes the mass, without over-heating it; by the agency of compressed air jets arranged amongst coiled pipes filled with steam, whose high pressure is regulated by the boiler's safety valve, the tank being brick lined and having an air space.

3,804.—VENEERS: *J. Landuyt.*—For cutting veneers in spiral sheets from a cylindrically shaped piece of wood, the machine is fitted with a presser-bar, which is forced against the rotating cylinder of wood by spiral springs, and so presses the wood in front of the knife; the wood is reciprocated lengthwise by a cam upon the mandril; to the bar, and advancing with it, are connected two racks, with a pinion, which feed markers or blades against the wood. The blades are mounted upon a horizontal bar at required intervals, in order to mark off lengths of the veneer.

3,841.—ELECTRICAL INCANDESCENT LAMP-HOLDERS: *F. Palm.*—Insulating clamps hold the bare main conductors upon which the lamps are placed. In one arrangement the lamp has a cap that carries two end-pins, which pass into sockets for engagement with curved springs bearing upon the conductors. In another arrangement two plate-springs are set in the cement by which the lamp is fixed in a cap, the springs gripping the conductors, and the surface of the cement being waxed.

## TO CORRESPONDENTS.

W. H. B. (Amounts should have been stated).—F. A. C. Below our limit).—A. H. (Amounts should have been stated).

NOTE.—The responsibility of signed articles, letters, and papers read at public meetings, rests, of course, with the authors.

*We cannot undertake to return rejected communications.*

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

We are compelled to decline pointing out books and giving addresses.

Any commission to a contributor to write an article is given subject to the approval of the article, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and *not* to the Editor.

## TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us *not later than* 10 *a.m. on Thursdays.* N.B.—We cannot publish Tenders unless authenticated by the name and address of the sender; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is given, nor any list in which the lowest Tender is under £100, unless in some exceptional cases and for special reasons.]

* Denotes *accepted.* † Denotes *provisionally accepted.*

## *Education for the Building Trades.*

A REPORT made by a Special Sub-Committee on the Building Trades, to the Technical Education Board of the London County Council, has been recently published, along with the evidence on which it is founded. The special object of the Committee was to obtain evidence and make suggestions in regard to the existing facilities for enabling artisans in the building trades to obtain a good technical instruction in their craft.

The occasion for such an inquiry arises of course mainly from the general abandonment, in recent times, of the apprenticeship system; but some passages in the Report throw rather an unexpected light on the causes of this decline. We have heard from time to time expressions of regret, on the part of large employers of labour in the building trade, in regard to the decline of the apprenticeship system, and the consequent difficulty of obtaining thoroughly trained artisans. Yet repeated evidence is given in this Report to the effect that the decline in the number of apprentices, or the practical abandonment of the system of apprenticeship, is due more especially to the reluctance of employers themselves to take apprentices. Mr. Henry Holloway says that "apprenticeship has greatly declined in the building trades of late years, the reason being the indifference on the part of employers, who were of opinion that apprentices did not pay." Mr. Robert Mitchell stated that in his opinion "the objection by the masters to apprentices far exceeds any obstacles placed by the men or their trade unions." In another passage in the Report we read that in the case of joiner's work especially, "the very great establishment expenses connected with a builder's workshop in London necessitates that every bench should be employed in producing the most valuable output, and consequently none but men capable of earning full wages can be allowed to work in the shops." Another reason given by Mr. Robert Mitchell, the educational director of the Regent-street Polytechnic, lies in what he calls, rather awkwardly, the "distributing nature" of the building trade, by which expression he refers, we suppose, to the tendency towards general contracting in place of contracting for special trades. He observes that "in trades such as silversmiths, where the work was always executed in the same workshops, the system of apprenticeship was not appreciably decreasing." The contractor is becoming more and more an *entrepreneur*, a kind of accountant in building trades, and less of a builder, and his object is to work his shops so as to secure a profit under a system of keen competition. Hence even the premiums which may be paid with apprentices are not regarded as compensating for the trouble of looking after them and the loss in productive labour while they are in training.

The fierce competition in the London building trade, in fact, seems to leave no time for either teaching or learning; and one significant fact which comes out in the evidence is that by far the largest proportion of hands in many building shops have come from the country. Mr. Mitchell said that "the building trades were mostly supplied from the country, and mentioned that on one large building on which about 200 men were employed the clerk of works assured him that not more than ten could be strictly called Londoners." Country youths are desirous to be apprenticed to building trades, and country masters are willing to take them; there is time to teach and time to learn. Having learned, they come to London to get a better market for their labour.

The question how far the training which may be obtained in polytechnic and other classes is a substitute for shop apprenticeship is a good deal discussed in the evidence. Mr. Holloway did not attach much importance to the practical instruction given in classes. They should aim at theoretical and scientific instruction; the practical instruction could only be efficiently given in the workshop; and in regard to the instructors he mentions one case in which a young man, employed by his firm in the capacity of joiner's improver, showed so little aptitude that the foreman told him to look out for employment elsewhere. "This man subsequently got a position as instructor at one of the technical classes." Mr. Holloway thinks good foremen make the best practical instructors; on the other hand, another witness, Mr. Carpenter, says that in cases within his knowledge where the learners are in charge of the foreman, and a fee is charged by the foreman (with the knowledge of the employer), frequently the foreman will find some fault with his learner, and he is discharged to make room for another learner who pays a fresh fee to the foreman. These "learners," he observes, ought to be "apprentices," and apprenticed to the employer; they do not get the training of an apprentice in consequence of their insecure tenure. But the same witness mentions another cause (also touched on by other witnesses) for the want of thorough training in the craft, viz.: the increasing use of machinery. "It stands to reason, a lad in a shop where machinery is used would not get the training he would in a hand shop." And this, we take it, may be another reason why the best hands, as seems to be admitted, come from the country, where, owing to the competition being less, and time not so important, there is less machinery and more hand work.

The evidence as to the practical value of polytechnic training varies a good deal. Mr. Phillips Fletcher, the Director of the Trades Training School in Great Titchfield-street, said the men had a great objection to going from a workshop to a class-room, and one reason for this may be gathered from another witness, "A. B.," a builder's foreman, who said "one of the chief reasons why bricklayers did not take up drawing and building construction to qualify as foremen was that their work made their hands too rough to manipulate drawing instruments," which is probably only one phase of the fact that a man accustomed principally to work with his hands, and regarding materials only from that point of view, feels out of place in a lecture room. Mr. Fletcher added that he considered that better work could be done by explaining the necessary science and geometry to a craftsman as he was working with his tools, such practical demonstration having a more lasting effect. Another witness, however, "E. F.," a builder's foreman, says the class teaching did not make them better workmen, "but they did not require so much attention as others, and could do their own setting out." Mr. Barter, organiser of manual instruction under the London School Board, in reply to the question, in regard to boys who have entered for the Technical Education Board's competitions in Science and Technology, "Do you think that these boys pick up trades quicker than others?" replies, "Yes, certainly, and they work more accurately. They understand the meaning of drawings though they may not be able to make doors"—meaning, we presume, before they have learned the actual handling of the materials. Mr. Ellis, teacher of building construction at the Camberwell Green Evening Classes, in answer to the question "Do you find much difference between those who have attended the classes and those who have not?" replies, "Yes; those who have attended the classes can receive their instructions from the foremen more easily than others."

It seems to be considered that there is a great difference between the intelligence of bricklayers and of carpenters over their work. A builder's foreman, "E. F.," says:—

> "The bricklayers were not, as a rule, good workmen. They did not understand their work, and did not attend classes. Every effort had been made to persuade them to attend, but without effect. They gave no reason for not attending. Carpenters as a rule served an apprenticeship for four or five years, but this was not the case with bricklayers. Bricklayers gave more trouble than carpenters through want of intelligence and care. In carrying out a piece of work, an intelligent bricklayer was placed at each end of the work to keep a watch on the less skilled men working between. The difficulty of getting good bricklayers increased. This was largely owing to the absence of apprenticeship in London."

Mr. Howard Colls, the well-known contractor, speaks to the same effect:—

> "The technical workshop was the means of attracting men to classes, but when used as a producing shop was valueless. Generally speaking carpenters were better able to read drawings than bricklayers, and they also made better foremen of works, which pointed to the fact that drawing was a good subject to teach bricklayers. Bricklayers might, however, be good men without being able to read drawings. Carpentry was a more highly skilled trade than bricklaying, except in some of the higher developments, such as groining, &c. Carpenters had more opportunity of becoming foremen, as they invariably remained from the beginning to the end of a large piece of work, whereas bricklayers were constantly changed. A carpenter was able to set out a bricklayer's work, but nine out of ten bricklayers never looked at a drawing. The carpenter was a superior kind of workman and had a better chance of becoming a master."

No doubt this superior intelligence on the part of the carpenter is due not only to the fact mentioned by Mr. Colls, that a man keeps at the same work till it is finished, and therefore learns more of the setting out of work as a whole, but also to the more educational character of the work, and to the fact that it is not so rough as ordinary bricklayer's work. The general conclusion seems to be that the bricklayer requires some general and theoretical education more than any other of the building craftsmen, and is unfortunately more averse to it than any other. And it is difficult to see how this is to be overcome until superior skill and knowledge bring their own reward in higher wages. As long as employers are compelled to pay the stupid workman as much as the enlightened one, there is practically a premium on stupidity.

This important point is touched on several times in the course of the evidence. In regard to the Plasterers' Association, of which so much has been heard lately, Mr. Holloway observed that "The Plasterers' Association insisted on apprentices commencing not later than seventeen years of age. The object of the plasterers in so doing was to limit the number of plasterers. No other trade imposed such a restriction as far as he knew." Mr. Howard Colls tells the same story in regard to the bricklayers. "The bricklayers attended classes with the intention of learning brick-cutting. The object in limiting the number of workmen at classes was to decrease the number in the trade so as to make work last longer." Suppose the Institute of Architects endeavoured to make some similar restriction on the number of pupils an architect might have, and the Architectural Association to restrict the numbers in its classes, in order to limit the number of the profession, what an outcry we should have, and what indignant articles in newspapers of all shades of opinion! But the building trades may pursue this policy without a word being said against it. One may reverse Shakspeare's couplet and say—

> "That in the soldier's but a choleric word,
> Which in the captain is rank blasphemy."

In regard to the forced equality of wages, again, one of the builder's foremen witnesses puts the common sense of the matter in plain English:—

> "In all cases the workmen should be divided into two classes, and two rates of wages should be paid—the higher to the superior and the lower to the other workmen. The trade unions demand a minimum wage to be paid to all workmen, whether good or bad, and the employers were bound to pay them the full wages. The reason why there were not more good workmen was that the men were not properly trained. Until workmen were thoroughly qualified they should not be allowed to draw full wages. At the present time some of the workmen admitted into the society had little training. The societies might divide their members into two classes, according to skill; this division would be an advantage to the employers as well as to the skilled workmen. It is by no means fair to compel employers to pay full wages to incompetent workmen. In case of slackness of work the incompetent men would be the first to be discharged. A man's ability could not be ascertained until he had been actually put to work, as he had no credentials as to his qualifications. In France a good system of obtaining information as to a workman's ability was in vogue. An apprentice was provided with a book, and on his term of apprenticeship expiring, the employer's name, time of service, and qualifications were entered. In entering upon further employment his book of credentials was shown, and on leaving, the employer's name, time of service, and qualifications were again entered, and so on from firm to firm. It would be possible for the societies in England to establish some similar method of recording workmen's qualifications."

Mr. Rowland Plumbe, who gave evidence before the Committee, speaks strong on the same point.

> "As far as I can see there is no great incentive with regard to a young workman acquiring a scientific knowledge of his trade, as he is paid just the same rate of wages as the other men. This I think a very important point to consider. Special skill and knowledge should command a special wage. No doubt some men learn for the pleasure of doing so, but only a very few. There may be an incentive in a young man's hoping in time to become a foreman if he is better qualified than others."

It is not surprising that along with this we find criticisms on the indolence of the men and their want of interest in their work. One witness (Mr. Ellis), in reply to a question whether the deterioration in the workman was not due to the fact that machines now perform so much of the work formerly done by the men, answers, "Yes, partly so, but also to the fact that they do not take so much interest in their work." Another witness says:—

> "Most of the men had technical classes in the neighbourhood, but did not trouble to attend them. A qualified builder should be able to do archwork, brick-cutting, gauged work and glazed brickwork. A bricklayer years ago sometimes laid nearly 2,000 bricks a day, whereas now he only laid about 500 or 600. This reduction in the quantity of work done was brought about by the workmen themselves, and not by any action of the trade union."

It would surely be more correct to say that in this respect the men faithfully second the teaching of the trade union. While average human nature remains what it is, the gospel of doing as little work as possible for as much pay as possible is one that stands little in need of preaching.

In our opinion, it is this monstrous and unnatural state of things in modern building trade, whereby the bad workman has to be paid at the same rate as the good, which is more than anything else at the bottom of the whole difficulty with which the Report of the Sub-Committee is concerned. It is really perfectly absurd, if one comes to take a broad view of the whole evidence given here. We have put before us, on the one hand, a system whereby superior training on the part of a workman is rendered null and void so far as any advantage to himself is concerned, and on the other hand a medley of suggestions for compelling him to educate himself and inducing others to educate him. The cream of the joke is reached in the evidence of Mr. King, of the Amalgamated Society of Carpenters and Joiners. He thinks that the County Council might carry out their own buildings, and make them an apprenticeship school, throwing the cost on the ratepayers.

> "The County Council have a grand opportunity at the present time. They are going to build workmen's dwellings, and they might do the work themselves. After the boys had finished two or three years at college working at their trade, the County Council might take them to work in the shops One reason why the employers do not take apprentices is because of the bother, and the room is of value. The apprentices do not pay them. They want men to do the work. I think that it would be a great advantage if the County Council carried out such a scheme.
>
> Mr. Roberts: You think it does not pay, then?—No.
>
> Mr. Roberts: *Would you throw the loss on the rates?—Yes.*"

So that, having allowed a system to be forced upon us by which the artisan is deprived of all benefit from superior training or superior industry, we are now to give him, at the public cost, a training which he has no inducement to seek for himself!

People may depend upon it that the real mischief, to which the Sub-Committee have given but partial and passing attention, lies in this fact—that under the trade-union system the artisan has lost the advantages which ought to accrue to him from superior training, and therefore has no inducement to try to obtain it except that desire to learn and to do the best work, for its own sake, which operates only on a few exceptional natures. There are other obstacles to good training now—the introduction of machinery, and the hurry and close-cutting brought about by keen competition, in the capital at all events; but the system of the same pay for the good workman and the bad is what is at the bottom of the whole thing. Let a building artisan discover that he will command better situations and higher wages by obtaining a better training in his craft, and he will be pretty sure to obtain it.

After this main point, the most important question is that of technical class training as against workshop training. The general weight of the evidence before this Committee goes to show (what logically there could have been little doubt of) that while the technical class training will not in itself make a workman, it is a most important preparation for enabling him to take an intelligent view of his work, to know why a thing is done in this or that way, and to understand better the drawings he sees and the direction he receives. The only doubtful point, perhaps, is as to the time and place for each class of training. The view which we think the evidence in this Report tends to support, is that the workshop and technical class cannot very well be carried on simultaneously; the worker with his hands all day is not in the fittest state to attend evening classes afterwards. What seems, on the whole, the best method, is that the learner should get general knowledge of the subject of his craft, and of the geometrical or other science which bears upon it, first, by going through a technical school, where he would also get some practice in the handling of tools, though not such as he would get at the workshop. Then he would come to the workshop with a mind better able to take in and understand his work, and would probably be much better worth taking as an apprentice than a boy straight from primary education alone. But the great thing is that he should be able to feel that in getting this superior knowledge in the technical class he is laying the foundation of his own advancement as a workman, which at present is not the case. He may look to become a foreman, but otherwise he will find himself no better off than the less skilled workman; a state of things which is an anomaly.

◆

## SCULPTURE AT THE ROYAL ACADEMY.

THE proportion of interest in the sculpture of this year, in comparison with that of the pictures, is really remarkable. Among the sculpture exhibits it may be said that there are few things that have not some interest, while with the pictures it is the other way about; it is only a minority of the works that are of interest.

The largest and most prominent works in the Octagon Room, unfortunately, belong to that class of realistic portrait sculpture for which there is a demand in England, but which are in reality out of keeping with the art of sculpture, as the sculptors probably themselves feel; they have to make the best of an almost hopeless task. In place of a work of poetic sculpture for the central position of the octagon, we have only Mr. Thornycroft's "buff-jerkin business" of the Cromwell statue, and the principal side positions are occupied by Mr. Longmaid's statue of Watt, Mr. Drury's of Priestley, and Mr. Brock's of Sir William T. Lewis, the last the most unhappy of all, as being clad in the modern trowser. We may speak of all these with the respect due to their authors, but we do not call them sculpture, and have no wish to see them again. The first work of sculpture proper is Mr. C. J. Allen's "Rescued" * (1,879), a nearly nude group of father, mother, and infant, treated with much feeling, and which has the merit of forming a harmonious composition from every point of view, though we may observe that, as seen directly in front, the right leg of the man strikes one as being a little too large and too long for the other limb, but it may be an effect of position only. Omitting for the present the works which may be called decorative, we may pause next before Mr. Lucchesi's very clever and thoughtful though rather puzzling work "The Myrtle's Altar" (1,894), showing a nude female figure of much character and very cleverly modelled, reclined on the stump of a tree with a metal myrtle wreath over her head; various articles—a crucifix, a sword, a crown, a heap of money—are dropped around, emblems apparently of all that is given up for the sake of the myrtle wreath. This is at all events a work of real originality. Mr. Pomeroy's "The Potter"* (1,903) is one of the interesting class of nude figures representing a simple *motif* of human action, with no ideal meaning; the potter's countenance, as he considers his work intently, is a keen and interesting one; the whole attitude of the figure has a Greek simplicity and repose. Among the smaller works is Miss Esther Moore's "Aurora Vitæ"* (1,888), two busts of girls whose expressions form a charming contrast, and Miss Kathleen Shaw's exceedingly clever statue of Kipling's remarkable creation "Mowgli" (1,901), which was seen in plaster here in 1897, and is now exhibited in bronze; as a realisation of Kipling's ideal it shows ordinary imaginative power. We regret, however, that in the bronze version a mistaken fit of prudery (perhaps on the part of an intending purchaser) has induced the artist to interfere with the frank nudity of the figure, and to that extent spoil its character as a personification of the child of nature. Mr. Cowell's boy riding on a colossal snail (1,908) is what we should call a bad joke.

Among the prominent works occupying the centre of the floor in the Lecture-room a melancholy interest attaches to the group in ivory and bronze by the late Mr. Harry Bates (2,050), to which no name is given in the catalogue, though the title, "Mors Janua Vitæ," is conspicuous on the front of the pedestal. This is a small work in ivory and bronze, which looks as if it owed its inspiration to Mr. Gilbert. The nude ivory figure represents the Soul, which is led onward by a bronze figure of Death, whose spread wings partially surround it; below is a kind of symbolism of the earth she is leaving—a miniature city, in which the simulacrum of St. Paul's Cathedral is prominent, while around the pedestal are small symbolical groups in ivory and bronze, the ivory ones representing apparently happy souls, the bronze ones "the spirits in prison." The whole work is singularly beautiful and interesting, though this use of different materials for different figures, or for the body and the raiment of a figure, is in doubtful taste from a sculpturesque point of view; and we observe that it is rather on the increase. At the Paris Salon were to be seen two or three life-size statues in built-up polychromy of this kind, and these we can only regard introducing a false and sensational element at variance with the highest aims of sculpture. On a small scale and where metal is employed it is less objectionable, and we do not know that Mr. Bates's conception just referred to is spoiled by it, but on a larger scale it would be. The tendency in such works, however, is for the decorative effect to override the sculptural expression, as in Mr. Frampton's "St. George" (1,932) a statuette with a base of tortoiseshell supporting an agate globe on which is a metal figure of St. George in gilt armour, with a background of mother-of-pearl plaques; the whole effect is very pretty, but it is only a kind of large ornament; the expression of the knight, which should be the principal point, is about the last thing one thinks of. Mr. Reynolds-Stephens's "Sir Lancelot and the Nestling"* (2,037), a work of the same kind on a rather larger scale, is redeemed from being merely decorative by the fine character of the head; the symbolical treatment of the base is interesting too. But we fear that Mr. Gilbert's brilliant example is tending to encourage this class of work rather too much, in which material and execution attract the attention more than the sculpturesque ideal of the work. Mr. Derwent Wood's "La Paimpolaise"* (1,998) is an experiment of the same kind on a life-size scale; the bust of a Breton peasant woman in three materials—a dark wood for the dress, a lighter wood for the face, and wrought tin for the cap. As this may be considered only as a character sketch, it may be accepted as an interesting experiment.

Among some of the cleverest sculptors of the day there seems to be a tendency to seek for originality and character in a work even at the expense of beauty. We see this in Mr. Goscombe John's remarkable conception "The Elf" (2,047) seen in plaster last year, now in marble; a work certainly more curious than beautiful, yet which is a really imaginative conception, and moreover most admirably modelled. Mr. Colton's "The Girdle" (2,056), a seated nude figure trying on a girdle, is original but ungraceful in attitude and line; his "Image Finder" (2,048), a very powerfully designed figure, is also devoid of beauty, though more decorative in general line than "The Girdle." Both these works were exhibited in plaster last year; we are glad to see "The Image Finder," which is a remarkable work, in more durable material; we could well have spared a re-appearance of the lady of the girdle. Whether character without beauty in sculpture is or is not better than beauty without character may of course be a legitimate subject of question; but why not try for both qualities? It is dangerous in sculpture to begin to leave beauty out of sight. Mr. Roscoe Mullins's "My Punishment is Greater than I Can Bear" (2,054), a marble which also has appeared before in plaster, has less distinctive character, certainly, than either of the three last named, but it has the repose of expression and decorative line which are among the best attributes of sculpture. Among the larger works in the sculpture-room one placed against the wall claims notice, Mr. Reynolds-Stephens's "Dante at Ravenna"* (1,942), showing a remarkable seated figure of Dante bending forward in deep thought; below one sees the portions of two figures representing Paolo and Francesca. We should add that our illustration is from a photograph of the clay model, not of the finished bronze, which is an improvement in some respects on the model.

---

* Those marked with an asterisk are illustrated in the plates in this issue.

Decorative sculpture is considerably represented this year. We see it in two of the largest works in the octagon—Mr. Drury's base and pedestal for a street electric light, of which a separate special illustration is given, and which is referred to under the head of "Illustrations," and Mr. Dressler's very original pillar for a sundial*, with high relief figures at the top representing the four winds. We are certainly in want of some new and original suggestions for the pillars of sundials; the only objection, perhaps, in this case is that the sundial itself is rather too subordinate. In front of this stands Mr. Simonds's pretty and fanciful design for a fountain, "Song and Dance" (1,905), in which a female figure plays and sings on the central base, and three flamingoes practice dance-steps at three corners of a triangle below. The one thing that spoils it is the naturalistic rockwork forming the centre pedestal; this should have been conventionally and symmetrically designed in harmony with the decorative intention of the work. In the lecture-room is Mr. Herkomer's very elaborate design for a shield, "The Triumph of the Hour" (2,016), with pictures in enamel; a work rather suggestive than entirely successful in effect, and in which the symbolical meaning is not very clearly expressed. Among smaller decorative works in metal are some well worth attention; a casket* (1,926) by Nelson and Edith Dawson; another by Mr. Alexander Fisher (1,966), with a tree worked on the surface in low relief, winged figures at the angles and another as if entering a doorway above—a little work of great charm; Miss Florence Steele's christening-cup (1,986), with four winged figures in low relief representing special graces; Miss Moore's "Electric Lamp"* (2,008) spirited, but a little too ragged in line; Mr. Alexander Fisher's "Crucifix" (2,014) in cast silver; and Miss Mercer's well-designed and classical-looking silver bowl (2,031). The time has come when the Academy ought to set apart a separate room for this class of work.

Among other works specially worth notice, and which we have only space to mention, are "Leopard Running" (192) by Mr. J. M. Swan; "Miss Elspeth Campbell" (1,935), a tiny silver portrait medallion by Mr. H. Bruce Joy; Miss Casella's "Laura and Petrarca" in coloured wax (1,949); Mr. Goscombe John's "Portrait of a Lady" (1,936), a relief in copper gilt; Mr. Pomeroy's very fine bust of Miss Wackerman (1,956); Miss Rope's silvered bronze panel of children dancing (1,974); Mr. Sargent's "Design for Part of a Mural Decoration" (1,987); Mr. Armstead's two fine portrait medallions in bronze, 2,004 and 2,018—the latter a portrait of the late G. P. Boyce, the artist; M. Cazin's frame of silver medals (2,034); and Miss Rope's two bronze door-plates * (2,046). Let us not forget also, as one of the prominent objects in the centre of the Lecture Room, the marble bust of the Queen by Mr. Onslow Ford—a masterpiece of fine and forcible work.

## NOTES.

**Gold Medal Night at the Institute.** WE hope, and indeed we have very little doubt, that there will be a large attendance at the Institute on Monday night to do honour to the occasion of the presentation of the Royal Gold Medal to Mr. Bodley. The fact that Mr. Bodley has shown his appreciation of the honour by joining the Institute, after having stood apart from it for many years, should be an extra inducement to give him a hearty welcome. Mr. Bodley, as a church architect, represents the best traditions of the Gothic revival, and has carried out churches which, in their refinement of treatment, have in some cases almost the interest of original Mediæval work; while in various secular buildings he has handled what is called Free Classic with equal refinement. In awarding the Gold Medal to him the Institute will have the sympathy, we imagine, of all parties in the profession (" or art ") of architecture.

**South Kensington Museum.** THE question put to the First Commissioner of Works on Tuesday by Captain Norton, as to the proposed one-story gallery across the inner quadrangle of South Kensington Museum, which, he said, "would greatly detract from the architectural beauty of the buildings," entirely ignores the real point of the matter, which has a most important bearing on the plan of the completed building. Without this corridor, the internal lines of communication of the plan will be very circuitous and rather bewildering to visitors. The proposed corridor will furnish a central route from the front entrance to the central point of the existing buildings, and it will, moreover, give an internal effect which will more than compensate for breaking the unity of the lower story (only) of the quadrangle. The objectors have evidently not studied the plan, and do not understand the importance of the central corridor in regard to plan. The request to the First Commissioner "to consult with other authorities on architecture as to the effect which this gallery would have on the quadrangle" seems rather an impertinence to Mr. Aston Webb, who understands the requirements of the plan better than any one else, and who would be the last person to wish to introduce any disturbing feature into the existing building except to gain a more important improvement. If the central corridor is not allowed to be added now, it will probably be found that it will have to be added later on, for the convenience of the public.

**The Boscoreale "Treasure."** THE volume of the Monuments et Mémoires (Fondation Eugène Piot) just issued (Vol v., 1899) should interest an unusually wide circle of artists and connoisseurs. It publishes in full the magnificent collection of silver cups, plates, &c., already famous under the name of the Boscoreale treasure. The Boscoreale silver plate is now safely enshrined in the museum of the Louvre, thanks to the munificence of a patriotic millionaire, M. le Baron Edmond de Rothschild. It was on Easter Eve, April 13, of 1895, that the treasure came to light at Boscoreale. The excavations there had been practically concluded, the workmen had just been paid for the week, and the following week were to be dismissed. The plan of the cellar had been fully made out, but just before leaving they decided to clear out a well full of débris. One of the men went down the well and came up hastily, pretending to be ill from the bad air. The fact was he had lighted on the treasure and desired to keep it secret. It is owing to his presence of mind that the "treasure" was safely smuggled out of Italy and reached the Louvre. On May 23 it was offered for purchase to the Louvre at a price of 500,000 fr. (20,000*l.*). The Conseil des Musées could only offer 10,000*l.*, and gave up all hope. On June 22 a telegram was received stating that M. Edmond de Rothschild had bought the "treasure" and presented it to the Louvre. The "treasure" is now exposed in a special case in the centre of the Salle des Bijoux antiques. Baron Edmond de Rothschild's example was happily followed by other amateurs into whose hands scattered specimens of the Boscoreale treasure had come. Mr. E. P. Warren, an American collector, Count Tysykiewicz and two Italian antiquaries generously gave up specimens they had obtained. The only missing fragment is now the head of a woman which had been violently wrenched from a phiale in ancient times. This head is in the British Museum. For particulars of this unique collection of silver plate we must refer our readers to the thirty fine plates of the "Monuments et Mémoires." The plates are accompanied by a full commentary, which will not, however, be complete till the next number.

**St. Dunstan-in-the-West.** IT is to be hoped that the proposed building up of this church, which forms so conspicuous and interesting an object in Fleet-street, will be prevented. There can be no doubt that the present aspect of the tower, seen standing out from the church and with an open space on each side of it, will be entirely spoiled by building up close against it so as to leave only its front exposed. Its present appearance forms one of those picturesque incidents which here and there relieve the London streets, and which seem to be regarded by many people only as waste space which might be remuneratively filled up. At this rate all the picturesque element remaining in London will soon be wiped out.

**Our Manufacturing Trade with China.** IT is interesting to hear that Sir Chih Chen, the Chinese Minister, is proposing to make a tour of the English manufacturing districts, with the intention of writing a book on the subject, in order to assist in bringing China into closer industrial relations with England. There is likely to be an increasing demand for European manufactured goods in China, and we ought to welcome any action which seems to tend towards assistance in opening the door wider for the employment of English firms.

**Electric Lighting in the City.** THE granting of a Provisional Order by the Board of Trade giving the Charing Cross and Strand Electricity Supply Corporation powers to commence a competitive supply in the City is in the interest both of consumers and of ratepayers. The City Company has neither managed to keep up with the demands made on it nor given its consumers the benefit of the economies effected by improved apparatus and systems of distribution. At times of heavy load the plant was overloaded and all the lamps burned dimly. The charge, too, of eightpence a unit was excessive. When competition was threatened the price was reduced, and a further reduction to sixpence a unit was promised from January 1 next. Their promises, however, came too late, and the Board of Trade has sanctioned competition. The Charing Cross and Strand Company has power to charge up to fivepence per unit for general lighting purposes, which is reducible by a sliding scale to nearly fourpence per unit. For power threepence per unit will be charged until a certain amount has been consumed, and then twopence per unit will be charged for all consumed in excess of this amount. Sir Courtenay Boyle has invented a new method of stating a sliding scale, which, whatever its merits, may well puzzle even electricians. He says that the charge per quarter will be fivepence per unit for any amount up to the number obtained by dividing the number of watts in the maximum power demanded by ten, and fourpence per unit above this. We work out that this means that the charge will be fivepence a unit up to the number that would be consumed by the maximum number of lamps ever burning at one time, if they were alight on an average for sixty-six minutes every day in the quarter, and fourpence per unit above this. The Charing Cross Company is bound to erect a generating station in the City within two years, and at the end of fourteen years the City Corporation will have the option of purchasing it. There is plenty of work for both companies to do in the City, and the older company has the advantage of being already connected on to the most profitable consumers.

---

**Austrian Cement Tests.** THE results of a number of tests carried out during the year 1898 in Austria have been published by K. Berger. Most of the tests were made in accordance with the directions issued by the Architects' and Engineers' Union of Austria. Of twenty-six Portland cements, only two failed to satisfy the tensile strength test at seven days after gauging, and only one the compression test. More than half of the nineteen Roman cements, however, failed to satisfy the conditions of the tensile strength test at seven days, although after four weeks only one-fourth failed in tensile strength, and one-third in resistance to compression.

---

**The London Gas Inquiry.** THE inquiry into the powers of charge by the metropolitan gas companies by a Select Committee of the House of Commons is nearing its conclusion, for the witness who followed Mr. Livesey is Mr. W. J. Field, the secretary and general manager to the Gas Light and Coke Company. Mr. Field admitted that, owing to the clause which compels the Gas Light and Coke Company to sell gas in their district south of the Thames at the same price as the South Metropolitan Company, the former company sold their gas last year on the south side at nearly 1½d. per 1,000 cubic feet below cost price, the total loss amounting to 5,759*l.* As, however, his company sells only 953 million cubic feet on the south side, and sells 20,000 million cubic feet on the north side of the Thames, the loss of 5,759*l.*, added to the price of gas on the north side, represents an increase of only 0·07d. per 1,000 cubic feet. But this district on the south, which is apparently of little value in the unskilful hands of the Gas Light and Coke Company, would yield a handsome profit if given to the South Metropolitan Company, and under the circumstances it is not surprising that some of the members of the Committee pointed out to Mr. Field that it would evidently be an advantage to the Gas Light and Coke Company if they were relieved from the necessity of supplying gas south of the Thames. The suggested transfer might enable South Metropolitan prices to be reduced still lower, but would not cause a reduction of ¼d. per 1,000 cubic feet in the price of gas north of the Thames.

---

**Martlet-court, Bow-street.** THE London County Council have made an order agreeing to the formation of a new thoroughfare for foot-traffic between Bow-street and Drury-lane, which will absorb Martlet-court, most of the occupiers wherein are already served with "notices to quit." Martlet-court, formerly Martlet's-row, had been a favourite quarter of actors in the last century, and could boast of many celebrated residents. Amongst them we may mention John Mills, who died there in December, 1736, and was buried in the St. Martin-in-the-Fields graveyard, Quin, the two Cibbers, and others supporting his pall;* Hull, stage manager at Covent Garden Theatre, and founder of the Theatrical Fund; Suett, the comedian, who on the stage was the very personification of fatuous whimsicality; Shuter, at No. 2, in 1756; Thomas Dibdin; O'Keefe, the dramatic author, in or about 1780; and, it is said, Harriet Mellon, who afterwards married Thomas Coutts, the banker. The adjacent Crown-court, upon the Bedford Estate, is to be extended, for foot-traffic, in a similar way.

---

**The Sheldonian Theatre, Oxford.** THE annual Report of the Curator of the Sheldonian Theatre embodies a statement, made upon Professor A. H. Church's authority, which goes to show that the pictures upon canvas, in the ceiling, are in a very sorry condition, and need speedy attention. They were painted by Robert Streater (1624-1680), appointed serjeant-painter at the Restoration, who also executed some paintings for the chapel at All Souls' College. Pepys records in his diary, February 1, 1668-9, his visit, with Danckers, to Streater's studio in London, where, he says:—

> "I found him and Dr. Wren and several virtuosos looking upon the paintings which he is making for the new theatre at Oxford . . . . they will certainly be very noble; and I am mightily pleased to have the fortune to see this man and his work, which is very famous. And he a very civil little man, and lame, but lives very handsomely."

The paintings, which have been thrice restored since, were set up in readiness for the opening of the theatre—one of Wren's first public buildings—in July, 1669. The theatre was begun in 1664, at the charges of Archbishop Sheldon, who defrayed the cost of the fabric, 12,470*l.*, and endowed it with a maintenance fund of 2,000*l.*, the surplus to be applied to the building of a printing-house. The work of the University Press was carried on in the space beneath the roof until the completion of Sir John Vanbrugh's printing offices, erected (1711-3) with the profits of the sale of Lord Clarendon's "History of the Rebellion," of which his son had presented the copyright to the University. The roof, by Wren, having become decayed in 1800 was replaced with another of different design and without the oval dormer windows shown in old prints, and in the books issued therefrom by the University Press. It is said that Wren based his plans upon those of Julius Cæsar's Theatre at Rome which Augustus dedicated to the memory of his nephew, Marcellus, and which had a capacity of more than twenty thousand spectators. Dallaway states in his "Anecdotes" that Wren owed the idea of the roof, 70 ft. by 80 ft., to Serlio, and Dr. Wallis, whose plan was given to the Royal Society.

---

**Portraits by M. Benjamin-Constant.** THE portraits by M. Benjamin-Constant, now on view at the Society of Fine Arts Gallery, are of peculiar interest not only as examples of the work of one of the first French painters of the day, but also as showing a system of giving special treatment to a portrait in consonance with the character and individuality of the sitter. The style is in general somewhat hard, and there is rather an *ad captandum* glitter about some of them which we do not like, but the speciality of treatment is very remarkable. The bust portrait of the Duchess of Mecklenburg, a bright-looking blonde, is set amid a scheme of bright colour, with a classic marble colonnade, indicated rather than painted, forming part of the background. The full-length of M. Paul Sohège (which we have seen before in the Salon) is a prosaic representation of a society man—a likeness simply, and nothing more; while the intellectual head of the Comte Henri Delaborde, in the green-sprigged uniform of the Académie, is treated in a totally different style, much softer and broader in manner; this is one of the finest works in the room. In quite a different way again is that of Mdme. Emma Calvé; essentially a theatrical portrait, representing a splendid-looking dark-haired woman in a sumptuous dress of crimson velvet; the whole rather after the manner of Carolus-Duran. Then we have in others what may be called the portrait *de luxe*, where rich costume is an important element, such as those of Mdme. Tourton and Princesse Radziwild, the former bespangled with gold braid and jewellery, the latter in a rich black dress with a pearl necklace—and by the way, an almost impossible waist, approaching to that of the conventional fashion plate. We do not like either of these two last, though they represent probably what the sitters or their friends valued most. But the collection as a whole is one that all who are interested in portraits should visit.

---

**Drawings of the Holy Land.** THE collection of drawings of Jerusalem and Holy Land, by Mr. H. A. Harper, exhibited in the new room which the Fine Art Society have added to their gallery, may be said to be rather of topographical and religious interest than artistic; that is to say, the drawings as a set are remarkable not so much for effect and the treatment of landscape as for the obvious intention to give a correct representation of the scenes portrayed. This has its own interest, no doubt, but it is not exactly what one goes to an art exhibition for. The large view of "Jerusalem" at sunrise, however, is a fine and effective picture; the curious pile of houses representing Jaffa is characteristically treated, and it is interesting to see the sketch of the recently discovered cistern (rather than pool) between stone walls, which Jerusalem archæologists have no doubt in identifying as the Pool of Bethesda. Generally speaking, the style of the drawings is superior to what one often sees in topographical collections of sketches; but the topographical interest nevertheless predominates.

## TIMBER AND TIMBER STRUCTURES.*

### Part I.—The Material of Carpentry and Joinery.

The decay of an organised body is familiar to us. By an organised body, I mean one that has been alive. In an animal vitality prevents decay, except as a disease, but as soon as the animal is dead decay sets in, and proceeds, rapidly in some parts, slowly in others. The flesh of an animal decays in a few days, the bones last centuries. There are means of retarding the decay of the flesh, as you know, and means of hastening it. In a plant the vitality is lower, and decay during the life of the plant more often occurs, but in the main the condition of a tree is similar to that of an animal. There are parts in a piece of timber newly felled which are easily acted upon by the agencies that make for decay, and others that offer a long resistance, but these are intimately mixed together in the log of wood, and not so distinct as the flesh and the bones of a dead ox.

The trunk of a tree may be compared to a great bundle of tubes, which make up the entire log. Within those tubes, which lie near the outside, the circulation of the juice known as the sap, which rises in the spring and descends in the autumn, takes place. Those tubes nearer the heart of the tree have been squeezed together, and partly filled with resin and similar matter, and form a more or less compact mass which does not decay easily. The outer part, accordingly (the sap-wood), contains the part most ready to decay, and is not fit for use for many building purposes; but the whole of the timber—sap and heart—is liable to decay if the conditions are sufficiently bad.

The compound material known as vegetable albumen abounds in the sap and is present in the sap-wood, and it is easily affected by damp and heat.

The albumen in the sap-wood is, perhaps, not the only material liable to decay, but it is the most prominent. When a tree is cut down in spring or autumn its pores are full of moisture; if felled in winter, and, I believe, in midsummer, it is less moist, but there is always a good deal of moisture. If the timber is exposed to the atmosphere the air will gradually dry up the moisture; if it is exposed to water the water will gradually dissolve out the albumen; and each of these processes is called *seasoning*. The smaller the scantling of the timber, the more readily will it part with its moisture; and for purposes where well-seasoned timber is required, the timber, after being squared, is stored in sheds protected from the direct rays of the sun (which promote cracks) and protected from rain, and yet open to the air, the logs not lying absolutely on one another, but separated by fillets of wood to allow the air free access all round. This is called natural seasoning. It is a slow process, but it has to be used for all timber intended for joiners' work, and for some of that intended for carpentry.

A good deal of the timber intended for carpentry is kept in water, and though it is not dried the albumen is more or less washed out of it. Sometimes, indeed, for this purpose logs are chained down under water. When actually brought on to the job or taken into the yard, timber out of a timber pond wants drying. The proper thing to do is to cut it as soon as possible into the scantlings and lengths required, and then to stack in the way I have described that the air may season it.

Seasoning is not merely drying. If that were so the wood could be baked and the end accomplished quickly; but though drying is no doubt part of the process it seems pretty certain that in order to be seasoned the timber must part with some of the material in its pores, or else that material must solidify, or else some antiseptic material must be introduced.

"The most effectual way to preserve good timber," says Mr. Laslett in his valuable book on timber, "is to partially season it in as natural a way as possible before working it up, and to give it that protection when brought into use which all other materials require to keep them from perishing. It should not be too soon varnished, painted, or coated with any preservative compound whatever, but be allowed to undergo after conversion a further short process of natural seasoning before this is done. Its durability will thus be ensured much more effectually than if desiccating, charring, or some other rapid process of seasoning has been resorted to for the sake of bringing it into earlier use after being fitted."

Mr. Laslett estimates the time required for natural seasoning as follows:—

|  | sq. in. |  | sq. in. | Fir. months. | Oak. months. |
|---|---|---|---|---|---|
| Pieces under | 8 | to | 4 | 3 | 6 |
|  | 12 |  | 8 | 5 | 10 |
|  | 16 |  | 12 | 7 | 14 |
|  | 20 |  | 16 | 9 | 18 |
|  | 24 |  | 20 | 11 | 22 |
| over | 24 |  |  | 13 | 26 |

Artificial methods of seasoning are in use, and McNeil's method I have seen in use at Messrs. Cubitt's, in Gray's Inn-road. Here the timber is enclosed in a cylinder; a furnace is kept burning at one end and the chimney is at the other, so that hot air and smoke are constantly passing over the timber from end to end, and there is water on the floor of the chamber which is constantly passing off in steam. The timber is thus in an atmosphere of hot, damp, smoky air, and three weeks of this treatment is said to suffice for timber of considerable scantling. The authorities state that all timber seasoned in these artificial ways becomes softer, which makes it easier to work but probably is accompanied by a loss of strength.

The air seasoning of deals and battens is to be seen going on in timber-yards everywhere. They are generally stacked level with fillets between the boards. Sometimes they are stacked sloping against a horizontal bar, but in any case it is essential that the air have free play all round them and very desirable that they be shielded from sunshine and from rain.

Pray remember that it is never safe to attempt to season sap-wood in any of these ways. For the construction of good buildings the sap-wood must be removed and the heart only made use of.

The result of seasoning is that the timber shrinks slightly, that it becomes lighter, that it increases very markedly in strength, and that, under reasonably favourable circumstances, it is safe not to decay.

Artificial modes of seasoning are employed on timber intended for railway sleepers which are not available for building timber. Sleepers which have to lie on the earth are often treated with creosote, a material distilled from coal tar, very antiseptic—that is to say, decay-resisting—smelling very strongly of tar, black in colour. In various ways it is attempted to force this into the pores of the timber, and though it does not seem easy to send it through the whole log, it is easy to fill the outside pores. This is generally done by putting the timber into a great iron cylinder, pumping out the air, and then letting the creosote in when the empty pores admit it.

The smell, of course, makes creosoting improper for timber used in a building, so other materials, such as a solution of corrosive sublimate, are occasionally employed, and among the methods which depend upon injecting chemicals into the pores of the timber attention has been directed to the one employed by the *Non-Flammable Wood Company*, which is said to render timber so far incombustible that it will not flame, though the company do not claim that it will not char if exposed to a flame. If it turn out that this treatment will make deal and pine wood, which is so convenient a material for the purposes of the builder, a fire-resisting material, and at moderate cost, it will be an immense boon; but the matter has hardly got, in England at least, far beyond the experimental stage yet, though it is claimed that the material is in actual use in America. We have, however, by the courtesy of the company, some specimens in the room, and can test their behaviour here and now.*

Timber, even though seasoned and put into a damp place, is liable to absorb moisture, which causes it to swell and twist, and if it is kept exposed to damp for a sufficeint time decay will follow. But, short of decay, the effect of moisture on well-seasoned wood, especially on joinery, is bad. The surface of wood that is likely to be exposed to changes of damp and dry air is accordingly protected by paint to keep the damp air from getting access to the pores of the wood; and if we desire not to paint, oiling, varnishing, treating with French polish, or rendering with pitch or tar are methods of closing up the cut surface of the wood more or less effectually; and this is the chief reason for painting joiners' work. The same object is proposed in the American preparation now before you. In extremely dry climates—for example, in Switzerland—you will find that it is not customary to paint or varnish woodwork to protect it, experience having shown that it is not needful, and much of the unpainted joinery has been exposed for many years, and is in good condition.

There are situations where timber is specially exposed. The butts of the posts in a timber fence are examples. It is customary to char these in a fire, and something of an impervious layer of carbonised wood is in this way secured to protect the timber from the effects of the moisture. It is possible also that charring may be of use in another way, to which I will direct attention immediately, by actually killing the seeds of fungus.

Suppose a piece of timber decays. What happens? I have already referred to the decomposition of any albumen there may be, and it is pretty certain that this becomes at once the soil in which low forms of life begin to flourish. They may be fungi of some sort. They may be bacteria. They will probably be both. But they will slowly appropriate to themselves not only the albumen most suitable for them, but almost everything else in the pores of the timber, leaving the bundle of empty tubes. In other words, the wood becomes light, spongy, and even will ultimately fall into powder, while it has lost all its strength. Old bond-timber taken out of walls shows this condition very markedly. The process seems in many cases to go on very slowly. It is prevented by a moderate circulation of air, and it can be checked and delayed by letting in air. This, which is most properly called decay, is commonly known as wet rot, and inasmuch as it is started by dampness more than by anything else, the term is not inappropriate.

### Dry Rot.

There is, however, a different aspect of decay in timber which is very formidable indeed, and is known by the name of dry rot. This name is not appropriate, for the dry rot appears, just as ordinary decay does, in positions when the timber is damp and no air gets to it. Dry rot is not a gradual decay, but a galloping consumption. It is rapid, it is complete, and it is apparently irresistible. It mostly begins in sap-wood, occurs in unventilated floors, is sometimes set up in boarded floors under kamptulicons and floorcloth, occurs in wood that has been painted when green, has been known to be started by pugging, and will, in any case, when once started, spread with frightful rapidity.

Dry rot is distinguished by the presence of a malignant fungus, which does the mischief. Signs of its presence are rusty rings round nail-heads, cracks in timber across the grain, a blistered appearance in the paint, mildew, fine long fibres forming a kind of network; then a thick, smooth fungus like the back of a mushroom of various colours, as white, greyish-white, violet, yellowish-brown, or rich brown; disagreeable acrid smell; till the timber loses all solidity and is rapidly destroyed.

Dry rot spreads with great speed, like a fire. When it occurs all wood affected must be cut out at once; all liable to be tainted or suspicious should be washed repeatedly with a solution of corrosive sublimate—1 oz. to a gallon of water—and air must be admitted freely. There does not seem to be any difference traceable between the conditions that produce dry rot and those that produce the slower and less malignant decay or wet rot, and one may conclude that the accidental presence of the seeds of one of the sorts of fungus which appear when an attack of dry rot takes place is the principal, perhaps the only, reason why this scourge shows itself in one place and not in another.

---

* A lecture delivered by Professor T. Roger Smith at Carpenters' Hall, June 1. Being the last of a short course on carpentry and joinery, intended for candidates preparing for the midsummer examination in these subjects established by the Carpenters' Company.

* Some simple experiments were tried with success in the lecture-room.

### PART II.—TIMBER BUILDING.

If now we suppose some such fabric as a stout quarter partition, well framed and braced, but without the studding, to be set up as the framework of an external wall, and to be boarded, or weather boarded, or covered with wood shingles outside, we have arrived at a suitable wall for a plain specimen of what forms the subject of the second part of our programme.—(Wooden Buildings).

Persons whose experience is chiefly in London have few opportunities of seeing wooden buildings, because they are contrary to the provisions of the Building Act; but I should remind you that the various railway companies who are exempt from those provisions which refer to the erection of buildings, make use of wooden buildings frequently, and in the country even more freely than in London.

At Reading I lately witnessed the demolition of part of the old Great Western station there, built of wood, and now replaced by a stone and brick building, on a different site. These wooden buildings must have been standing for more than fifty years, and did not seem, as they were being pulled down, by any means worn out.

In country places, in the Colonies, and wherever the laws or by-laws in force permit, I am of opinion that wooden buildings are better for temporary purposes than the very flimsy structures which we call iron buildings. These are mostly weak wooden frames covered with corrugated iron, and after a very few years are found to be beginning to need repairs and renewals, and a well-built wooden building, if kept painted outside, may be expected to outlast two—if not three—corrugated iron ones.

The liability to destruction by fire is pretty much the same in both cases. An iron building blazes up if it is set on fire as much as a wooden one does, and I am not sure that the frank confession which a wooden building makes of its being combustible is not useful as a warning to the people who make use of it.

Wooden houses of this sort are very much used and are liked in North America, where timber is very plentiful. A Mr. Moore, in a clever little book on "The House Practical," gives an account from which, and from other sources I will give some account of these buildings.

Mr. Moore says that it is the generally accepted opinion that the healthiest dwelling-house for the climate of America is a timber house and especially if near the sea shore. The summer temperature in America is, it is understood, higher than in England, and the winters are severe, so that if this good opinion is generally entertained it shows that a wooden house can be made tolerably weather-proof. It ought, however, to be added that it is the invariable practice to employ a heating apparatus to warm the house (usually by hot air) in addition to fireplaces in the rooms.

The structure of the outer walls of these houses is framed with corner posts extending from the sill or plate which is bedded on a brick or masonry dwarf wall to a plate at the top of the building. There are two modes of completing the framework, the best is what they call a braced frame; the other, a balloon frame. In a braced frame, a plate to which the name of girt is given is framed into the corner posts at the level of each floor. Some of those plates or girts, namely, those upon which the floor-joists are to rest, are placed at a rather lower level than those parallel to such joists, and to these the name of "dropped girts" is given, on account of their being fixed lower. At each angle made between the corner post and a floor-plate, short braces are introduced above and below to stiffen the angle, some diagonal braces are added in the longer lengths of framing, and then the remaining spaces are filled with upright studding, much as in an English quarter partition. The framing and studding of each story is thus, in effect, distinct. The chief difference between this and what it would be customary to do in England is in the insistence upon angle-ties, which are to be mortised and tenoned and pinned with hard wood pins. The timbers are to be "draw-bored" to receive the pins, which means that the hole bored through the tenon and the cheeks of the mortise do not quite coincide, and in consequence driving the pin home tends to draw the timbers tight together at the joint.

The other, and less strong, method is to form what they call a balloon frame. In this framing there are angle posts as before, but not girts, and all the studs are long timbers extending from cill to roof-plate. Timbers to perform the office of plates carrying joists are then spiked to the studs on the inside, or else are let into sinkings cut in the posts and studs, and the floor joists bear upon these plates. The framework is to be braced by long struts and interties, which, in the absence of precise information, I must presume are planted on the back or inner side of the studding.

It will be obvious that the first method provides for framing up to each floor, the second erects the walls from cill to plate, and then picks up the floors almost as if they were an afterthought.

The framework, whichever method has been followed, is now to be covered with its outer covering, and for this purpose it is first boarded with boarding in narrow widths (preferably not over 6 in. wide), grooved and tongued and wrought on one side; sometimes this boarding, which they term the sheathing, is fixed horizontally, sometimes diagonally. "On this outer sheathing should be fastened," says my authority, "a heavy quality of building-paper nailed with tin washers." I presume this building-paper is something the same as our Willesden paper. It is otherwise described as heavy "rosin-sized" building-paper—"not tar-paper"—and tin washers not less than ¾ in. in diameter are specified to be used with the fasteners.

Portions of the exterior may be faced with weather-boarding—here called clap-boards—but all the important part is to be covered with shingles, the thin slabs of hard wood which we sometimes employ for spires. The American writer recommends cedar to be used for the shingles; they are to be 16 in., of uniform size, "plane butts," clear of knots and cross-grain, and nailed with two galvanised nails in each shingle, "5 in. to the weather." This would, I believe, correspond to what we should call a lap of 6 in.

The roof may also be a shingle roof, with a sheathing of boarding covered with paper, like that on the walls, only that the roof shingles are specified to be nailed to fillets corresponding to our slate battens, in order to get a circulation of air between the shingles and the boarding behind them. The roofs otherwise may be slated on the boarding. The shingles may be either sawn or split. If sawn, they are most uniform in thickness; if split, most durable.

The finish of the internal face of both walls and ceilings is to be lathing and plastering, but it is recommended that either the spaces between the studs be filled with broken brick in mortar—like our brick-nogged partitions—or that a layer of rough plastering on laths on fillets be introduced in the middle of the partition. The American name for this, which in England is known as "deafening," appears to be "back-plastering." Mr. Moore very strongly deprecates the use of boarded ceilings, which it appears are customary, as dangerous in case of fire. The use of woodwork, in the shape of boarding and panelling, as an internal finish in place of plastering, is not even alluded to by him. It is common in wooden houses in Switzerland.

The scantlings of a good many of these timbers are given in the specification, and, on the whole, they are what we should consider rather light for timber in similar situations.

My American authority is fully alive to the risk of fire in a building of this nature, and not a few wholesome precautions are suggested and specified. The fireplaces, chimney stacks, and chimneys are of brickwork, and the timber are to be trimmed so as to avoid all contact with them, and all the flues are to be enclosed in 9 in. of brickwork. Precautions with regard to the hot-air apparatus, furnace-tubes, inlets, &c., I hardly need go into.

At each story the space opposite the joists, and for a short distance up each external wall, is to be filled in solid between all timbers with brickwork or mortar, or with mortar with a portion of plaster of Paris to harden it, and this filling in is to be plastered on both faces. This is for a fire-stop. Metallic lathing is suggested for the ceilings, and some description of fire-proof pugging between the floor and the ceilings.

It is also directed that the landings of the staircases are to have solid pugging between the joists that carry them, and that the spaces between the carriages of the same be closed at intervals of 3 ft. by fire-stops of some incombustible material, so as to prevent the possibility of the space between the back of the plastered soffits and the treads and risers acting as a flue to convey flames.

It appears to be intended that all external woodwork except the shingles shall be painted and the shingles either left with the actual surface and colour or stained.

Much such a construction as I have been describing, only more simple, would be of great use for the erection of agricultural cottages, stabling, and other buildings in parts of England where timber is cheap, and stone or brick not readily accessible. I am afraid that the by-laws of almost all the sanitary authorities created now in the country will prevent this being much done in the future, but here and there an opportunity of building wooden structures of this class occurs.

I now propose to say something about other kinds of wooden structures, those, in fact, which begin from the *log hut*.

In all countries where pines and cedars grow plentifully—that is to say, where trees which produce a timber that is straight and is easily worked, abound (in other words, in Switzerland, Norway, Sweden, and other parts of North Europe, and in the Himalayas and elsewhere in India)—timber is a favourite material for building, and what one may call *log walls* constantly occur. In Japan timber is largely used on account of the frequency of earthquakes, which throw down stone walls more readily than timber ones, but without attempting to describe the buildings in those remote countries I must say a word or two about those of Switzerland, a country which, thanks to excursions and Cook's tickets, is within easy reach.

No small part of the pleasure of a walk through the Bernese Oberland of Switzerland, for any one with an eye to good buildings, is due to the picturesque beauty of the timber-built houses known as chalets. They stand mostly on a foundation of rough masonry, and their walls are formed of logs of fir dressed so as to lie close one atop of another, and halved at the angles. The buildings are wide and low. The roofs overhang the walls at the sides a long way, and are thrown forward at the gables also on corbels of great strength, so as to shelter the walls; and charming balconies or verandahs are thrown out at the front and sides. The colour of the woodwork is generally very beautiful—a rich reddish amber is what is mostly seen, though some old houses become in time very dark indeed in colour. In these buildings, the art of building as practised in Europe long ago still lingers.

The enrichments and ornaments of these houses are often of great beauty. Bands of delicately-carved ornament, pierced panels, pretty balconies, with good carving in the brackets and the balustrades, abound, and the barge-boards of the great gables are often very well ornamented. Not infrequently an inscription records, the date of the building and the name of the worthy who caused it to be put up and that of his wife. Sometimes a text of Scripture, or a short prayer, or a quaint adage accompanies these, and I remember one in very crabbed German, the sense of which may be given in English much as follows:

> "Who builds upon the public way
> Must let the public say their say.
> I have built myself to please,
> And you can blame me at your ease."

The joints of these log-walls are carefully caulked with moss, and there is an inner lining of wood panelling or boarding. In Sweden, where the same sort of walling is largely employed, they slightly hollow the under side of each timber, and leave the natural curve of the wood on the upper side, so as to lodge them more tightly on each other, the timber being adzed down to a thickness of about 5 in.

In the Swiss timber houses when a cross-wall occurs the ends of the timber project in the front, as the logs forming the external walls are halved where it occurs. In Sweden this sometimes occurs. At other times timbers are halved at the angles of the building, and connected together by pegs of wood, and the broad end of one log is placed under the narrow end of the other, alternately. They sometimes set up stout angle posts with deep grooves in them, and form the walls of horizontal timbers, thinner than would be used for an ordinary log-wall, and carefully thinned at the ends to run in the grooves. They also sometimes use timbers placed vertically instead of horizontally. This seems to have been the case in Great Britain also (as Sir Gilbert Scott in his lectures describes). According to him a timber church, of considerable age, still stands, or stood a few years ago, at Greenstead, in Essex, of which the walls are built of stout logs, fixed vertically, with the original round face outside, though squared inside, and where they touch each other.

In Switzerland a very flat pitch and a surface unbroken by dormers and not disturbed by hips always occurs. The effect is one of breadth, not of height. In those Swedish and Norwegian buildings which aim at architectural effect—in the timber churches, for example—it is worth noting that exactly the opposite principle is adopted. The buildings are lofty, and are made to look lofty by the employment of steep sloping roofs and hips, and no better illustration can be given of the possibility of arriving at architectural success in the use of the same material by methods diametrically opposed to one another.

The kind of house which I have been describing is not, however, the only sort into which the employment of timber enters. Throughout our own country, France, Germany, and some other European countries, the kind of structure known as a half-timbered building was for many centuries universal, and it is largely in use now. By this title is meant a framework of timber filled in with plastering or masonry, or even tile work.

Very few English half-timbered buildings of great age remain. There are a few very old ones in French remote towns, and very picturesque they are. The early houses usually had side-walls of masonry and a gable to the street. Some of them are represented and described in the remarkable dictionary of Viollet le Duc. In some cases the scantlings are given by him. They do not seem very heavy, plates and posts being about 7 in. by 7 in.; but the total amount of timber is very great, as the timbers are very close together. The first floor overhung the ground floor considerably, but the joists ran parallel to the line of the front and are supported on the two party-walls and on one bressummer running from back to front and supported at the front by a stout post and by a carved bracket. The second floor, when there was one, might or might not overhang the first floor, but the roof almost always overhangs considerably.

Viollet le Duc gives in some detail the mortises and tenons and other joints employed in the example he illustrates. They are very elaborate, and, as he remarks, resemble those of a piece of joinery or shipbuilding.

Soon more skilful construction, and with more economy of material, came to be adopted, and the joists were often carried from front to back, instead of from side to side; but as far as my own observation goes, even when this is done, and when a story overhangs, the French builders did not show the joists as English carpenters, I think, preferred to do. The lower story post was framed into a deep head. The joists rested on this and were tenoned into a timber, which forms the plate for the upper framing, but the soffit of the joists is often covered by a third piece introduced more for ornament than use. The salient angle of all these is stop-chamfered or stop-moulded, and the effect is extremely rich and good. This method is not perhaps always pursued, but I have seen a good many examples of it, and it results in an effect so different from the appearance of English buildings which overhang that I feel it ought to be pointed out. During and after the fourteenth century the framing of timber houses was done with timber of comparatively light scantling and became very ornamental. As a rule the gable was turned to the street. The stories generally overhang, sometimes to a considerable extent, and in the best examples the prominent timbers are carved or enriched, sometimes with little pedestals and canopies and statues. The gable is often treated very skilfully with an ornamental barge-board; and where there is no gable a large and often beautiful dormer window takes its place as an architectural feature. In the fifteenth century, as people became more luxurious, these timber houses had wider frontages and several stories. It then became the custom to make the windows numerous and small, for it is impossible to avoid a certain amount of play under the alternations of hot and cold and the pressure of high winds in these great framings. This play, distributed among a number of small frames and casements, is less sensible than where there are only a small number of windows of greater dimension. Frequent cross-bracing and excellently-executed joints were also relied upon to keep the structure stiff.

Almost throughout the French examples the timbers employed are straight, with the exception of corbels and brackets and sometimes barge-boards. In England, on the other hand, frequent use is made of curved timber. Our habits as ship-builders may have to do with this, but I am inclined to attribute it to the quality of the timber available—chestnut—and especially the timber of *small* trees, which were chiefly employed in France for this sort of work, runs tolerably straight. Oak, which was the chief English timber, furnishes, with its gnarled and twisted branches, a great deal of curved timber not available for many purposes, but excellently fitted to form the curved struts which so often add to the beauty of our comparatively simple English framing, less often enriched with mouldings, carving, and statues than in France.

Among English examples, the halls in Cheshire and Lancashire were some of them important country houses, and the interiors, or, at any rate, parts of them, are extremely good; but I have thought it sufficient for our present purpose to confine myself to the exteriors.

There is no room to doubt that timber-framed buildings were in use—in common use—in this country in very early times. Ancient descriptions of buildings and pictures in early books show this. Of the many buildings of Saxon and Early Norman times, only the most sturdy have survived to the present day; in other words, only the best built stone ones. But some even of these give indirect evidence of the prevalence of timber construction. The famous Saxon tower of Earls Barton Church is covered with projecting strips, some vertical, like posts, some sloping, like struts, which precisely imitate the ornamentation of a timber-framing.

There are, however, a few examples of very respectable antiquity, and a great many that go back to the seventeenth, the sixteenth, and the fifteenth centuries. This kind of building was, no doubt, common in all towns. Specimens remain in most of those towns which were early established and have not undergone a complete and radical rebuilding. I have seen such, for example, in Chester, in Gloucester, in Worcester, in Tewkesbury, in Coventry, in Exeter, in Norwich, in Shrewsbury, and in Ipswich—and it would be easy to add to this list of towns. At a time when great forests of oak covered many parts of England which are now cultivated, timber was very available in many districts, and accordingly great country houses, manor houses, farm-houses—and now and then a church—were timber-built. Lancashire and Cheshire in the north are famous for their old halls, and it is only a small portion of these that are in masonry.

In the great forest-covered plains the houses were usually built in the picturesque black and white, half-timbered, style, oak being commonly used, not merely for walls and roofs, but also for the furniture and fittings.

In the older houses, as instanced by Tabley, Baguley, Smithells, and Samlesbury Halls, the timbers are generally of enormous size. A low stone wall usually carries the timber framing, which is often thrown into fantastic geometrical patterns. The panels so formed are filled in with a basket-work osier foundation, which is then daubed over with clay, strengthened with straw or stringy weeds. The finishing coat is of plaster on both sides, richly matted with hair, and frequently set back ½ in. or more from the face of the woodwork.

As an illustration of what is here said, the dimensions of some of the timbers at Baguley —dating apparently from the fourteenth century —may be cited. The head of the east doorway was cut out of a piece of oak nearly 3 ft. wide, many of the main posts out of pieces 2 ft. 6 in. wide, and others in proportion. These great timbers, it is added, are in excellent condition.

Such enormous timbers are, however, exceptional, and though the timbering is always heavy, the scantlings are not surprisingly stout; but the timbers usually stand very near together. The general arrangement was that the posts of a piece of framing, by which I mean all the upright timbers, were framed to a cill and a head, and that horizontal pieces like interties were framed into them, and that in some of the numerous rectangular panels so formed naturally curved timbers were added to enrich the panel, or else raking struts were used for that purpose. Occasionally an air of great ornament was given by the panels being filled with quatrefoils or other simple tracery. All this timbering is now black and may be supposed to have always been so, and the surface of the plastering is kept very white so that the ornamental parts stand out very vividly.

The gables commonly display a heavy tie-beam and a stout king-post standing on it with two heavy main rafters, while the two triangles so formed are filled by raking timbers. The roof-covering overhangs this, and there is often a barge board, while the face of the gable frequently overhangs that of the story below.

A curious variety exists at Tewkesbury, where the ornamental gables of two or three of the old houses are set rating forward. Of course, it is possible that on close examination this, like the famous twisted and leaning spire of Chesterfield Church, Derbyshire, might prove to be the result of decay; but as seen from below it has very much the air of being thus designed.

In some English town houses standing at the corner of a street a very stout corner-post of timber, of which the upper part is bent, was sometimes used, and caught the overhanging upper story. Some of these remain (at Ipswich, for example), though the house to which they belong has been entirely changed. Illustrations may be found in Parker's "Domestic Architecture."

There is a good deal of difference in respect of overhanging. In towns there was a great inducement to make the upper stories overhang so as to give more space. In country buildings it was sometimes done and sometimes not—and very often the upper stories of the gables overhang and the sides do not. It may have been the wish of the old builders to secure their gables to the main mass of the building by running the heavy joists, which they made use of, from front to back of each block of their buildings. When this was done you can quite understand that it is easy to make each story of the gable end overhang by simply letting the joists project beyond the plate on which they are supported and placing the cill of the next story on them; but that it would be less simple and secure to throw out the enclosing framework sideways and, accordingly, this constantly occurs.

A very pleasing arrangement of bay-windows in fronts of which the upper part overhangs sometimes occurs. There is a projecting square-faced bay on the lowest story, and on the next floor the entire front is thrown forward as much as the bay had projected, so that the general face of the first floor is a continuation of the face of the ground-floor bay. Sometimes this is repeated at a higher level, and with very good effect in tall fronts.

The most vigorous overhanging is that when the entire upper story of a town house is thrown out on posts, so as to cover over the whole footpath. This, which has a very quaint effect, is best seen at Chester, where, in addition, there is a second public footpath on the level of the first floor, reached by stairs at intervals. This peculiar disposition gives two stories of shops, and, of course, could hardly exist except where houses were timber-built. The name locally given to these overhanging buildings and the two stories of footpaths which they overshadow is The Rows.

In such examples as still remain in towns we rarely see such heavy and clumsy timbers as in the early country examples. The timbers are often lightened by being carved, or by having some sort of carved ornament added to them.

We have in London two remaining timber and half-timber buildings that show what the old build was. The front of Crosby Hall, Bishopsgate-street, has been very much renewed, but it shows in the main what the exterior of an ambitious and rather ornate

London building was. The other building, Staple Inn, on the south side of Holborn, nearly facing Gray's Inn-road, is happily almost untouched. It is very simple but very dignified, and is a most interesting example of considerable extent.

I spoke in the earlier part of this lecture about the use of whole timber buildings at the present day. A few words about the modern use of half-timbered work may be useful. It is unquestionably extremely pleasing in its effect, and the architects who build country houses are extremely glad to introduce a piece of half-timbered work here and there as a relief. We are, of course, anxious in modern houses to keep everything warm and dry, and I believe many architects now adopt the precaution, when they introduce a half-timbered external wall, of putting a thin brick wall behind it, and I judge this precaution to be wise. It gives two distinct walls, with something of an air space, and, in fact, has the same advantages to recommend it that a hollow wall has.

When this is not done, and even when it is done, there is great advantage (if the expense does not prohibit its use) in employing oak. It stands exposure to weather well, and does not decay or warp. Usually this will be out of the question, and the next best material is as resinous a sort of fir as possible, such as pitch pine, or what is known in the North of England as red pine.

It is important to groove the timber deeply, so that the plastering may go well into the groove, and behind this groove a fillet is nailed on to receive the laths.

Let me add that whenever you introduce half-timber walls for architectural effect, you must not be sparing of the timber. Your beams must be of large scantling, and not far apart, if you wish to obtain an effect at all resembling that got by the old builders.

When the work oversails, or where it is wanted to avoid weight, the brick backing may be inadmissible, and in that case I prefer lathing and plastering to boarding as a lining for the inside. If the inner face of the framing is boarded, I recommend two thicknesses of boarding, with Willesden paper between the two, as much more likely to stop the wind that may get through crevices than anything single.

If there is not a backing it would be very desirable to fill the spaces of the framing with some light non-conducting material. In Sweden I believe that dry moss is used for this purpose, but it is hardly safe to attempt its use in England. We have an admirable and perfectly unexceptionable material in slag-wool (otherwise silicate cotton), but unfortunately it is not cheap, and could only occasionally be used. Probably the best thing to use would be deafening, such is often used in internal partitions, and though I have no experience of its employment in such a position, I should not hesitate to use it were the occasion to arise.

In conclusion, I make no apology for directing your attention in parts of this lecture—one of a course intended for practical men—to buildings on the Continent and in America, as well as in England. We seek after *novelty* in building as in other arts, and we are more likely to find what is new if we ask what the builders in other countries, and with different climates and surroundings, do than if we look only at home. We also seek for *improvement* and if we are only willing to learn, we sometimes can get a valuable lesson from the mere fact that the thing we are about is done in a different way by other people. I trust, therefore, that you will always keep your eyes and ears open to the work being done by our American brethren and by the many clever men on the Continent, whose architecture and construction has been in the past, and is often now, of the very greatest excellence.

◆

INFIRMARY, &c., CAMBERWELL.—At a meeting of the Camberwell Guardians on Friday, last week, plans, prepared by Mr. Edwin T. Hall, architect, Moorgate-street, E.C., were approved for the infirmary, Guardians' offices, and relief station at an estimated cost of 208,000*l*.

LEEDS ARCHITECTS AND THE BUILDERS.—A resolution has been passed by the Council of the Leeds and Yorkshire Architectural Society approving the action of the Leeds Masters' Federation in the building trade dispute, and promising to urge upon their members the desirability of recommending clients not to put pressure on employers to fulfil their contracts, during the continuance of the dispute, or to let further contracts.

## THE ARCHITECTURAL ASSOCIATION SUMMER VISITS.

THE second summer visit of the Architectural Association was to have been to Gatton Park, in Sussex, on Saturday last, the 17th inst., but it was abandoned, and as only nine members had expressed a wish to attend, it was decided to make an informal visit elsewhere.

A small party of six in all went down to Lingfield Station, on the L.B. and S.C. Railway. The large and interesting church—mainly Perpendicular—was first inspected. The two gables at the east end are without copings, the roofs projecting as at the eaves where the stout plate and ends of rafters are visible, grouping well with the shingled spire on the low tower, which breaks on plan into the west end of the south aisle. The windows, on the north especially, are high from the floor, which is of stone except in the choir and chapels, where the old red bricks, 9 in. by 9 in., remain. The oak screens are good, but not elaborate; against the central one are returned choir stalls with carved misereres, the church having been made collegiate in 1431 by Lord Cobham, whose tomb exists, with his recumbent effigy, and a Moor at his feet. There is also a larger tomb to another Lord Cobham and his wife; they have at their feet a griffin and a wyvern. Both these tombs have their ends and sides carried up above the top about 3 in., and are battlemented; there is also a fine altar tomb with moulded purbeck marble slab with a brass of a knight in plate armour, and inscription dated 1403. The old oak lectern carries a seventeenth century Bible. The walls are whitewashed and the roofs are of the waggon type of dark oak.

Near the church is a fine old timber-framed house with half-timbered cove between wings which project beyond the wall of the ground floor, also an early Georgian house of brick with plain wooden mullions and transomes. On the village green is a diminutive mutilated chapel or shrine known as "St. Peter's Cross," which until recently has done duty as a lock-up.

An adjournment was then made to Crowhurst-place, an old Tudor house of very great interest. A portion of the moat still remains; the house and adjacent buildings—for it is now a farm—form as picturesque a group as can well be imagined. Through the kindness of Mr. Hooper, the members were allowed to go all over the house, a courtesy which was much appreciated by them. The hall has an open timber roof of solid construction, which was inspected from the ceiling joists of the three bedrooms which have been inserted. The spacious fireplace still contains its original fittings and fire dogs, as also a cast iron fire back of the seventeenth century, and the walls are wainscoted. The screen has disappeared; the parlour is now used as a lumber-room; its walls are covered with fine linen-fold panels in oak. The ceiling has heavy moulded beams and rafters, the boards between being painted in red and white checkers, these colours being repeated on the beams, and the hollow member in blue, enriched with small lead stars originally gilt; the colours are faded but perfectly distinct. The cornice has disappeared; it was described in 1858 as still existing, "A Gothic G alternating with grapples in blue and gold on a crimson ground." This was the badge of the Gaynesfords, the original owners, and occurs on the quarries in one of the windows. The outer doors are richly moulded, and good hinges are to be noted both here and upstairs; notably two pairs, of small fleurs-de-lys patterns.

The next move was to Crowhurst Church, St. George's, with a very old yew tree in the churchyard. Here the members of the party were met by the Vicar, who kindly conducted them over the church, which is small, of the Early English and Perpendicular periods; it contains two altar-tombs, and brasses to members of the Gaynesford family 1450-60. The stout oak posts that carry the belfry come down to the nave floor at the west end. A wooden battlemented cornice on the north wall of the chancel, below the sill of the window, is supposed to have formed the capping to wainscoting now missing. A cast-iron grave slab on the chancel floor, dated 1591, also attracted notice. The members then adjourned to a farmhouse close by, dating from the sixteenth century and once belonging to the Angell family; it is now in the possession of Mr. and Mrs. Williams, who most hospitably entertained the party with an excellent tea. The deeply recessed open fireplace and huge chimney has *in situ* a very fine mechanical appliance of wrought iron worked by a weight for turning the spit. Returning to Lingfield Station and by rail to London brought this impromptu and highly successful visit to a close.

We may here mention that in the account of the visit of the Association to Cobham Hall, the statement that the house was illustrated in Messrs. Belcher & Macartney's "Later Renaissance" was incorrect; it is in Mr. Gotch's "Renaissance in England" that the illustrations referred to are to be found.

◆

## THE ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

A NORTHERN COUNTIES district meeting of the members of this Association was held at Whitehaven on Saturday last. Mr. R. H. Dorman, of Armagh, presided in the absence of the President (Mr. Robson), and amongst those present were Messrs. E. J. Silcock, Leeds; J. F. Smillie, Tynemouth; R. Pickering, Whitehaven; J. S. Brodie, Whitehaven; J. P. Dalton, Ryton-on-Tyne; J. T. Redfern, Carlisle; and J. B. Wilson, Cockermouth.

The Mayor (Alderman J. R. Musgrave), in welcoming the members to Whitehaven, remarked that they might have been attracted there by the knowledge that, although a small borough, it had led the way in a great many notable matters which affected the welfare and health of the community. It was the first town in England that ever adapted a natural reservoir to the purpose of a water supply, and they could claim to be the first borough in England to light their streets and attempt private lighting by electricity. Those matters had been eminently satisfactory to them in Whitehaven. Although an old town, with a dense population aggregated on a small area, they could hold their own with any part of the country in respect of the public health.

Mr. Dorman thanked the Mayor for his reception of the Association and for the use of the Town Hall for their meeting.

On the proposition of Mr. Brodie, seconded by Mr. Pickering, Mr. J. P. Dalton, Ryton-on-Tyne, was re-elected hon. sec. for the district.

Mr. R. Pickering, Whitehaven, read a paper on "Water Supplies to the Incorporated Boroughs and the Urban and Rural Districts of West Cumberland." He said the rainfalls in the mountain ranges of Cumberland were enormous, reaching in one part and in some years to 250 in., and toning down to 58 in. on the margins of the mountain district. The waters of the western mountains, in their passage through the lakes and rivers, contributed of their stores, and almost entirely supplied the population on the western seaboard, and they were without exception uniformly very soft and very pure. The Whitehaven supply was obtained from Ennerdale Lake, from which the town was authorised to draw one million gallons a day and at the present time a Bill was before Parliament to increase the daily draw from the lake to 2,000,000 gallons. Up to the present time the sum of 93,000*l*. had been authorised to be borrowed by the various Acts, and 78,000*l*. had been expended. In 1866 the Maryport Authorities obtained Parliamentary powers to take water from a mill race at Cockermouth, which was fed exclusively from the waters of the River Derwent. The source was not at present first class, yet it was of such quality that the inhabitants of scores of towns would be very glad indeed to be supplied from it. A series of filter beds had been made in Bridekirk, at an elevation of about 368 ft. above O.D., and a covered service reservoir in Ellenborough. The works supplied a total population of about 18,000, and the capital expenditure was 33,450*l*. The Willow water supply was from the head waters of Whicham Beck, where the watershed area had only about two or three dwelling houses within its area. The reservoir capacity was 28,000,000 gallons. The daily consumption was 650,000 gallons, or 65 gallons per head. The main pipe from the reservoir to the town was laid in 1875, of 8 in. diameter; in fifteen years it was found to be so crusted with peroxide of iron that the district could not get enough water through it, and in consequence of this about two-thirds of the 8-in. main was taken up and replaced by a new 12-in. main with a breeches piece; then there were two 8-in. mains at the Willow end. The old 8-in. pipes, after being scraped, were relaid, besides the one-third of the length which was not disturbed, but was scraped *in situ*. The capital expenditure amounted to about 30,000*l*. The gathering ground of the water supply of the Cleator Moor district was on the slope of the Dent mountain, closely contiguous to the district, on which two reservoirs were constructed, but subsequently the district went further afield on the mountain country betwixt the old gathering ground and the Kinniside mountains, taking the water from sundry springs and making a new service reservoir. The expenditure had been about 23,000*l*., and the Council was carrying out the laudable principle of paying off the debt rapidly. The district of Arliedon and Frizington, soon after its formation into a Local Board in 1876, constructed water works in Cogra Valley at the level of about 700 ft. above O.D. There was a very strong spring in this valley of peat moss of good quality water, but varying with the seasons. Instead of making provision for storing this pure spring water, they made a storage reservoir in a swamp, to about 20 ft. in depth of peat below it, and in dry weather drew on this bog reservoir. In the years 1878-9 the Arliedon Local Board tempted the Egremont Board with an offer that they would supply them from their works at Cogra Moss with water at 1½d. per thousand gallons, and an agreement was entered into. In 1879 the Egremont Local Board applied for an Act of Parliament to make an impounding reservoir in Uldale. This reservoir was to do duty also as a service reservoir, the site being only 1¾ miles from the edge of the Egremont district. The site chosen for the dam had slate rock at both edges and rock below, but the narrow neck of the valley had about 60 ft. depth of dèbris on the rock. It was an ideal water-shed, without any pollution present or likely. A fierce battle took place before a Parliamentary Committee on the petition of a lord of the manor of about one-half of the water-shed area. He was worsted in his contentions, and the Act was obtained containing the most important provisions. By the tempting offer of the Arliedon Local Board to supply Egremont with water at 1½d. per thousand gallons, the latter Authority actually threw overboard the important privileges they had obtained in the Uldale valley by authority of Parliament. This was one of the many instances where committees make sad mistakes. The individual members often fancy they are competent to deal with every question under the sun. At a public inquiry before a Local Government Board Inspector on the application by the Egremont Board for a loan to lay pipes seven miles to bring the Cogra water from Lamplugh and the other necessary service mains, as well as to erect a small service reservoir, one of the witnesses in opposition contended that the large reservoir in Cogra was a perfect "*muck hole*." This evidence gave much offence, but the loan was sanctioned by the Local Government Board. The works have been carried out, and now for the last three or four years the Egremont Board would be glad to be set free from their engagements with the Arliedon Council on the ground they say that the water is "*cheap and nasty*." In the Bootle Rural District three small waterworks had been carried out for Bootle parish, Whicham and Hill-on-Millom respectively. On each of these installations a principle had been adopted to have the works so constructed as to be nearly self-supporting by water-rents, without taking outlying property where owners and occupiers would not derive any direct benefit. A joint scheme for the Cockermouth Urban and Rural Districts and Workington was carried out by a Joint Committee of the three Authorities, who, after several abortive schemes were considered, turned their attention to the Crumwick Lake watershed of 15,600 acres with annual rainfall of from 55 in. to 120 in. per annum and having regard to its wide expanse, the water was found to be relatively free from impurity. The salient points of the scheme which was adopted were power to lower the bed of the Cocker below its exit from the lake and to erect weirs across the two arms of the river Cocker as it issued from the lake, but so as not to raise the normal level of the water in the lake; to draw off 2,000,000 gallons of water per day, and in the event of a 15-in. diameter pipe being laid down to draw from the lake to give 3,000,000 gallons per day as compensation to the river, and in the event of a larger pipe than 15 in. in diameter then the compensation water to the river was to be increased to 4,000,000 gallons. The capital cost of the works was about 32,000*l*. Workington's population had so increased that it had this Session a Bill in Parliament, the object of which was to raise Lake Crummock 2 ft. and to lay a new main pipe of 21 in. diameter as a service main, as well as the probable construction of two service reservoirs. In summing up Mr. Pickering expressed the opinion that considerable reform was necessary in the procedure of the Local Government Board. They were so opinionated and dogmatic in their requirements that instead of helping on the sanitation of a district, they obstructed and delayed, giving no credit to country opinion.

Mr. J. S. Brodie, Borough Engineer, read a paper on some public works at Whitehaven. With reference to the waterworks, he said the supply was one of the purest and softest in the Kingdom, and was practically inexhaustible. The Corporation were this year promoting a Bill in Parliament which sought to increase the limits of supply up to 2,000,000 gals. per day, as it was found, in the absence of large storage reservoirs, that the maximum of 1,000,000 gals. was insufficient to meet the demands for all purposes during a long-continued drought. The electric lighting order was obtained in 1891, and there were now the equivalent of 8,727 eight-candle-power lamps connected for public and private lighting. The average selling price was 4d. per unit. From the very commencement the electric lighting undertaking had been financially successful, while the unbroken continuity of the supply had left nothing to be desired. The harbour works were under a separate Board of Commissioners. The west and north piers were completed in 1830 and 1843, and the wet dock, known as the Queen's Dock, with an area of 4½ acres and a depth on sill of 22 ft. at high water of spring tides, in 1876. The sewerage works were carried out by the late Mr. Hawksley, and the sewage discharged into the sea about 650 yards south of the harbour. The outfall sewer was provided with double-flap valves, so that the flow tide, which set northward towards the harbour entrance, closed the valves and prevented the sewage from discharging, and the ebb tide, which set southward towards St. Bee's Head, allowed the valves to open, releasing and discharging the sewage into the sea at low-water mark.

Mr. Dalton, Ryton-on-Tyne, moved a vote of thanks to the readers of the papers, which, he said, would be of great value and useful as works of reference in the future.

Mr. Smillie, Tynemouth, who seconded, said he had been struck by the contrast which the towns on the north-west coast presented to his district on the north-east coast. Here the inhabitants had to go only a short distance for a copious supply of water, drawn from a natural reservoir, and the cost had been comparatively low, say 50,000*l*. for 1,000,000*l* gallons. In Tynemouth they had been reduced almost to the state of a water famine, and now that they had broken the bonds which held them to a company, they had to go twenty-five miles distant for their water, and the cost would be from 100,000*l*. to 150,000*l*. Whitehaven was also to be congratulated upon the favourable position of the electric lighting undertaking, because, although Mr. Brodie had not told them what it was yielding, he was assured it was relieving the rates to the extent of 600*l*. per annum. The position of Whitehaven with respect to water supply and electric lighting said much for the enterprise of the Corporation and the efficiency of the officials.

Mr. E. J. Silcock, Leeds, said that with experience in Yorkshire, where watersheds were so taken up as to be getting very scarce, it was refreshing to visit Cumberland, and to find the people could use sixty-five gallons of water per head per day. It struck him that, with a supply of 1,000,000 gallons per day, Whitehaven ought not to have to seek a further supply of water.

Mr. Pickering and Mr. Brodie having replied, the vote of thanks was accorded.

The Mayor entertained the members to luncheon, and the afternoon was devoted to a round of visits to the electric light works, the reservoir, and the harbour.

## METROPOLITAN ASYLUMS BOARD.

Sir Edwin H. Galsworthy, the chairman, presided on Saturday at the fortnightly meeting of the Managers of the Metropolitan Asylum District, at the County Hall, Spring-gardens.

*North-Eastern Hospital.*—The amended plans prepared by Messrs. A. & C. Harston, architects, for the erection of a new laundry, with temporary boiler and engine-house and rain-water reservoir, at the North-Eastern Hospital, were approved and adopted. The matter was dealt with in our report a fortnight ago.

*Millfield Homes.*—Mr. H. Howard, Surveyor to the Urban District Council of Littlehampton, was appointed to prepare plans and specification for the protection of the sea-front of the Board's property at Rustington and to supervise the execution of the work.

## THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday at the County Hall, Spring Gardens, Lord Welby, Chairman, presiding.

*Loans.*—On the recommendation of the Finance Committee it was agreed to lend the Fulham Vestry 25,000*l*. for electric lighting purposes; the Lee District Board 2,480*l*. for paving works; the Limehouse District Board 4,120*l*. for street improvements; the St. James's, Westminster, Vestry 3,200*l*. for paving works; the St. Margaret and St. John, Westminster, Vestry 12,700*l*. for paving works; and the Central London Sick Asylum District Managers 27,440*l*. for provision of an asylum at Hendon.

*List of Rates of Wages and Hours of Labour.*—The same committee reported as follows, the recommendation being agreed to:—

"The rate of wages inserted in the Council's list for slaters is 9d. per hour, and the hours are stated as fifty in summer and forty-seven and forty-four in winter, but the London Slaters' and Tilers' Union state that the rate should be 10d. per hour and the hours fifty-three all the year round. We have ascertained that there is no agreement between employers and employed on the subject, and we think that in view of this, and of the fact that slaters are not directly employed by the Works department, the better course would be to omit all mention of slaters from the Council's list. If this were done the regulation would come into operation under which contractors for the Council have to pay the rates and observe the hours in practice obtained in London. We recommend that the trade of slaters be omitted from the Council's list of rates of wages and hours of labour."

*Chief Assistant Architect.*—The following urgency report of the Establishment Committee was then considered:—

"The consideration of the paragraph in our report presented to the Council on the 13th inst., with reference to the retirement of Mr. Hebb, was adjourned so that we might have an opportunity of discussing the matter with the Building Act Committee so far as the recommendations affect the work of that Committee. We stated in our previous report that Mr. Hebb entered the service of the Metropolitan Board of Works in February, 1877, at the age of forty-two, as assistant architect and surveyor in the Building Act office. His work has therefore been intimately connected with that of the Building Act Committee, and that Committee are strongly of opinion that having regard to the fact that the superintending architect has only been in office a few months, Mr. Hebb's retirement at the present time would cause serious inconvenience to the public service. We concur in the views of the Building Act Committee, and accordingly recommend—

(*a*) That as the retirement of Mr. J. Hebb would cause inconvenience to the service, he do continue to hold his appointment for another year as from August 20, 1899.

In the event of the above recommendation being adopted there is still the question referred to in our report of the 8th inst. of the appointment of an assistant architect for general duties. The Architect has pointed out the great increase of work in the department, and he feels that as the duties of Mr. Hebb are practically confined to the Building Act work, which we may add has nearly doubled since 1897, it is desirable that he should have the advantage of a chief assistant, who should not be engaged for the work of one particular branch. Although recommending the retention of Mr. Hebb for another year, we feel justified, having regard to the large increase generally of the work of the department, in still asking the Council to at once take steps for the appointment of a new assistant architect, at a salary of 800*l*. a year. We accordingly recommend—

(*b*) That an advertisement be issued inviting applications for the appointment of an assistant architect, and that the salary attached to such position be 800*l.* a year."

Recommendation (*a*) having been agreed to,

Lieut.-Colonel Ford moved that recommendation (*b*) be adjourned until after the summer vacation. It was, he said, scandalous that such a proposal should be made.

Mr. Balian seconded.

Mr. Corbett, Chairman of the Committee, quoted figures to show how largely the work of the Architect's Department had increased in recent years, and how great was the need for further assistance.

The amendment having been lost,

Mr. Parker moved, and Mr. Howell J. Williams seconded, that the recommendation be referred back for further consideration and report.

This amendment was also defeated by a large majority, and subsequently the recommendation of the committee was carried.

*Fire Station, Islington.*—On the recommendation of the Fire Brigade Committee it was agreed that the estimate of 14,400*l.* submitted by the Finance Committee in respect of the erection of the new Islington station in Upper-street be approved; that the Council do sanction an expenditure for the work of erecting the station of 14,033*l.* 14s. 3d., in addition to 95*l.* for stoves; that the work be executed by the Council without the intervention of a contractor; and that the drawings and specification be referred to the Manager of Works for that purpose.

*Delay in Obtaining Approval of Plans of Working-Class Dwellings.*—The Housing of the Working Classes Committee recommended, and it was agreed, that a communication be addressed to the Local Government Board pointing out the grave inconvenience caused to the Council in securing the erection of dwellings under the Housing of the Working Classes Act, 1890, by delays that occur in obtaining the decisions of the Board upon plans of such dwellings submitted to them.

*Brook-street, Limehouse, Scheme.*—The same Committee also recommended, and it was agreed, that the amended tender of Messrs. Leslie & Co., amounting to 4,423*l.*, for the erection of cottages on plot II., Brook-street, Limehouse, scheme, be accepted; and that standing order No. 195 be suspended so that advances to the extent of 80 per cent. of the value of the work done by Messrs. Leslie & Co. in erecting the cottages may be made.

*Battersea Park Lakes.*—The Parks and Open Spaces Committee reported that by the present system of supplying the Battersea Park lakes with water from the Thames too much mud accumulated, which necessitated frequent cleansing at considerable cost. They proposed now to use a well and pumping apparatus, and recommended "That the Council authorise an expenditure of 3,654*l.* for carrying out a scheme to supply water to the lakes in Battersea Park, by pumping the same from the well in the park, in accordance with the specification prepared by the Engineer; and that the work be carried out by the Council without the intervention of a contractor, and that the quantities and specification be referred to the Manager of Works for that purpose."—This was agreed to.

*Nelson Recreation Ground: Railings, &c.*—The same Committee also reported that the Council, having, on July 5, 1898, authorised the expenditure necessary for completing the work of laying out the Nelson recreation ground, and the Works Manager having reported that he was not satisfied with the estimate for the erection of new boundary railings and gates, they in due course advertised for tenders. The following tenders were received:—Faulkner & Sons, 437*l.* 15s. 8d.; General Builders, Limited, 526*l.*; G. Munday & Sons, 585*l.*; Fane & Co., 623*l.* 17s. 4d.; E. J. Raybould & Co., Limited, 624*l.* 3s.; E. Coules & Son, 688*l.* 7s. They recommended that the Council do accept the tender of Messrs. L. Faulkner & Son to erect for the sum of 437*l.* 15s. 8d. certain boundary railings, gates, &c., at Nelson recreation ground, in accordance with the specification prepared by the architect. This was agreed to.

*Technical Education.*—On the motion of the Chairman of the Technical Education Board, it was resolved: "That the Council do accept the offer of the Trustees of the Sydenham Public Lecture Hall and Institute of the building and adjacent property with the view of a Technical Institute and a day-school for girls being established on the premises; that steps be taken to vest the property in the Council on the terms of the trust; and that the matter do stand referred to the Technical Education Board, with instructions to carry out the trust as part of its work under the Technical Instruction Acts, 1889 and 1891."

*St. James's Hall.*—The Theatres and Music Halls Committee reported:—"For a long time past our attention has been drawn to the desirability of requiring considerable alterations to be made at St. James's Hall, Piccadilly, in order to render the large hall, minor hall, and banqueting room at these premises suitable for the public entertainments that take place in them. In 1885 the Metropolitan Board of Works served a sealed notice containing thirty requirements on the owners, and these were complied with in 1886. After very careful deliberation we some time ago drew up a list of matters which in our opinion required attention in order to remedy the existing defects in the building. We forwarded a copy of them to the owners of the premises for their information, and we have since conferred with their architect on the subject, and we now submit a list of requirements which we think should be complied with as soon as possible, having regard to the public safety. It has been urged on behalf of the owners of the hall that the widening of Piccadilly, which the Improvements Committee have under consideration, will affect these premises, and that the suggested requirements should therefore remain in abeyance until the question of the improvement is settled by the Council. This improvement was not included in the list presented to the Council on Tuesday last, and it is possible, therefore, that a long time may elapse before any definite action is taken in regard to it. We recommend "that a notice under the Metropolis Management and Building Acts Amendment Act, 1878, containing the following requirements in regard to St. James's Hall, Piccadilly, be prepared by the solicitor."

This was agreed to. There are twenty-nine requirements.

*St. James's Theatre.*—Eight plans in regard to certain alterations at this theatre were also approved.

The Council adjourned at 6.30 o'clock.

## *ARCHÆOLOGICAL SOCIETIES.*

Anthropological Institute.—At the meeting of this Institute held on the 13th inst. Mr. George Clinch, F.G.S., read a paper on "Prehistoric Man in the Neighbourhood of the Kent and Surrey Border: Neolithic Age," in which he detailed a number of discoveries he had made during the past twenty years or so in the parishes of Hayes, West Wickham, Keston, Addington, Croydon, and Sanderstead. The remarkable series of neolithic settlements he has discovered have a special importance, from the fact that the hut-floors he has uncovered may be considered to be the very first efforts of pre-historic man in the direction of building an entirely artificial shelter for himself and his family. Particulars were given of several different neolithic settlements, indicated by the occurrence of circular dish-shaped depressions—the floors of dwellings—and several cooking hearths. The dwellings had been somewhat like the bee-hive huts of Cornwall. They show, as might be expected, great simplicity of plan and a very elementary domestic arrangement.

## *COMPETITIONS.*

Technical School and Free Library, Leamington.—Nine sets of plans have been received from competing architects. The committee have unanimously recommended—(1) That the plans marked "A" be awarded first premium; (2) that the plans marked "C" be awarded second premium; (3) that the author of the accepted plans "A" be requested to modify the exterior design by the substitution of face brick and stone to the satisfaction of the Council; (4) that the plans marked "D" and "E" receive honourable mention.

Concert Pavilion, Dover Pier.—In the recent competition for designs for a concert pavilion to be erected on Dover Promenade Pier, the directors have selected the joint design of Mr. M. Noel Ridley, A.M.Inst.C.E., and Mr. Robert J. Beale, A.R.I.B.A., of Westminster. The directors have also adopted a report by the same authors on the strengthening of the pier, and given instructions for the working drawings, &c., to be proceeded with.

Congregational Church, Seacombe.—In a recent limited competition for a Congregational Church to be built at Seacombe, Birkenhead, at a cost of 2,700*l.*, the plans of Mr. F. W. Dixon, of Trevelyan-buildings, Manchester, have been accepted, and he has been instructed to proceed with the work at once.

## APPLICATIONS UNDER THE LONDON BUILDING ACT, 1894.

At the meeting of the London County Council on Tuesday, the following applications under the London Building Act, 1894, were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated.

### *Formation of Streets at Plumstead Common.*

*Woolwich.*—That the resolution of the Building Act Committee of July 25, 1898, acting on behalf of the Council, sanctioning, on the application of Mr. A. Dwyer, on behalf of Mr. H. N. Grenside and the Rev. J. McAllister, the formation of new streets to be named Timbercroft-lane (in continuation), Flaxton-road, Melling-street, Malton-street, Kirkham-street, and Pedlar-street, respectively, to lead out of Swingate-lane and Timbercroft-lane, Plumstead Common, be rescinded so far as it relates to the proposed street marked Pedlar-street (Messrs. McAllister and Grenside).—Agreed.

### *Lines of Frontage.*

*Fulham.*—One-story shops upon part of the forecourts of Nos. 83, 85, and 87, North End-road and No. 1, Beaumont-crescent, Fulham, and the erection of a block of flats, with one-story shops in front, on a site between No. 83, North End-road and Beaumont Mansions (Mr. J. P. Flew, jun.).—Consent.

*St. Pancras, West.*—A building on the north side of Hawley-crescent, St. Pancras, at the corner of Kentish Town-road (Messrs. W. Bradford & Sons for the Camden Brewery Company, Limited).—Consent.

*St. George, Hanover-square.*†—The retention of two wood and glass showcases attached to the projecting stone columns placed on each side of the entrance to No. 23a, Old Bond-street, St. George, Hanover-square (Mr. W. Wallace, for Messrs. Langfier, Limited).—Refused.

*Westminster.*—Three oriel windows in front of a proposed block of buildings on the site of King's Head-court, and Nos. 5 to 10, Broadway, Westminster (Mr. J. A. J. Keynes for Mr. W. Bramley).—Refused.

### *Width of Way.*

*Strand.*—Dwelling-houses, to be inhabited by persons of the working class, on the south side of Drury-lane, St. Martin-in-the-Fields, with the east wall at less than the prescribed distance from the centre, and to exceed in height the width, of a proposed extension of Martlett-court (Mr. W. E. Riley, for the Housing of the Working Classes Committee of the Council).—Consent.

*Stepney.*†—Dwellings on the site of Nos. 1, 2, 3, 4, 5, and 6, Union-street, Mile End-road, to an advanced line of frontage (Messrs. J. Hood & Sons for Messrs. D. & M. Cohen).—Refused.

### *Formation of Streets.*

*Wandsworth.*†—That an order be issued to Mr. C. Dunch refusing to sanction the formation or laying out for carriage traffic of a new street to lead from Streatham High-road to Streatham Common South, Streatham (for Mr. M. H. Voss).—Agreed.

### *Width of Way, Cubical Extent, and Construction of Building.*

*Deptford.*—An addition to an iron building on the north side of Blackhorse-road, Deptford, with the boundary or fence in front of such addition at less than the prescribed distance from the centre of the road (Messrs. Humphreys, Tennant, & Co., Limited).—Consent.

### *Line of Frontage, Width of Way, and Space at Rear.*

*Walworth.*—That the Council, in the exercise of its powers under Sections 13 and 22 of the London Building Act, 1894, do consent to the position and frontage of a building, with two oriel windows, to be used as a working men's club, on the east side of Walworth-road, Walworth, at the corner of York-street, and that the Council, under Section 41 of that Act, do permit the erection of such building with an open space at the rear (Messrs. Spalding & Cross for Mr. Arnold Pye-Smith, J.P., and the Committee of the Robert Browning settlement.—Agreed.

### *Deviation from Certified Plan.*

*Whitechapel.*—Certain deviations from the plan certified by the district surveyor, under Section 43 of the London Building Act, 1894, so far as relates to the proposed re-building of No. 83, Whitechapel High-street (Mr. J. Hamilton for Mr. W. R. Sutton).—Consent.

### *Buildings for the Supply of Electricity.*

*Bow and Bromley.*—A deviation from the plans sanctioned on April 25, 1899, for the construction of an electric lighting station and works on a site at the corner of Glaucus-street and Yeo-street, Bromley, so far as relates to the erection of the chimney-shaft (Mr. O. E. Winter for the Poplar District Board of Works).—Consent.

### *Means of Escape from Top of High Buildings.*

*Strand.*—That Messrs. H. L. Florence & L. H. Isaac be informed that the Council, in the exercise of its powers under Section 63 of the London Building Act, 1894, is prepared to grant a certificate in respect of the means of escape in case of fire to be provided for the persons dwelling or employed on the fifth and sixth floors of the Carlton Hotel, Pall Mall, St. James's (for the Law Guarantee and Trust Society).—Agreed.

*The recommendations marked † are contrary to the views of the Local Authorities.*

## THE BUILDING TRADE DISPUTE.

THE members of the National Association of Operative Plasterers resumed work throughout the country on Monday. The dispute began in February, so that it had been in existence about four months. It is stated that the terms of settlement have given satisfaction to both sides, and there is every reason to hope and believe that as soon as matters are got into working order general peace will reign in the plastering trade for a considerable time to come.

At a meeting of the Northern Centre of the Master Builders' Federation, held in Leeds on the 14th inst., a resolution was passed approving the suggested National Conciliation Board for the building trade, but declaring that steps must first be taken to clear up the matters contained in the Yorkshire Masters' manifesto. It was proposed that a conference of the Yorkshire masters and trades-union representatives be arranged for, in which case the lock-out of twenty-five per cent. would be withdrawn.

A meeting of representatives of the trades-unions chiefly affected by the present dispute was held on the 19th inst. in Manchester. A week previously these representatives met and drew up a basis for a joint conference in the establishment of district boards of conciliation, with a central board to which appeal could be made if necessary. During the week the scheme has been submitted to and has received the sanction of the executive committees of the unions concerned, the result being reported to the gathering on the 19th inst., over which Mr. W. T. Wilson, of Bolton, Chairman of the Amalgamated Society of Carpenters and Joiners, presided. The trades-unions have unanimously sanctioned the scheme, details of which have been sent to Mr. Hassal, of Liverpool, secretary of the National Association of Master Builders. It is understood that the offer of the Yorkshire masters put forward at their meeting last week to meet the men in conference was scarcely touched upon, the desire of the men being that they should deal with the masters as a whole, and not sectionally. At the same time the feeling was expressed that the withdrawal of the Yorkshire lock-out should be made a condition of the conference.

## THE READING AND DISTRICT BUILDING TRADE.

THE first annual dinner of the Reading and District Building Trades Association was held recently at the Great Western Hotel. Mr. Thomas F. Rider (past President of the National Association of Master Builders) presided.

The loyal toasts having been honoured, Mr. W. E. Collier gave the toast of the "Town and Trade of Reading," to which Mr. W. Galt Millar responded.

The Chairman, in proposing "The Association," remarked that at the present time almost every trade had its association. So far as the building trade was concerned, there were three ample and sufficient reasons for an association. The first was that they might meet together and by that means get to know each other better, that they might interchange feelings of amity, and interchange information, and generally derive from each others company much solid good. That they might also by that combination be able to fight where they were called upon to do what was unfair or unreasonable, and as an association they could do that better than as single individuals. In these days of combination amongst workmen—combination which, so long as it was properly conducted and confined to legitimate ends, they ought to be the last to object to—it seemed to him that what was sauce for the goose must be sauce for the gander. At the present time trades-unionism was stronger than it had ever been before. But what was the serious and sad side to the question was that the aggressive policy of the unions was increasing to an enormous extent. There was no need for him to give examples; they all knew of cases which came within their own experience, and it was a most inherent necessity that the builders should in every district throughout the land combine together, not for any oppression on the men, but to stand up for those rights which belonged to masters as well as to men, and insist that as a man received a fair day's wage, so the master should expect and should have a fair day's work; in a word, that they as well as the men should have what was fairly due and belonging to them. The hope of the National Association was that in every town and village there should be a masters' association; that those associations should be divided into four great centres, that those centres should be united to the National Association, and that when serious trouble arose in one part of the country, if that part of the country could not successfully deal with it, it should be taken up by the Federation for that part of the country in which the town or village was situated, and, finally, should the Federation be unable to effect a settlement, by the whole National Association of the country. The little trouble they had had with the plasterers was now smoothed over, and the terms of settlement were such as the master builders could justly pride themselves on.

Mr. Catley, the President of the Association, briefly referred to previous efforts which had been made to establish a Builders' Association in Reading. It was not revived in any way until during the bricklayers' strike. That was followed by the carpenters' strike, which still further welded them together, and then the old association was revived, or, rather, it had a new birth. He hoped and believed that the Association was going to be educational in its best sense. The Association found great difficulty in dealing with the great labour questions, and a Conciliation Board had been formed from which some of them hoped great things. He was happy to say that it had been taken up by the trades-unions in a very proper and just way. They had already dealt with the question of wages, and they had avoided that barbarous method of settling disputes—a strike. They were looking to the Board to help them over any difficulties which might occur in the future. He declared most emphatically that as an association they were not opposed to trades-unionism; they welcomed trades-unionism, they copied its best essentials, they welcomed the co-operation of the trades-unions, and they wished labour to have its rights, but co-equal with that they wished labour to perform its duties, and to allow them to perform their duties unrestricted. One of the most pressing problems, and one in which he hoped they would have the co-operation of the trades-unions, was how to get efficient workmen. The trades-unions said: "You shall give us a certain standard of wages." They had a right to say to the trades-unions: "You shall give us a certain standard of value." The conditions had altered since the time when an employer could judge what his workman was worth. They had now an equal rate of pay, and, therefore, they had a right to demand equal value in quantity and in quality. He believed he was expressing the feelings of every builder when he said that they did not find among the young men of the day that quality which they had a right to expect for the wages which they demanded. That was recognised by trades-unions themselves, who said they were almost powerless to remedy it. Whether a change was to be brought about by a revival of the old system of apprenticeship, or in whatever way it was thought best, it was a problem which had to be faced. It might be that young men wished to enjoy the full wages earlier, and were not willing to stay the necessary time to master their trade; but the facts were patent to all, and this was one of the things in which that Association, in combination with the trades-unions, might do exceedingly good work.

Mr. Bottrill proposed "The Architects and Surveyors," and emphasised the fact that the Association was not formed in hostility to the architects or any other profession or class. He touched upon the large amount of power placed in the hands of architects, and said it spoke volumes for the profession as a whole that such a custom should have obtained a footing without its becoming intolerably irksome. Mr. Bottrill deprecated the practice which prevailed among certain architects—generally young architects—of employing their own workmen, and remarked that such a practice would cure itself in no very long time.

Mr. Ravenscroft, in reply, referred to the change which had come over the relations between builders and architects from the time when they stood face to face, practically as antagonists. The architects were coming to feel that in the main they had to deal with men who cared for the honour of their trade—men whose intention was to do the right thing as between man and man. Personally, he had hoped that such associations as that would have been absolutely unnecessary. He would like to have seen the continuance of the old system, when the master and his men in their workshops stood shoulder to shoulder as against all comers, when the honour of the master was the honour of the men, and when the well-being of the men was the care of the master. Unfortunately, those days were past; that being so he was more than pleased to hear the remarks which fell from Mr. Catley. Let these unions be defensive, if they liked, not defiant, and certainly not offensive, and then, out of what to some of them had seemed an evil, might ultimately come to a great deal of good. With respect to two of the most important articles of the Association, which affected them as architects, viz., with reference to the arbitration clause and the question of quantities, Mr. Ravenscroft expressed his personal approval of what the Association had done, remarking, with respect to the first, that he failed to see why any architect should object to an arbitration clause. He wished the Association every prosperity, on the lines which their President had laid down

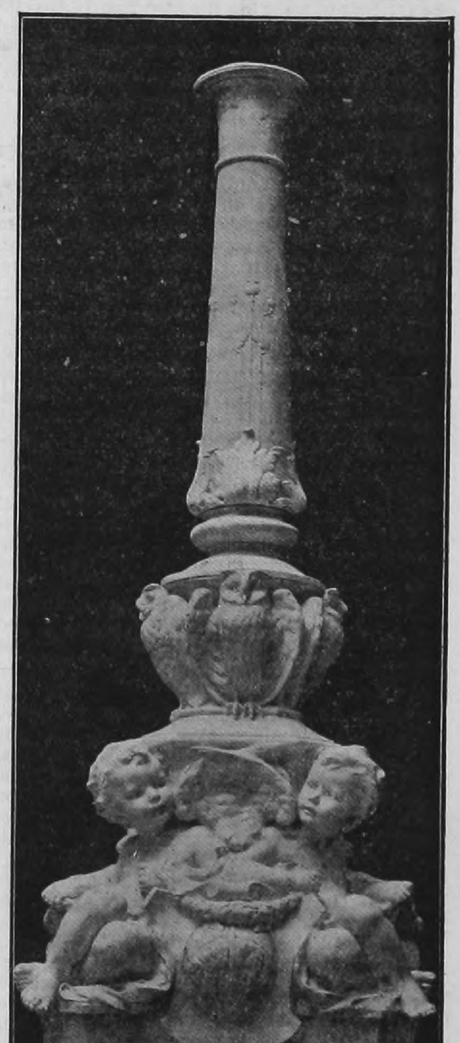
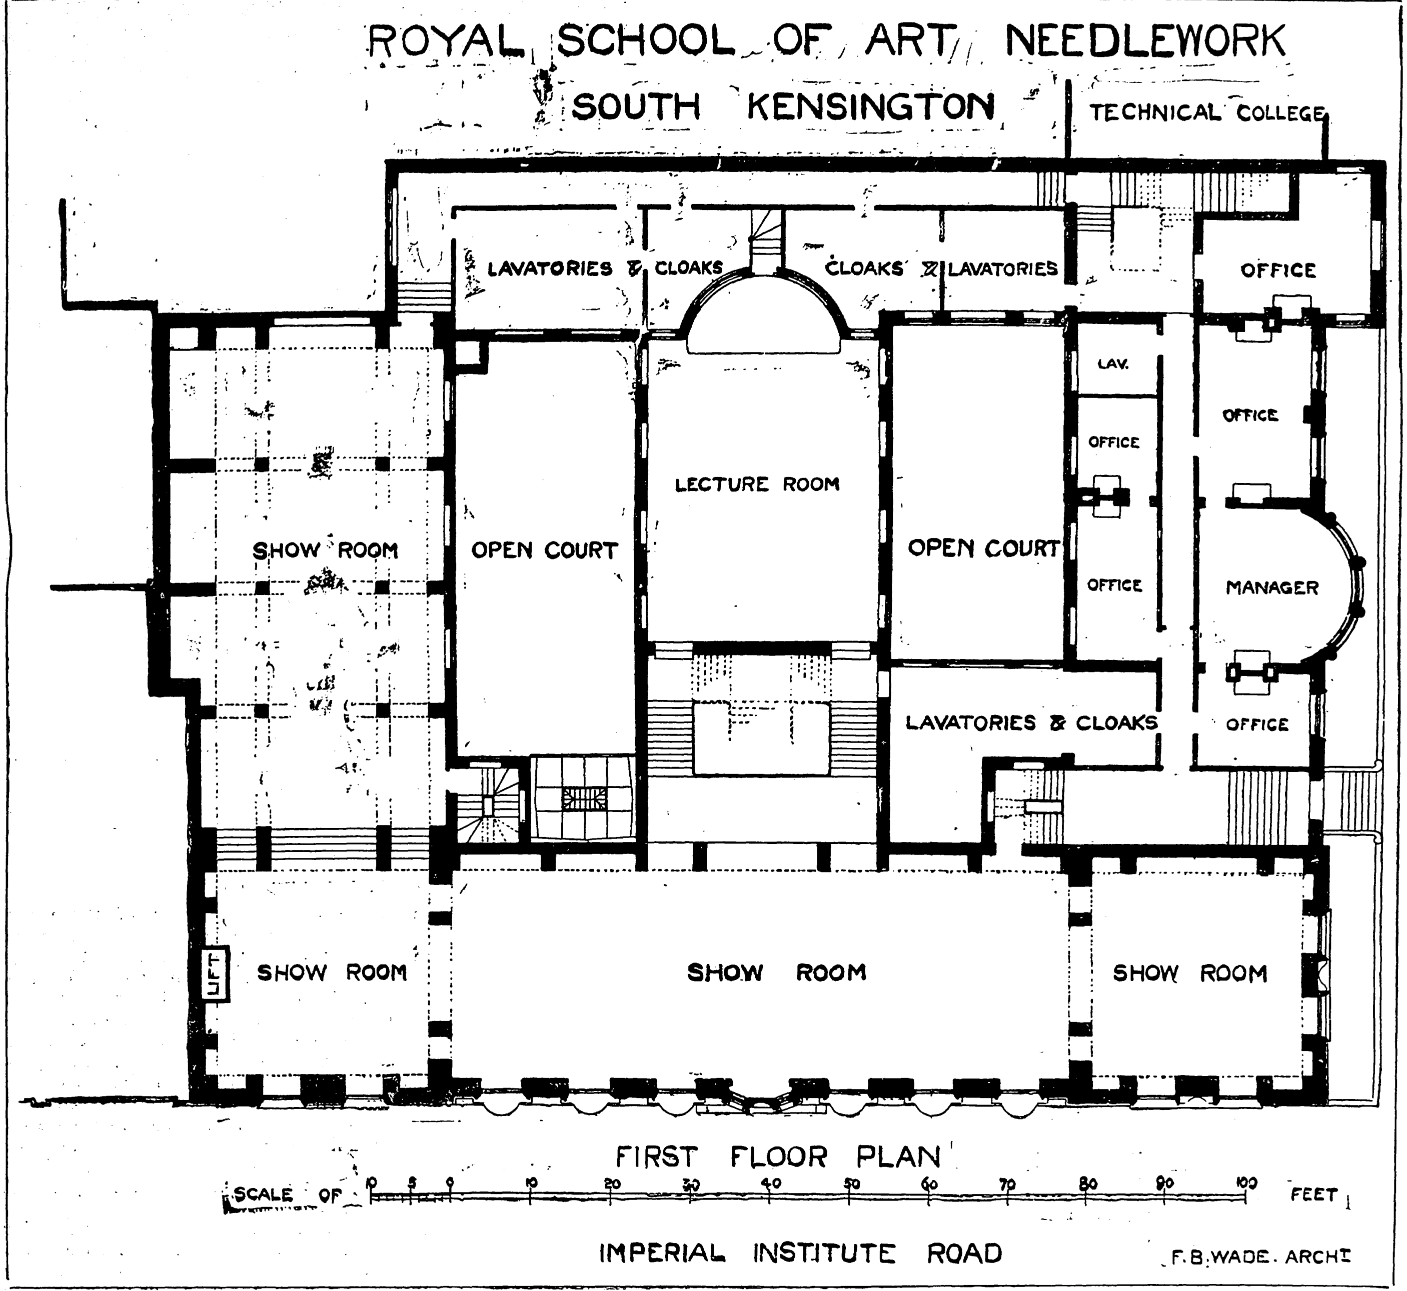
## BASE FOR ELECTRIC LAMP STANDARDS, LEEDS.

THIS piece of bronze sculpture, modelled by Mr. Alfred Drury, forms the base for six large electric lamp standards which are to be set up in the City Square at Leeds, and is exhibited this year among the sculpture in the octagon room at the Royal Academy. The proportions and design of the whole standard are shown in the accompanying illustration on a smaller scale.

We give prominence to the design for the base, not only for its intrinsic quality, but because it marks what we may hope is a new departure in this country, in the employment of high-class sculptural design for a lamp base, instead of the ordinary decorative castings, designed by no one in particular, which we are accustomed to see. The lamp stands 7 ft. high to the top of the cap; the base is 12 ft.



*Electric Lamp Standard for City Square, Leeds. Designed by Mr. Alfred Drury.*



ROYAL SCHOOL OF ART NEEDLEWORK
SOUTH KENSINGTON

FIRST FLOOR PLAN

4 in. wide; the figures of the children are life size. The owls, and the golden fleece on the cartouche, are taken from the city arms of Leeds.

The lamps, which will carry arc lights, are the special gift of the Lord Mayor, Col. Walter Harding.

## THE ROYAL SCHOOL OF ART NEEDLEWORK.

THE Royal School of Art Needlework has for some twenty-five years past occupied temporary premises in the Exhibition-road, next the Technical College. The new building, the foundation-stone of which was laid on Friday, the 23rd inst., by the Prince of Wales, is intended not only for the permanent housing of the R.S.A.N., but the school is making arrangements to establish classes for teaching and practising other forms of applied arts.

The building consists of large show-rooms, work-rooms, studios, and a quantity of moderate-sized class-rooms and the necessary offices for management.

Externally the materials are Portland stone and blue pennant for the lower story, 2-in. Bracknell bricks for the walling of the principal story, and Portland stone for the upper part.

Messrs. G. H. & A. Bywaters and Sons are the contractors, and Mr. Fairfax B. Wade is the architect.

## SCULPTURE AT THE ROYAL ACADEMY.

THE works represented in these two plates are introduced as illustrations to the article on "Sculpture at the Royal Academy" on another page of this issue, and are all referred to in that article.

# Correspondence.

*To the Editor of* THE BUILDER.

## EARLY REMAINS FOUND AT THE TOWER.

SIR,—Adverting to the "Note" in your paper of the 10th inst. (pages 564-5 *ante*), I venture to suggest that the iron and stone shot recently dug up in the Tower are relics of a manufacture formerly carried on there. Mr. E. Wyndham Hulme, Librarian of the Patent Office, kindly gives me the following references.

Office of Gunstone-maker of iron: the precise period of the creation of that office is not known; a grant of 1 Elizabeth to Ralph Hogge as iron gunstone-maker within the Tower of London, at 6d. *per diem*, recites that the grant was formerly held by [Sir] William Levet, lately deceased; a warrant of August 5, 1540, authorises payment of 80*l.* to Sir William Levet for 15 tons of shot of iron; the grant to Hogge was re-issued, 30 Elizabeth, to Thomas Johnson, and again, 38 Elizabeth, to Thomas Browne, to whom succeeded, 13 James I., his son John—the latter three being well-known gunfounders, having foundries in Kent.

Office of Gunstone-maker of stone: on August 18, 43 Elizabeth, the office of making stone shot for the ordnance is granted to Andrew Kirwin, *vice* Robert Gooer, deceased, at 8d. *per diem*, a re-issue of the patent in 11 James I., describes the office as being within the Tower of London.

W. E. D.—M.

## WANDSWORTH BOARD-ROOM COMPETITION.

SIR,—As a competitor, I can sympathise with your correspondents, Messrs. Clark & Hutchinson. The competition was, in my opinion, most incompetently managed.

The plan of site was not correct, the figures differing from the scale. Upon pointing these errors out to the secretary, I was treated with scant courtesy, and told to go and measure them for myself, as I was responsible for the measurements.

One clause in the particulars stated that the board-room was to be lighted from the roof, and a notice was subsequently sent round to say the clause was intended to apply to the gas or electric light. The clause as to the staircases was so ambiguous that no one could say whether they required two or three. As to the judging, something must be radically wrong. The cubic contents, giving all accommodation asked for, amounted to 305,041 cubic ft., at 1s. per ft. = 15,500*l.* The successful candidate prices the building at 11d., and makes it 18,000*l.*, thus giving 41,712 cubic ft. accommodation, which was not required; and, probably, if all the competitors had worked on the same basis, the result would have been different.

HUGH T. PORTER, A.R.I.B.A.

## THE MAISON DIEU, DOVER.

SIR,—In reference to your Note in the *Builder* of June 17 respecting the Maison Dieu, the forthcoming sale of the Maison Dieu property does *not* include the building known as the "Maison Dieu," as that is the present Dover Town Hall. The interesting Elizabethan mansion which is for sale is known as "Maison Dieu House."

JOHN BAVINGTON JONES.

⁂ We were misled by the terms of the advertisement, which cites, "The estate known as Maison Dieu. . . . adjoining the Town Hall." Knowing that the old Maison Dieu was until lately the Town Hall, we purposely mentioned the new Town Hall (by Burges), opened in 1883. It appears from our correspondent's letter that the present Dover Town Hall is now known as the "Maison Dieu"—a source of confusion.—ED.

◆

PROPOSED CHURCH AND HALL, TAYPORT, N.B.—It is proposed to erect a new Episcopal church and hall at Tayport. The church will be seated for 200 and the hall for 130. Mr. T. Martin Cappon is the architect.

# The Student's Column.

## ARCHITECTURAL HYGIENE.

### XXIV.—REPORTS

WE give here an imaginary Report, as an example that may be useful. Of course every case will have its own peculiarities, which must be carefully studied, but perhaps the following may serve as a useful guide, and may act as a reminder of points that might otherwise perhaps be overlooked.

The Report is supposed to refer to a country house which is to be altered and improved :—

SIR,—In accordance with your instructions of the        and your letter of the        we have surveyed the above property with the object of advising you as to its general condition from a structural and sanitary point of view.

### 1. THE HOUSE.

The house is situated in the parish of ——, and is on the high road between Hickley and Bexbroom, in the county of Downshire. It is therefore comparatively easy of access by road, but it is some three miles from the nearest railway station, which being on the London and Wreckham Railway has a very poor service of trains. It is some 600 ft. above the sea level, and is built upon a sandy soil, and is considered to be very healthy, and well adapted for the purpose you require. The death-rate for the locality is returned as averaging only 18 per 1,000. The rainfall is estimated at 32 in. per annum.

With regard to the general plan and convenience of the house and its structural condition there are several points upon which we should like to draw your attention. We will take these seriatim, making the drains and sanitary work the subject of a separate report. We enclose a plan of the house as at present with suggested alterations marked thereon (fig. 300).

The house appears to have been built about the end of the seventeenth century, and to have been very little altered since that time. It contains a fairly large hall, drawing-room, library, dining-room, morning-room, water-closet under stairs and entered directly from hall, butler's pantry, kitchen, scullery, and the usual offices.

The library is at present a thoroughfare room leading to the drawing-room ; this is, of course, very inconvenient. We would suggest that a wall be placed across the northern end of the room, and a passage thus formed which will give privacy to the library. This room is also quite insufficiently lighted for its purpose. We would suggest that the present window be made into a doorway, and that a window 2 ft. wide be opened out on either side, which will greatly improve the room. The living rooms are all rightly placed on the south side of the house, but the sun's glare would perhaps be rather much for the library, and we would therefore suggest, in order to make the drawing and dining-rooms more convenient, that bay windows be placed as shown, and that the roof should be continued between the two so as to form a covered verandah. The entrance is on the north, and in order to protect the house from the cold north winds which blow across the rather damp meadow land in this direction, we would suggest that a second set of glazed doors be placed as shown, and that a *porte-cochère* be added. The hall is also somewhat gloomy, and windows should be inserted on either side of the entrance door.

At present the service to the dining-room is along the staircase and across the front hall ; this is, of course, very objectionable. We would suggest that a service hatch be placed as indicated, so that the front hall need not be entered. This is, of course, not an ideal arrangement, but it will, we think, answer satisfactorily.

Taking next the inner hall, the water-closet, as mentioned previously, is entered directly from this hall. We would suggest that this be removed entirely, and that a sanitary wing be built out as shown, with proper cross ventilation, the ventilating lobby being used as cloak-room, which is much required.

The kitchen is somewhat badly lighted. We should suggest that a small side window be inserted so that light may be thrown on the kitchen range from the left side, thus enabling the cook to see what she is about. The servants' water-closet is too close to the larder to be at all healthy or pleasant. It would be better to pull this down and thus give better light and ventilation to the larder by the insertion of a new window. The servants' water-closet should be re-erected in the backyard, as shown, and access should be provided by a covered way. Off this covered way should be placed a boot-room, a knife-room, and a small coal-store.

We consider that a billiard-room should be added to a house of this character, and we have shown where this could be conveniently built.

*Upper Floor.*—There are no servants' stairs to this floor, which and we suggest that this is absolutely necessary in a house of this character. These can start from below where the old water-closet and lobby now are, and land on the upper floor in a passage to the north of the scullery, giving access to the two servants' bedrooms over the kitchen and scullery. There is no bath-room, water-closet, or housemaids' closet on this floor. These can all be placed in the new sanitary wing. The westernmost bedroom has no window on the south front, and as this would cost very little, we would suggest that one be provided there.

### 2. WALLS.

The walls are of stone, which have weathered very well, and we do not suggest that anything should be done except that some necessary pointing must be executed near the top of the walls.

The most serious thing which we discovered is that there is apparently no damp-course, and that in consequence the damp has risen, especially in the north-east corner near the well. Of course a damp-course should be put. We do not think that this need be a very expensive matter. We should advise that a perforated stoneware damp-course be inserted all round the house 6 in. above the ground level, and that this should be done in small pieces at a time (say in 2-ft. lengths) so as not to endanger the fabric. In many cases we noticed that the level of the ground had in course of years risen above the level of the floor joists. We would therefore suggest that this be carefully removed so as to be 6 in. below the level of the damp-course, the latter being inserted under the ground floor timbers.

As to the walling generally, this is sound, with the exception of an old crack in the lintel above one of the ground-floor windows, but on examination this does not appear to have extended for some considerable time. We should therefore merely point this up in cement.

### 3. FLOORS.

The floors, as is to be expected in such an old house, are in many places very dilapidated. The timbers to the ground floor have been attacked by dry rot through want of sufficient ventilation. In the library this is specially noticeable, as in one place the flooring has completely collapsed. New joists and boarding will have to be fixed here. The joints between the boarding in the other rooms are very wide, and when the underside is ventilated will cause the rooms to be very draughty, besides harbouring dust. We would, therefore, suggest that $\frac{1}{4}$-in. parquet be laid round the edges of all the sitting-rooms and over the entire hall, and that the central part of each room, over which the carpet will come, should have the joints caulked with beeswax, the cleaning in future to be done with beeswax and turpentine, this being much preferable to washing. The upper floors are comparatively sound, but the edges (for about 2 ft.) of all rooms on the first floor should be stained and varnished, so that central carpets may be laid down.

### 4. CEILINGS.

The ceilings will require whitewashing throughout. Those to the drawing-room and dining-room are of an ornamental description of the Adam's type and will require making good in parts and picking out in party colours.

### 5. WINDOWS.

These are principally casements of iron and filled with leaded lights in small squares. They obstruct the view to a certain extent, but would very much detract from the character of the house if they were removed. We would, however, suggest that one of the lower lights in each room might be replaced with plate glass.

The pointing to the frames will require making good in cement, several of the fastenings will require repair.

### 6. ROOFS.

We thoroughly explored these with the caretaker, and find the original tiling will in many require stripping off and new tiles to be laid. In other cases the oak pins, which were used in fixing them to the laths, have rotted, although the tiles are quite good. Roughly speaking, about one-quarter of the roof will have to be relaid. The flashings and gutters will have to be relaid, though everywhere the lead is comparatively good. The various settlements which have taken place have seriously affected the fall of the gutters. Cement filleting has been employed where the roof meets the gables. This is defective, and should be stripped off, and "lead soakers" used instead.

The chimneystacks are very exposed, and have been partly blown down. They will require carefully reinstating, with new chimney-pots and flaunching in cement and pointing. The woodwork to the trap-door to roof has rotted away, and does not keep out the rain. It will require a new door and lining.

### 7. DECORATION.

Beyond the whitening to the ceilings already mentioned, the house will want papering throughout, the present paper being entirely stripped and the walls made good. The ground-floor rooms are mostly panelled, but have been painted white. We find that this is all oak-panelling, and it will be well to consider whether you would prefer the paint being carefully removed so as to leave the original oak visible. All the rest of the woodwork throughout the house will require rubbing down, preparing and painting two coats of good oil colour.

The ironwork, internal and external, will also require painting.

The mantelpieces are of good design with marble borders, and will merely require painting, pickling, and cleaning.

### 8. HEATING AND VENTILATION.

As to the fire-places, many of these are of old and obsolete pattern, with very little heating capacity. We should advise that these be taken, and new ones of improved Pridgin Teale or other approved pattern be inserted. Some form of heating apparatus will certainly be required, as the house is in a very exposed position. The passages especially should have radiators of the ventilating type fixed on a low-pressure flow and return apparatus. We should advise on the ground floor—two in the outer hall, one in the passage leading to drawing-room, and one in the inner hall ; and, on the first floor, at least four will be required.

There is room for a small boiler-house under the kitchen, which has been used as a beer-cellar, a window with open area could be put to this, and a new flue made, or the hot-water supply system might be continued to be worked from the kitchen fireplace, but a new kitchener will be required in place of the antiquated one now in use, so that the opportunity of improving the supply can be taken in hand at the same time.

The ventilation will be materially improved by the suggested alterations.

*Lighting.*—No gas or electric mains are at hand, so that oil and candles are the only illuminants available. The present fittings are of the poorest description, and new ones will be required throughout.

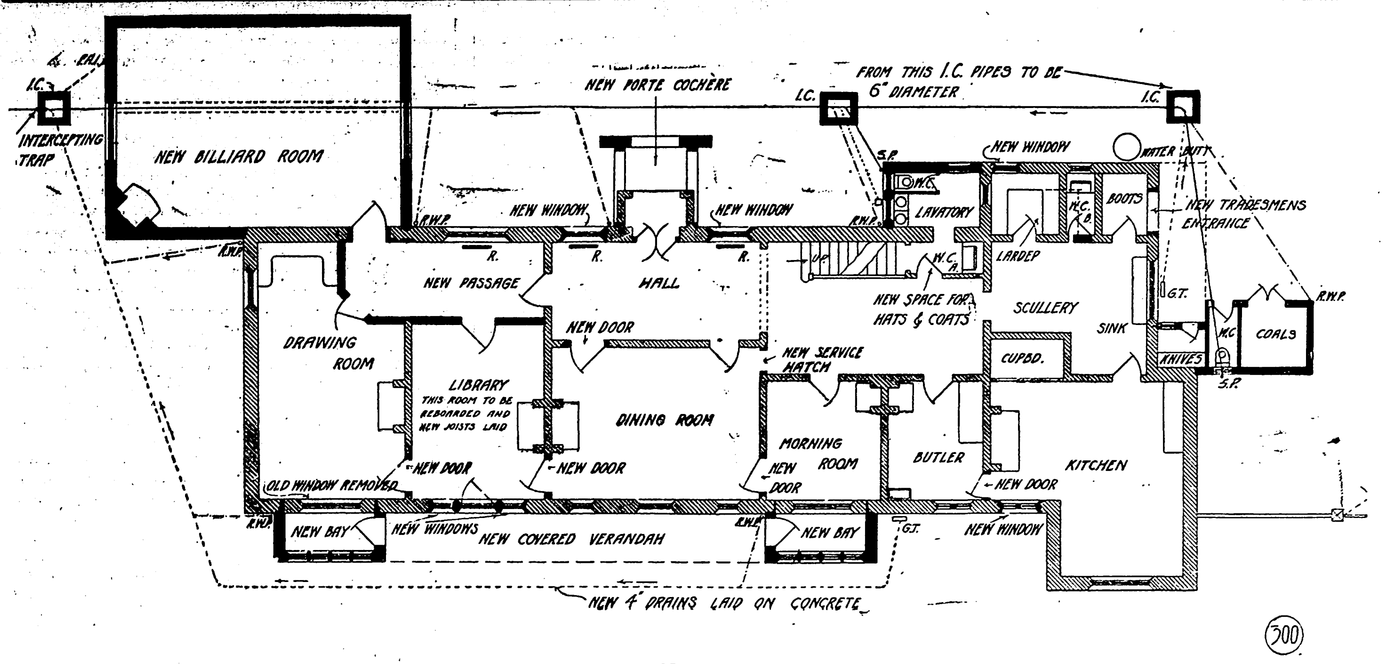
### 8. SANITARY WORK.

This may be conveniently detailed under the headings of

*a. Sanitary Fittings.*
*b. Drainage.*
*c. Water Supply.*

*a. Sanitary Fittings.*—These are throughout the house of the most obsolete kind, and should all be removed. This will be the more easy to do because the new sanitary wing, which we suggest should be built, will give the opportunity. For example, the present water-closet on ground-floor is of the old D-trap and container, and from use for so many years has become almost eaten through with the acids from sewage.

The servants' water-closet, which is to be removed to the yard, is of the obsolete "hopper" pattern. We would suggest that the ground-floor water-closet should be of the "wash-down" type of any suitable make, and should be provided with "lift-up" seat so as to be used as a urinal. No "casings" should be employed in the new fittings. The upstairs water-closet may also be of the "wash-down" type or of the "siphonic type." The *bath* on the first floor should stand on legs and have no



NOTES.

Water-closet marked *a* removed and space used for hats and coats.
Water-closet marked *b* removed for extension of larder.
Pipes under billiard-room to be embedded in concrete.
Drain pipes marked thus ——— indicate soil.

"S.P."—Soil pipe.

*Illustration to Student's Column.*

"casings," so that the floor, &c., can be easily cleaned. A *housemaid's sink* may be provided for the emptying of slops, but I would strongly advise that the water-closet pan be used for the purpose, as the multiplication of sanitary fittings is not a good thing. The supply to the water-closets must be by means of siphon flushing cisterns. The *soil-pipes* are defective in many parts, they are of lead, but are made of the old type with a seam in them, they are not taken up and ventilated as they should be.

New soil-pipes of *drawn lead* should be inserted and secured to the wall by three tacks in every 10 ft. and taken up 6 ft. above the highest window and covered with a wire cage.

The *scullery sink* is at present of stone and is soaked through and through with accumulated grease. There is an antiquated "bell" trap fixed in it. A new glazed stoneware sink should be provided with proper 2-in. anti D lead-trap with screw inspection eye. This waste should discharge over an open *slipper-pipe* 18 in. long with gully trap at end.

*b. Drainage.*—We had the drainage opened up in several parts and find that it is of the most primitive description. It consists of 6-in. pipes, unglazed, butted against each other. They have been laid merely in the ground, on no proper foundation, and the consequence is that, owing to settlements, there is no proper fall, and the sewage has for many years been soaking into the ground surrounding the house.

These old drains must all be taken up and proper 4-in. glazed stoneware socketted drain-pipes, jointed in neat cement, and laid on a 6-in. bed of Portland cement concrete, properly flaunched to top of pipe, laid in their stead.

New gulley traps must be placed at the foot of all rainwater pipes, bath wastes, &c., all set on a proper bed of concrete 6 in. thick.

The general setting out of the drains is sketched on the plans. The present cesspools must be emptied out and thoroughly disinfected and filled in with lime-concrete. The new drains will empty into the main sewer now in the road and there should be inspection chambers as sketched. A fresh air inlet should be provided at the lower end of the drainage system and the house drains would be disconnected from the main sewer by a disconnecting trap with inspection eye as sketched on the plan.

### 9. WATER SUPPLY.

The present water supply is quite unfit for domestic use. We brought away a quart bottle and tested as to colour, taste, smell, with distilled water, and it does not pass the test in any of these particulars.

This is partly accounted for by the fact that the water supply is pumped from a well near the scullery. This well is of the "shallow" kind. Although we cannot find that any of the sewage has actually penetrated into it, yet, as the soil round the house is thoroughly impregnated with fæcal matter, we expect that it may have contaminated it. We suggest, therefore, that the well may be kept for irrigation purposes, but that the house supply should be taken from the new water main in the public road. This will not be a costly matter. The old lead cistern in the roof should be taken away, and a new galvanised iron cistern for 1,000 gallons be fixed in its place, fitted with proper ball-cock and overflow pipe. The cistern-room should be perfectly light and well ventilated, so that all dirt can be seen to be removed, and we would suggest that a small dormer window be inserted in the roof to effect this purpose. As to drinking-water we would suggest that this be taken direct from the main by a tap at the scullery sink. If desired a "Berkfield" filter can be fixed to the tap, and the drinking water supply thus rendered safe.

### 10. DISPOSAL OF REFUSE.

All the vegetable matter and garbage should be burnt in the fire-box of the new kitchen range. There is no collection by the Local Authority so that this devolves upon the occupier.

### 11. APPROXIMATE ESTIMATES.

We understand the lessor is willing to expend 500*l.* on repairs, renovations, and improvements. This we do not consider to be sufficient. Our estimate is as follows :—

| | |
|---|---|
| Repairs to walls, floors, roofs, including papering and painting throughout (including erection of new billiard room), we estimate as follows :— | £650 0 0 |
| The erection of the new sanitary wing and the whole of the work comprised in our report of the sanitary condition of house ... | £350 0 0 |
| | £1,000 0 0 |

We think the lessor should be asked to expend 600*l.* in order to put the house into an habitable and sanitary condition.

We understand that you, as the lessee, are willing to expend 400*l.* on the alterations and additions, &c., affecting your convenience. We think that this sum may cover cost of the building of the billiard-room, the *porte cochère*, the insertion of bay windows in drawing-room or dining-room, the formation of passage behind library, and the new stoves and chimney-pieces mentioned in my report. It should also include the necessary heating apparatus. If the lessor agrees to expend the sum as above we think you would be justified in taking the house on a twenty-one years' lease with the usual covenants. Provided the lessor agrees to do this, an architect should be appointed by you to guard your interests in the matter, and the whole of the work should be done to his satisfaction.

## *GENERAL BUILDING NEWS.*

PARISH CHURCH, CRAIGLOCKHART, EDINBURGH.—The Parish Church at Craiglockhart has just been dedicated after alteration. The roof has been reconstructed, the walls decorated, and a stone tower and spire has been erected at the south-west corner adjoining the porch, with which the tower is connected by a staircase. The first stage of the tower rises 45 ft. from the ground, and is 17 ft. square—carried up without buttresses—above this, and recessed back a little, is the belfry, a height of 62 ft. from ground to parapet. The corners of the tower are continued above this with buttresses resting on carved gargoyles at the parapet, and finished in crocketted pinnacles. Above this rises the spire to a height of 98 ft. from the ground. The pinnacles are connected to the spire with flying buttresses, each finished with the carved figure of a griffin. The upper stage of the tower has a two-light tracery window on each face, and the belfry has a three-light window on each face. The grounds have also been enclosed with stone walls and iron railings. The work was carried through by Messrs. Hay & Henderson, architects, from whose design the church was built in 1889-90.

PRESBYTERIAN CHURCH, TOOTING.—A new Presbyterian Church has just been opened at Tooting. The church has been built of red brick with stone dressings, from plans prepared by Mr. Thos. Arnold. It is capable of seating 750. The pulpit is in one corner in front of an organ built by Messrs. Mybrea & Cartwright, of Holloway. The seating of the church has been carried out by the Bennet Furnishing Company, whilst the system of heating adopted is hot water low pressure with Gurney's heater and radiators, and the work has been carried out by the Anglo-Canadian Heating and Ventilating Company. The whole of the work has been carried out under the superintendence of Mr. J. Stevenson, clerk of works, the builders being Messrs. Johnson & Co., Limited.

CONGREGATIONAL CHURCH, LEEDS.—A Congregational Church is about to be erected in Harehills-road, Leeds, from designs prepared by Mr. T.

Dyer. The church is planned to seat 750 persons. It will have nave and transepts, and a gallery at the end over the main entrance. Vestries for the pastor and choir, and ladies' and gentlemen's cloak-rooms, will be provided. The building will be of brick, with stone dressings, and the tower will rise to a height of about 100 ft.

Congregational Church, Morpeth. — The new church and premises for Sunday school and social purposes, built by the Congregationalists of Morpeth, were opened recently. The new church and schools occupy a position in Dacre-street, Morpeth. The buildings are Early English in style, and the plans, which were prepared by Mr. J. Walton Taylor, of Newcastle-on-Tyne, are for a church to seat 350 persons, lecture hall to accommodate 250, large infants' class-room, fitted up with tea boiler, &c. The cost of the whole, including land, was about 2,700*l*.

Church, St. Barnabas, Birmingham.—On the 14th inst. Lady Holder laid the foundation stone of the new Church of St. Barnabas, at Ladypool-road. When completed the church will take the place of a small iron building which has accommodation for only about 600 persons. The plans, prepared by Mr. T. Frederick Proud, the architect, provide at present only for the erection of a chancel, with organ chamber and vestries, but when complete the church will consist of a wide nave, aisles, transepts, and morning chapel. The chancel will be 24 ft. wide, with apsidal end, the morning chapel and organ chamber being separated by richly-moulded arches. At the corner of Ladypool and Clifton roads a tower will be erected, under which is the main entrance. A projecting octagonal baptistry adjoins, and above rises the end of the nave with a group of traceried windows. The south side shows a range of traceried clearstory windows and buttresses. The building will be constructed of red brick, with moulded terra-cotta arches and tracery, and covered by an open timber roof and green slates. The church will hold 900 people, and the cost, exclusive of the tower, will be 6,000*l*. The builders are Messrs. E. Giles & Son, of Camp Hill.

Free Church, Carnock, Fife.—The new Free Church at Carnock has just been opened. The church was built from plans prepared by Mr. A. Scobie, architect, Dunfermline. It is a Gothic structure, with accommodation for 300 worshippers, and there is a small hall at the back for Sunday school and other meetings, besides a vestry and closet accommodation. The contractors for the work were :—Mason, Wm. Templeman, Cairneyhill; joiner, David Graham; slaters and plasterers, M'Gregor & M'Owan; plumbers, Muir & Gillan; glazier, Alex. Lowe; painter, Henry Hoggan; heating engineers, D. Lorne & Sons, Edinburgh; iron work, gates, and railings, Charles Wilson, Carnock.

Church, Colton, Yorkshire.—A small church, to be known as St. Paul's, has just been consecrated at Colton, a hamlet situated about four miles from Tadcaster. The edifice is of brick. The roof is panelled internally, and on the outside is covered with red tiles, with a bell cot. The nave is seated with stained deal open benches. The plans were prepared by Mr. C. Hodgson Fowler, F.S.A., of Durham; Mr. A. Barnes, of Malton, was the general contractor; Mr. John Nicholson, of Barton-le-Willows, provided the seating accommodation; and Mr. T. Bolton was the clerk of works. The structure provides sitting accommodation for eighty persons

Free Church, Elderslie, Glasgow.—The memorial stone has just been laid of the Free Church which is being erected in Elderslie at the corner of Glenpatrick-road and the lane leading to Eldersley Public Hall. The building, designed by Mr. W. D. M'Lennan, Paisley, will seat 430 worshippers.

Primitive Methodist Chapel, Northampton.—The Kettering-road Primitive Methodist Chapel was reopened on the 11th inst. after renovation and improvement. The interior of the building has been redecorated, the electric light has been installed, and certain alterations have been made to the vestibule and the lobbies leading to the galleries, together with other minor structural improvements. The painting work has been carried out by Mr. H. M. Goy; the installation of the electric light was by Mr. A. C. Dickens; and the carpentering work has been carried out by Messrs. Wilson and Alright. The whole has been executed under the superintendence of Mr. H. H. Dyer, architect, Northampton.

National Schools, Normanton. — The Archbishop of York recently opened new Church schools at Normanton. The establishment is for both boys and girls, and is so adapted as to provide two large open apartments, or be shut off into seven classrooms. It is built of brick with stone dressings, and the total cost is about 3,100*l*. The contract has been carried out by Messrs. R. L. Leak & Sons, of Normanton, from the designs of Mr. Arthur Hartley, architect, of Castleford.

Hotel, Caister-on-Sea.—The Manor House Hotel at this retired watering-place having proved inadequate to accommodate the number of would-be visitors, is about to be enlarged, and Messrs. George J. & F. W. Skipper, architects, of Norwich, are now preparing plans with a view to the work being carried out immediately after the season is over. With the new rooms the hotel, whilst losing none of its quietude, will become much more commodius and comfortable; a large lounge or central hall will be a special feature, and all the new bedrooms will be of ample size and with sea views. Just beyond the hotel new houses are being erected, and a new building estate is being laid out by the owners of the hotel.

House, Edgbaston, Birmingham.—A visit of the Birmingham Architectural Association was recently made to the new house of Mr. Percy Jones, Woodbourne-road, Edgbaston, recently erected from the designs of Messrs. Bateman & Bateman.

Hotel, Beeston, Notts. — The new Victoria Hotel in course of erection upon the site of the old house of the same name adjoining the station premises will occupy less in area than its predecessor by close upon 200 square yards, which amount of land the owners have transferred to the Beeston Urban Authority for the purposes of widening Ryland-road at that point to 29 ft. The elevation will be faced with pressed bricks and stone dressings. Mr. Enoch Hind is the contractor, and Mr. W. H. Tarrand, of York, the architect.

Convent, Ballymacarrett, Belfast.—On the 13th inst., the foundation-stone of a new convent and home in Ballymacarrett was laid. Messrs. John Courtney & Co. are the builders, and Messrs. E. & J. Byrne the architects. The total cost will be nearly 5,000*l*.

Shooting Lodge, Glenfarquhar Estate, N.B.—A new shooting lodge is in course of erection on the estate of Glenfarquhar, on the west side of Hershaw Hill, near the site of the old castle of Glenfarquhar, which is now demolished. The floor space is 87 ft. in length by 60 ft. in width, and in addition to the usual number of public rooms, a large number of bedrooms, and servants' accommodation will be provided. The lower portion of the lodge is built of stones from a local quarry and dressed stones from Aberdeen; while the upper portion is of half timber work, filled with concrete, "harled" with lime. The roof will be covered with red tiles from the Coalbrookdale Company's works. The lodge has been designed by Mr. George Bennett Mitchell, architect, and the following are the contractors :—Mason work: Mr. George Hall, Aberdeen; carpenters: Messrs. A. & J. Tindal, Fordoun; roof-tiling, Messrs. J. Lindsay & Son, Montrose; floor tiles and grates, Messrs. J. Bannochie, Aberdeen; plaster work, Messrs J. & C. Thomson, Brechin; plumber and water supply, Messrs. C. Wood & Co., Montrose; painting, Messrs. J. Mason & Sons, Queen-street, Aberdeen.

Hospital, Govan, N.B. — The new hospital which has been acquired by the Govan Parish Council at Merryflats, Govan, was opened on the 15th inst. This hospital extension has been carried out within the Merryflats grounds to the westward of the old hospital, and connected with it by a continuation in a direct line of the central corridor, which is the east and west axis of the buildings. A connecting wing lying along line of corridor has a single ward of sixteen beds on the ground floor. The upper floor of this block is divided into twelve bedrooms for nurses. The main block of double wards is placed north and south, with a frontage of 145 ft., and two stories in height, each of 13 ft. ceilings. In the centre are placed two convalescents' day rooms, with porches opening upon airing grounds. On the first floor there has been provided maternity rooms, including bath-room and nurses' room. In the main block are four double-breadth wards, 95 ft. by 24 ft., each for twenty-eight beds. The closets and bath-rooms are placed in angle pavilions, having ventilated cut-off lobbies. The buildings have been heated and ventilated on the plenum system. To enable the same modern system of heating and ventilation to be applied to the old hospital, subways have been excavated under the old buildings. The works have been planned by Messrs. H. & D. Barclay, architects, and carried out under their superintendence, they being assisted by the master of works, Mr. Peter M'Auslan. The contractors were :—Masons, Messrs. Horne & Stewart; wright, Mr. Robert Rogerson; plumbers, Messrs. John Paterson & Co.; slaters, Messrs. John M'Ouat & Son; plasterers, Messrs. William Halley & Co.; glaziers, Messrs. C. & J. Malloch; ironmongers, Messrs. Wm. M'Geoch & Co.; painter, Mr. George W. Sellars; steam boiler, Messrs. Wm. Wilson & Sons; engineer, Mr. John Cochrane; steam fittings, Mr. J. M'Callum.

New Goods Warehouse, Broad-street.—Messrs. Kirk & Randall, the well-known contractors of Woolwich, have just completed the erection of a large goods warehouse at Broad-street, City, for the London and North-Western Railway Company, from the designs of Mr. Francis Stevenson, Chief Engineer, Euston Station, assisted by Mr. E. B. Thornhill, with Mr. Keyte as resident engineer. The building covers an area of 50,000 square feet, and consists of four floors and two basements, and its cost was rather more than 100,000*l*. It is lighted throughout by electricity.

Business Premises, Belfast.—A new restaurant has recently been opened in Castle-place, Belfast. The building includes, besides the dining accommodation, private dining-rooms, ladies'-rooms, smoking, reading, and billiard-rooms, and a ball-room. The kitchen, bakery, &c., occupy the rear portion of the second floor, the front portion consisting of the smoking, reading, and three of the private dining-rooms. The ball-room is on the third floor. The building was erected by Messrs. M'Laughlin & Harvey, of Belfast, from the designs of Messrs. J. J. Phillips & Son, also of Belfast.

Building in Leeds.—The report of the Plans Committee of Leeds Corporation, shows that during the year ended March 25 last no less than 2,800 plans for new buildings or for extensions or alterations passed through the hands of the Committee. During the preceding year the number of plans submitted for approval was 2,400. At the last meeting plans for the erection of no less than 237 buildings were submitted. Mr. Towers, the chief building inspector, states that the dispute in the building trade has not yet appeared to have had the slighest effect on the number of plans, which go on increasing almost week by week. In every suburb of Leeds scores of buildings are in course of—or, as a result of the lock-out, awaiting—erection. In the neighbourhood of Harehills-road, Harehills-lane, and Burmantofts hundreds of new houses have made their appearance during the last couple of years, whilst scores of others are now being erected or are in contemplation. In Holbeck, Hunslet, Headingley, Beeston Hill, and Bramley the builders have of late been equally active. Indeed, never have the builders of Leeds had such a prosperous period as during the past two years. What is, perhaps, an even more satisfactory feature of the report than the large increase in the number of dwellings erected is the large increase of late in the number of plans for extensions of works. Within the last few months plans have been approved for large extensions at Messrs. Taylor's forge, Clarence-road, Hunslet; Messrs. Fitton Bros., engineers, of Bramley; Messrs. Tannett & Walker, Hunslet; the Leeds Fireclay Company, Wortley; Messrs. Berry & Co., of the Croydon Engineering Works; and Messrs. Greenwood & Batley, of Armley, have also recently extended their works, or are about to do so. At Horsforth, Messrs. Whittaker Bros., the contractors, are likewise making large additions to their engineering department.—*Leeds Mercury.*

Reconstruction of Queen's Restaurant, Aberdeen.—This building—formerly the Hall and Library of the Aberdeen Society of Advocates—situated at the junction of Union-street and Back-wynd, has been converted into shops on the ground floor and high-class restaurant for the Cabin Tea Company, Glasgow, on the upper stories. The restaurant entrance is from Union-street by a marble stair, the staircase walls being also lined with marble. On the first floor the large hall—60 ft. long by 35 ft. wide—with domed ceiling, has been fitted up as a dining-room. The floor is of pitch pine polished for dancing. Screened off from this room by a movable mahogany screen is a tea-room, 42 ft. long by 22 ft. wide, and on occasion of a ball both rooms can be thrown into one. Above the tea-room are smoking-room and billiard-room, and entering off Back-wynd is a bar. A suite of billiard-room and two dining-rooms open off the bar, and opening off the tea-room to Union-street is a stone balcony. Stained glass has been introduced at various parts, and the total cost of reconstruction will exceed 6,000*l*. Mr. A. Marshall Mackenzie, A.R.S.A., Aberdeen, is architect.

Club Premises, Sheffield.—The old Athenæum in George-street, Sheffield, is now being pulled down to make way for the new premises, which will occupy a much larger site. The architects for the new club buildings are Messrs. Flockton, Gibbs, & Flockton, of Sheffield.

Infectious Hospital, Kingsthorpe, Northampton.—The new infectious diseases hospital for the Urban District of Kingsthorpe was opened recently. There are two wards. The one on the north-east side is 24 ft. by 26 ft., and in it there is accommodation for eight beds. The other, on the south-east side, is 24 ft. by 18 ft., and is built on the pavilion style, and will accommodate four patients. In both wards provisions have been made for the nurses, whose room is placed in the centre of the buildings. There are also bath-rooms. At the rear are the out-buildings, which comprise disinfecting apparatus, a laundry, a coach-house for the ambulance van, and a mortuary. In the front is the administrative cottage for the caretaker and the matron. There is a dispensing-room for the medical officer, and rooms for both night and day nurses. The buildings are of local brick, with tile roofing and Bath stone dressing. The plans were prepared by Mr. J. T. Ingman, the Surveyor to the Council, and the building has been carried out by Mr. G. J. Fisher, of Northampton, the contractor.

Proposed New Joint Hospital for the Isle of Thanet.—An enquiry was held at the Town Hall, Ramsgate, on the 7th inst. by Mr. R. Deane Sweeting, Local Government Board Inspector, relative to an application by the Isle of Thanet Joint Hospital Board for sanction to borrow a sum of 40,000*l*. for the purpose of erecting a new hospital. It was explained that the new hospital would be erected on a site situated on the Sandwich-road, just off the main road between Ramsgate and Margate. The plans have been prepared by Messrs. Langham & Osborn.

Public Baths, Plaistow.—The foundation stone has just been laid of public baths, Plaistow. The buildings will be erected on part of the Balaam-street site, with a frontage of 126 ft. to the road. The following accommodation is provided, viz :—First-class men's swimming bath, with water area of

100 ft. by 27 ft., and from 6 ft. 6 in. to 3 ft. 6 in. in depth. Second-class men's swimming bath with water area of 60 ft. by 20 ft., and from 6 ft. to 3 ft. in depth. Two club rooms, one to each bath. Five first-class men's warm baths; twelve second-class men's warm baths; five first-class women's warm baths; five second-class women's warm baths. Committee-room; ticket office; superintendent's office; superintendent's apartments with two sitting and three bedrooms, and a kitchen and bath-room, &c.; towel laundry and towel store; boiler house; engine-room; coal stores; waiting-room to each department; entrance hall. The architect is Mr. A. Saxon Snell. The building was illustrated and described in our issue for March 11 last.

Proposed New Fever Hospital, Leeds.—At a meeting of the Leeds Sanitary Committee on the 18th ult., the scheme of Mr. Edwin T. Hall, architect, London, for the extension and completion of the Manston Infectious Hospital was adopted, and he was instructed to prepare detailed plans and specifications. The present mansion on the estate will be demolished, and a building erected on the site to form the official administrative block. This, together with the residence and offices for the assistant medical officers, the matron, and single men, are shown in the plan at the staff entrance to the hospital. Passing through the covered way, the residences for nurses and female servants are on the right and left, the kitchen, steward's stores, dispensary, and bakehouse being grouped on tne main covered way, which runs east and west. At the extreme north-east the existing pavilion is set apart for scarlet fever convalescents, with playing grounds attached. It is proposed to convert the adjacent staff block into a club-house for all the men employed in the hospital. The porter's lodge remains as at present. The position of the mortuary is retained, but the building will be increased in size and otherwise re-planned. An ambulance station, with stabling, is placed to the south of the mortuary. Opposite to the lodge will be placed the discharge block, with separate sets of rooms for scarlet fever and diphtheria, with waiting-rooms for visitors attached. A corresponding block to the east of the administrative block will contain accommodation for students, &c. The residence for the medical superintendent is placed in the outer zone, not far from the entrance gates. Owing to the difficulty of housing married men in this locality, at so great a distance from Leeds, a provision of sixteen cottages for married employés has been made in the locality. The present laundry is inadequate for the service of the completed hospital, and now that it is proposed to generate their own electricity, they will require a much larger engine-house and another boiler. Owing to the close proximity of other buildings, it is not practicable to enlarge the present laundry. The architect therefore proposes to take out all the interior of the present disinfecting block, and make it part of the laundry. All the pavilions are separated by a minimum distance of 100 ft. Each pavilion will be only one story high. The hospital, when completed, will provide the following accommodation:—Scarlet fever, in eight new pavilions, 240 beds; diphtheria, in two new pavilions, sixty beds; enteric diseases, in four existing pavilions, eighty-eight beds; isolation accommodation is provided in five pavilions (one existing, four new) for forty-eight; total, 436. The administration block will contain the committee-room, the offices of the medical superintendent, clerk, and matron's waiting-room, one large office for the assistant medical officers, chaplain's room; the residences of the matron, assistant medical officers, and of the six unmarried male servants. In this block it is also proposed to put a large room available for lectures, or for services for the staff. Each scarlet-fever pavilion will contain a vestibule, a hall, two wards of fourteen beds each, two wards of one bed each. The ward kitchen will be in the centre, entered from the hall, and having observation windows commanding all the four wards. On the opposite side of the hall will be a small store for linen and one for cooked meats. Each ward will be 26 ft. wide by 84 ft. long, and 13 ft. high. The windows will be carried right up to the ceiling. In the centre of each ward will be placed a faïence stack, with two fireplaces and aspirating flues placed near the ceiling. There will be open basements under the wards, from which the flues will be swept. The wards will be principally heated by means of low-pressure hot-water radiators. The small isolation pavilions will each consist of one four-bed ward, one two-bed ward, and one single-bed ward, with ward kitchen, larder, linen-room, a bath-room, with one fixed bath and one copper moveable bath for use in the separate wards. The existing typhoid pavilions each contain two ten-bed wards and two single-bed wards, with central ward kitchen opening into each large ward and to the hall, having observation windows looking into the small wards. The hospital will be connected throughout by covered ways of the same type as those already erected, but underneath these the architect proposes to put subways, high enough for a man to work in. These subways will contain the steam and electric mains, and steam heaters for the various blocks, cold-water pipes for general supply and for fire mains, telephone, and fire-alarm mains, &c. The hospital is to be erected of brick, with local stone dressings. The roofs will be slated. Internally the walls of the wards will be finished with cement, painted, and varnished. Lavatories, bath-rooms, &c., will have glazed-brick dadoes and divisions.

Fire and Police Station, Westbar, Sheffield.—This building is now being erected for the Corporation of Sheffield on a corner site at the junction of Westbar and Westbar Green. No portion of the building is less than three stories high, and the length of frontage is 175 ft. Welsh bricks are used for the facings, and Scotch stone for the dressings. The tower, the upper part of which is fitted up as a look-out, the lower part being used for drying hose pipes up to a 100 ft. in length, rises to a height of 80 ft. The police department is to the left of the tower. The fire department, to the right of the tower, will have the engines and one escape, stable for four horses, and a house for the superintendent. The whole of the upper floor is arranged as bedrooms, with lavatory and bath-rooms, for twenty single men, and the first floor has kitchen, dining, and recreation rooms for their daily use. White glazed bricks have been used for the walls of fire-engine-house, police-offices, and cells, and the floors will be of smooth-surfaced concrete. The general contract is in the hands of Messrs. Ash, Son, & Biggin; Messrs. Charles Chadwick & Sons have the slating and plastering, Messrs. Braithwaite & Co. the plumbing and glazing, Mr. Frank Tory the carving, Messrs. Bright Brothers the heating, the Gas Light Company is laying on the gas, and the building will also be fitted up with the electric light. The clerk of works is Mr. Walter Davison, and the architect Mr. Joseph Norton, of Sheffield.

Dewsbury District Infectious Hospital.—Plans for a Joint Infectious Hospital for Dewsbury, Heckmondwike, Ravensthorpe, Soothill Upper, and Soothill Nether have been prepared by Mr. Fox, architect, of Westgate, Dewsbury, and have been approved by the Joint Hospital Board. It is the intention of the Board not to proceed with the whole scheme at once, but only a portion of it. A site at Chickeney Wood has been secured. The hospital will consist of an entrance lodge, an administrative block, four pavilions (two for fever cases, one for diphtheria, and one as an isolation block), with washhouse and laundry, and a boiler and engine-house, containing disinfecting plant. There is also to be a mortuary. The buildings will be lighted by electricity, and will cost about 21,000*l*.

## *SANITARY AND ENGINEERING NEWS.*

Waterworks, Corley, Warwickshire.—The first stage of the scheme for providing the district of Foleshill, Exhall, Sowe, Wyken, Stoke, Binley, Keresley, and Corley with a new water supply has just been completed. Hitherto the area in question has derived its water supply from wells. The new supply is drawn from the Corley rock, a red sandstone formation. At Burrow Hill-lane a well of 10 ft. diameter has been sunk to a depth of 99 ft., and on an eminence near at hand a temporary reservoir has been constructed. Mr. J. Quick is the engineer.

Sewerage Works, Acton.—Colonel A. G. Durnford, R.E., Local Government Board Inspector, held an inquiry at the District Council Offices on the 16th inst., in reference to the application of the District Council for sanction to borrow 2,681*l*. for works of sewerage and surface-water drainage. Mr. D. J. Ebbetts is the surveyor.

Sewage Works, Barrhead, Renfrew.—The sewage purification works at Bowerwalls, Barrhead, were opened on the 15th inst. The works consist of two grit chambers, four septic tanks, and eight aërating bacterial filters, all of which are built in concrete. Each of the septic tanks is 100 ft. long by 18 ft. wide by 7 ft. deep at low water, and is entirely covered with concrete arches, carried by rolled steel joists and brick piers. The four tanks when filled to low-water level contain about 312,500 gallons. Each filter is 55 ft. long and 54 ft. wide, and is filled to a depth of 4 ft. with broken furnace clinker. The total filtering area is about 2,540 square yards. Six of the filters ordinarily form the working set, the other two being held in reserve. The engineers are Messrs. Cameron, Commin, & Martin, Exeter and Westminster.

## *FOREIGN.*

France.—One hundred and nine artists have taken part in the competition opened by the Government for designs for the diplomas for the awards in the 1900 Exhibition. The designs, on view in the Galerie des Machines, are all of a very mediocre character, and recall the exhibition of designs for postage-stamps, held about two years ago, which resulted in nothing. It is useful to remember this, for at the 1889 Exhibition the diploma was designed by Galland.——An interesting exhibition of pictures, drawings, and sketches by Puvis de Chavannes has been opened in the Galerie Durand Ruel. This exhibition, which closes on July 13, will be followed by a public sale.——The municipal administration are now restoring the façade of the Chapelle de la Sorbonne, which contains the tomb of Cardinal Richelieu.——A block of very large houses is now being built on the site of the old reservoirs, at the angle of the Rue de Constantinople and the Boulevard des Batignolles. These houses are being built from designs by M. Charles Lefebvre, architect, and they present a fine façade of 60 mètres in length, the monotony of which is broken by the bow windows thrown out, with columns, and cupolas over.——M. Falguière is to execute four decorative figures to ornament the pedestal for the monument for Victor Hugo, the principal figure being the work of M. Barrias. The four figures symbolise Tragedy, Comedy, Lyrical Poetry, and Satire.——The exhibition of the Beaux-Arts de Valenciennes will be held from September 24 to October 15. The exhibition of the "Union Artistique des Ardennes," which has just been opened at Charleville, will close on July 16; that of the Société des Amis des Arts of Douai will open its forty-fifth exhibition on July 9, to close on August 6. The similar Société at Grenoble will open its exhibition on July 15, to remain open till August 30.——An exhibition of the paintings of M. Fantin-Latour is being arranged at the Luxembourg.——We have to announce the decease, at the age of seventy-five, of the painter, Charles Julien de la Rochenoire. He was a pupil of Léon Cogniet, Gleyre, and Troyon. He devoted his talent to painting the pasture lands of Normandy, and exhibited at the Salon, from 1857 to 1879, landscape and cattle pictures which were much valued.

United States.—The list of names of the architects chosen to compete for the New York Custom House is of much interest, as showing the idea entertained at Washington of the professional rank of Eastern architects, or, at least, of the architects of New York and two other cities, which have, as yet, had no large Federal building erected under the new system. Of the New York architects, those invited are Messrs. McKim, Mead & White, George B. Post, Bruce Price, Carrère & Hastings, Francis H. Kimball, James B. Baker, Cady, Berg & See, Clinton & Russell, Robert W. Gibson, Israel & Harder, Babb, Cook & Willard, Henry J. Hardenbergh, Cass Gilbert, Trowbridge & Livingston, George Martin Huss, and Howard, Cauldwell, & Morgan; from Boston, Messrs. Peabody & Stearns and Shepley, Rutan & Coolidge are invited; and Messrs. D. H. Burnham & Co., and Henry Ives Cobb, from Chicago. It is evident that this selection is the work of one very well acquainted with professional matters, and it was probably left mainly to Mr. James Knox Taylor, the Supervising Architect of the Treasury. However this may be, the contrast between such a list and that which would have been made up in Washington not many years ago is instructive. All experienced members of the profession remember the nondescript creatures who, in the good old times, used to make their appearance as architects whenever a public building was in question. As a rule, no one in the profession had ever heard of them before, and after their public employment terminated they were not heard of again until a new State-house, or court-house, or asylum, or gaol had to be built at the taxpayers' expense; but, for some mysterious reason, they were always awarded the public work. Now, however, an officer of the Government is allowed, without protest, to think of artistic harmony in the erection of public buildings, instead of political harmony, and to make up his list of competitors in such a way as to endeavour to secure the former rather than the latter.——The new monument to Lafayette, which is to be presented to the French Government by the school children of the United States, is to be executed by Mr. Paul W. Bartlett and Mr. George G. Barnard, Mr. Bartlett carrying out the bronze equestrian statue of Lafayette, and Mr. Barnard undertaking the two groups in granite which adorn the pedestal. The architectural part has been entrusted to Mr. Henry F. Hornbostel, of New York. The presentation is to be made on July 1, 1900, but as it will be impossible to complete the bronze statue by that time, a model of it only will be unveiled. Messrs. Bartlett, Barnard, and Hornbostel were all students in Paris at the same time, and were regarded by the Art Committee of the Lafayette Memorial Commission as peculiarly qualified for their work.—*American Architect.*

## *MISCELLANEOUS.*

Professional and Business Announcements.—The partnership between Messrs. Spalding & Cross, architects, is terminated, and Mr. Cross has removed his office to 58, Conduit-street, Regent-street. Buildings still in course of erection from the designs of Messrs. Spalding & Cross will be completed under the joint supervision of Mr. Spalding and Mr. Cross.——Mr. George E. Withers and Mr. Percy W. Meredith, A.R.I.B.A., of Finsbury-pavement, have entered into partnership, and have arranged to carry on the practice of the late Mr. Charles Bell, F.R.I.B.A., architect and surveyor, at 3, Salters' Hall-court, Cannon-street, E.C.

Tamworth Castle.—Having been bought by the town as a memorial of the Queen's reign, for 3,000*l*., Tamworth Castle and its grounds—about three acres in area—were recently opened to the public. The original stronghold of the Mercian Kings Offa, Cenwulf, Beornwulf, and their successors, was rebuilt by Alfred the Great's daughter, Ethelfleda, last Queen of Mercia, and during two centuries after the Conquest the castle was held by the Marmions, descendants of Robert de Marmion, Lord of Fontenay, from whom it passed in succession to the de Freville, Ferrers, and Compton families, and ultimately to George, first Marquis of Townshend, who married the Lady Charlotte Compton, upon whom had devolved *jure matris* the baronies of Ferrers of Chartley, Lovaine, &c. Three rooms of Tamworth Castle will be used as a museum and picture gallery, and for the collection made by the local Natural History Society.

Appointment of Sanitary Inspectors.—The Local Government Board has sanctioned the appointment of Mr. E. Martin as a sanitary inspector in Greenwich, and the re-appointment of Mr. G. W. McQuinn as a sanitary inspector in Holborn.

Altar and Reredos, Church of Our Lady, Birkenhead.—On the 11th inst. a new high altar and reredos were dedicated in this church. The high altar is executed in Caen stone, and is approached by steps of Walplaquet marble. The altar-stone is supported on four columns of Labrador granite. The reredos is placed against the three walls of the apse. The whole of the work has been designed by Messrs. Pugin & Pugin, of London. The structural work has been carried out by Mr. Fogarty, Liverpool; the new altar by Messrs. Boulton & Sons, of Cheltenham; whilst the painted panels—three of which only have been done—are from the studios of Messrs. Hardman & Co., Birmingham.

Metropolitan Improvements.—In the list framed by the Improvements Committee of the London County Council, in respect of which they recommended that legislative action shall be taken in the course of the Session, 1900, are comprised the following projects:—(*a*) An extension of the riverside embankment between Lambeth Bridge and the Victoria Tower, with the improvement of the Smith-square and Millbank district, and the laying-out of a new street, 70 ft. wide, southwards from Old Palace-yard, and of a riverside garden; the net cost is estimated at 530,000*l.*, including the cost (74,000*l.*) of the works, towards which the St. Margaret and St. John Vestry will be asked to contribute 100,000*l.*, and the Committee propose that the Government shall undertake, at a calculated net cost of 130,300*l.*, the alteration of the Abingdon-street block; in respect of this project we may refer our readers to the *Builder* of January 29, 1898, which contains a leading article upon the somewhat similar scheme of a private body of "promoters," illustrated by various plans, including two prepared by the Editor;—(*b*) to widen Mare-street, Hackney, to 70 ft. between the Triangle and the North London Railway, the Vestry contributing 125,000*l.* to the net cost of about 577,000*l.*; (*c*) to widen Goswell-road to 60 ft. between Great Sutton and Upper Ashby streets, provided the Clerkenwell and St. Luke Vestries will jointly contribute 20,000*l.* towards the net cost, 209,500*l.*; (*d*) to widen Camberwell New-road between the Green and Warner-road at a cost of 52,000*l.*, towards which the Vestry of St. Giles, Camberwell, will be asked to contribute 5,000*l.*; and (*e*) to widen Nine Elms-lane to 60 ft. between Battersea Park-road and Southampton-street West, at a computed net cost of 136,400*l.*, subject to a contribution of 15,000*l.* from Battersea Vestry.

British Archæological Association.—The annual Congress will be held this year at Buxton, from Monday, July 17, to Saturday, July 22. On the Monday members and visitors will assemble at the town hall for the opening meeting at 4 p.m., and a conversazione will be given at the town hall at 8.30 p.m. On the Tuesday the party will leave Buxton for Bakewell, where the Vicar, the Rev. C. T. Abraham, will give some particulars of the recent discovery of old foundations at the west end of the church. Afterwards Chatsworth House will be visited, and Haddon Hall, returning to Buxton for the evening meeting at 8.30. On the Wednesday members will visit Tideswell, Eyam, and Stony Middleton. On the Thursday visits will be made to Arbor-low, where Dr. Brushfield and others will point out the chief features, and offer explanatory remarks upon the stone circles; Hartington, where the church will be described by the Rev. W. Fyldes, M.A.; and Alstonfield. On the Friday they will visit Castleton, and the Roman Camp at Brough will be visited on the way to Hathersage. The churches will be described by Mr. Blashill. On the Saturday some of the members will proceed to Ashford Church, thence to Taddington and to Chelmorton. The second party will visit the Roman roads and Roman camps at Dove Holes, and at the top of Coombs Moss, &c. Closing meeting at the town hall at 3 p.m. Arrangements will be made for extra days and excursions to Dove Dale, Ham, Poole's Cavern, Deepdale Cavern, &c., if members signify their wishes in this respect to the hon. sec. in good time during the Congress week. Meetings will be held in the town hall at 8.30 p.m. each evening (as far as practicable) from Tuesday, July 18, to Friday, July 21, inclusive, for the reading of papers and discussions. The following papers have already been promised: "On the Roman Remains of Buxton and the Neighbourhood," by Professor Boyd Dawkins, F.R.S.; "On the Roman Roads," by Rev. W. Fyldes, M.A.; "On Ashford Church," by Dr. Brushfield; "On the Archæological Discoveries of Micah Salt, Esq.," by Mr. John Ward; "On Castleton and the Castle of the Peverils," by Mr. Thomas Blashill; "On Rownesley Church," by Mrs. Collier; "On Bakewell Church," by Rev. Dr. Cox, F.S.A.; "The Family and Record History of Haddon," by Mr. W. A. Carrington; "The Architecture of Haddon Hall," by Mr. J. Alfred Gotch, F.S.A.; "On Tideswell Church," by the Rev. Canon Andrew; "On the Ancient Lead Mines of Derbyshire," by Dr. W. de Gray Birch, F.S.A.; "On the Pre-Norman Crosses of Bakewell, Eyam, and Hope," by Mr. Charles Lynam, F.S.A.; and "On Derbyshire Brasses," by Mr. Andrew Oliver. Those intending to join the excursion should communicate with the hon. secretary, Mr. G. Patrick, 16, Red Lion-square, W.C.

Master Builders' Association, Coalville.—A master builders' association has been formed for Coalville and district. A meeting was held recently, when this step was decided upon, and the combination has arranged to join the Midland Association, which is affiliated to the National Federation.

A Safety Casement Window.—The cleaning of the exterior of casement windows is an even more awkward matter than with sash windows, as, except with very small sashes, it is almost impossible to get the hand round to the back of it when open, or to the window next it on that side. The Crittall Manufacturing Company, of Braintree, have brought before us a model of an exceedingly simple contrivance for getting over this difficulty in iron casements. The casement frame is made in two parts, the portion holding the glass fitting within the outer frame. When the window is opened, a small clamp on the hinge side of the frame is loosened, and the inner portion with the glass can then be turned on a pivot working in the outer portion of the frame; not only bringing the outside of the glass round, but also enabling the hand to be passed through to clean the outside of the adjoining sash, if it should be a fixed one. There is nothing in the fitting of the double frame to interfere with its weather-tight quality, and nothing intricate or liable to get out of order; it is a contrivance at once simple and ingenious, and can be safely recommended to the attention of architects.

Institute of Sanitary Engineers.—At the half-yearly general meeting, held on the 15th inst., the following resolutions were unanimously carried:—1. That the minutes of the meeting held December 15, 1898, be confirmed. 2. That the balance-sheet and reports of the Governing Body and Auditor for 1898 as presented be adopted. 3. That, in addition to the present classes of "Fellows" and "Associates," a class of "Members" be established. 4. That for all Fellows, Members, or Associates joining after June 30, 1899, the entrance fees and annual subscriptions be uniform, irrespective of locality, as follows, viz.:—Fellows—entrance fee, 2*l.* 2s.; annual subscription, 2*l.* 2s. Members—entrance fee, 1*l.* 11s. 6d.; annual subscription, 1*l.* 11s. 6d.; Associates—entrance fee, 1*l.* 1s.; annual subscription, 1*l.* 1s. 5. That all belonging to or joining the Institute during the present year, whether Fellows, Members, or Associates, have the privilege of becoming Life Fellows, Life Members, or Life Associates, on the payment of ten guineas—five guineas before the end of the present month, or, in the case of new Members, within fourteen days of receiving notice of election, and five guineas on or before January 1, 1900. Life Members to be exempt from all further calls for subscriptions during their membership. The fees for Life Members after the expiration of the present year to be as follows, viz.:—Life Fellows, twenty guineas; Life Members, fifteen guineas; Life Associates, ten guineas.

The Carpenters' Company's Examination in Carpentry and Joinery.—This has been a record year in regard both to the numbers attending the series of lectures delivered to candidates previously to the examination and the number of entries for the examination itself. The lectures are intended primarily for the candidates for the examination; and, although, of course, purely technical, have attracted audiences of over a hundred. The examination took place, as usual, at the Company's Hall, and at their schools in Great Titchfield-street, last week. The number of candidates sitting this year exceeded that of all previous years by at least a third, and the number of successes is more than proportionately higher. The examiners included among their number Sir Alexander Binnie, Professors Banister Fletcher and T. Roger Smith, and Mr. Randall, President of the Institute of Builders. The names of the successful candidates in order of merit are:—*First Class.*—Wm. Bevan and F. J. Griffiths (silver medal); George Ellis, W. H. Richardson Jones, and Jno. Lawrence (bronze medals); W. O. Brown, Arthur Norton, J. E. Poynter, J. W. Appleyard, G. H. Griffiths, E. R. Livermore, W. H. Morrish, I. S. Knight, and Tom Pilgrim. *Second Class.*—S. W. Hayward, T. C. Noble, E. W. F. Martin, H. T. Barnes, A. D. Trendall, J. H. Sills, F. Tompkins, F. J. Allman, S. J. Stevens, D. Hunter, E. W. Bell, G. J. Boog, J. R. Heatley, F. Batten, F. C. Brown, A. E. Davis, C. H Hayward, E. J. Martin, R. H. Griffith, A. D. White, Thos. Tanton, W. Pither, and Jno. Perrin. Candidates already holding the Company's certificate, who came up to improve their position and failed to do so, do not appear in this list, although they may have maintained their former position.

Collapse of a Building in Mayfair.—A large building, which was formerly the residence of Lord Spencer, and which stands at the corner of Hay-hill, Grafton-street, and Dover-street, is in process of demolition, the intention being to erect flats upon the site. Two gangs of men, the house-breakers and the builder's workmen, were engaged at the scene, the latter being at work in the basement laying the foundations for the fresh building. While the other men were at work above pulling the old building down, suddenly, at half-past five, on the 19th inst., the upper floors of the structure collapsed, and there was a great uprising of dust, which for a time completely hid the scene from view. It was subsequently found that, while a couple of dozen men had had marvellous escapes, two others were missing. At ten minutes past seven one of the men was got out. He was terribly injured, and was at once removed to the St. George's Hospital. The dead body of the second man was discovered later on.

Surveyorship Appointment.—Mr. George Spalding Fleetwood, A.S.I., of New-court, Carey-street, has been appointed surveyor to the Corporation of the Orphan Working School, in place of the late Mr. George Fleetwood.

## *CAPITAL AND LABOUR.*

The Building Trade Dispute at Middlesbrough.—A joint meeting of the Middlesbrough Master Builders' Association and the Federated Builders' Labourers' Union was held on the 15th inst. at the office of Mr. Calvert Griffiths, the Master Builders' secretary. The following agreement was signed: "The men to return to work at the old rate of wages, which the masters undertake to pay for the next twelve months. The masters agree not to victimise any member of the union, and the men agree to work amicably with non-union men." It was also agreed to appoint a standing joint committee to consider and decide on working rules, and to settle any dispute which may occur in the future, work being proceeded with in the meantime. This agreement was arrived at on the understanding that the rules of the labourers are brought into harmony with those of the bricklayers.

Dumfries Masons' Strike.—Dumfries masons' strike, which had entered on its fourteenth week, has been settled by an agreement of the masters to give an advance of a halfpenny per hour instead of the penny demanded. The standard wage will now be 8½d., and employers are to be at liberty to pay a lower rate, not less than 7d., to men who are not fully competent tradesmen.

The Tunbridge Wells Building Trade.—The labourers of the Tunbridge Wells building trade, who ceased work until 6d. per hour instead of 5½d. was paid, have now resumed work, the increase having been conceded by the master builders.

Bricklayers' Strike in Germany.—Berlin bricklayers demand a further rise in their wages from 60 pfennige (sevenpence) to 65 pfennige an hour. Some of the employers have granted this but the Employers' Association opposes the demand, and to make their refusal more effective the members have locked out their workmen, even the not inconsiderable number—the so-called "localists"—who have not asked for more wages. The employers declare that they must put an end once and for all to the coercion exercised by the men, in order to remain masters on their own ground. As an answer to the general lock-out a general strike has been proclaimed by the leaders of the Bricklayers' Union, even including shops where the men's demands have been conceded. On account of the very mild winter and the consequent long period of uninterrupted work, the funds of the Union are in a very good condition. The Employers' Association, however, is well-prepared, and it appears as if the struggle might be a hard one. The employers think it lies in their interest that the scene of action should not be restricted to Berlin, and are trying to bring about a lock-out throughout the country. They have, therefore, issued the following circular to the Guild-masters all over Germany: "The movement to raise wages to 60 pfennige being scarcely over, the new demands prove to be a regular challenge to the employers, and a test of the power of the Social Democratic leaders, and they must be refused with all energy. As the workmen decided yesterday at their meeting that all unmarried bricklayers should leave Berlin and the suburbs, and give up their places to married comrades, we beg all our colleagues not to employ bricklayers from Berlin." A second circular has been addressed to purveyors of building material, who are asked not to supply builders who have not joined the Employers' Association, nor members of it who continue work on their buildings. Many employers have refused to be bound by the Association, and have declared themselves willing to pay the wages demanded. Several architects have also cancelled their contracts with employers who cannot fulfil their obligations owing to the lock-out. The struggle will, therefore, most probably end in the victory of the men.—*Daily News.*

Paisley Builders' Dispute Settled.—In connexion with the dispute between the labourers and master builders in Paisley, a joint conference was held recently between the President of the Building Trades' Federation and the secretary of the National Labourers' Union and a deputation from Paisley labourers. After discussion, it was decided that the men's wages should be increased to 5¾d., and that the plasterers' labourers have theirs raised to 6d. per hour six weeks hence. A suggestion that this agreement should regulate the wages for one year from July 1, and that no changes be made except annually, and then on three months' notice on either side, was remitted for consideration to a joint committee.

## *LEGAL.*

### ALLEGED INTERFERENCE WITH ANCIENT LIGHTS.

IN the Chancery Division of the High Court of Justice, on the 16th inst., before Mr. Justice Byrne, the case of Axford *v.* Fruen came on for hearing as a motion by the plaintiff for an injunction to restrain the defendant from an alleged interference with plaintiff's ancient lights.

Mr. Farwell, Q.C., and Mr. Carpmael appeared for the plaintiff, and Mr. Levett, Q.C., and Mr. Stone for the defendant.

Mr. Farwell said the plaintiff was tenant of a shop at 96a, Victoria-street, in which he sold curiosities and furniture. The defendant was his landlord. The plaintiff was tenant until December, 1902, of the premises in question. The frontage of the premises was 24 ft. 9 in.; the shop front was 10 ft. by 9 ft. 6 in.; and the shop stood back 11 ft. 6 in. from the road. The defendant had been building so as to put the plaintiff's shop into a well, as it were; he was building out on each side and raising walls on each side; and he was also building in front. Of course this materially interfered with the plaintiff's enjoyment of the premises. The defendant had suggested that the plaintiff had agreed to allow him to do what he had done. That was a question of fact, but on the evidence it appeared to him (counsel) to be perfectly plain that this was not agreed to by the plaintiff. The defendant suggested he had had a number of verbal conversations with the plaintiff and he had to get the permission of the London County Council. He applied to the plaintiff to get his consent as the London County Council asked for it, and the plaintiff had a letter written by him to the County Council refusing to give that consent. How in the face of that letter the defendant could say the plaintiff gave his consent he (counsel) could not really make out.

Mr. Stone said that one of the defendant's points was consent, and that the plaintiff thereby acquiesced in what was done. Whether this was a binding legal agreement or not, he submitted, did not affect the question. Beyond that, the plaintiff saw the defendant building up these two walls, waited until the work was practically finished, and it was not until the defendant had practically finished the work, and until he had pulled down a staircase, that the plaintiff took action. These were his (counsel's) points on the facts, and there were also points of law.

After some further discussion the motion stood over for a few days to enable the parties to try to arrange matters.

### THE WORKMEN'S COMPENSATION ACT, 1897.

MEADS *v.* HAWKINS.

THIS was a case (tried at the Reading County Court recently) under the Workmen's Compensation Act, in which John Meads, a painter, sued Mr. Hawkins, builder, of Reading, for 50 per cent. of his wages, in consequence of injuries received while engaged at his work. Mr. A. H. Spokes (instructed by Messrs. Brain & Brain) appeared for the applicant, and Mr. Powell (instructed by Messrs. Sarjeant & Gosling) for the respondent.

Mr. Spokes said the action was brought under Section 7.

Mr. Powell, in answer to his Honour, said the point he should raise was that the case did not come within the Act. There was a question as to the scaffolding, though he did not agree also as to the statement of the facts.

John Meads, the applicant, stated that the accident occurred on December 19. His average wages were 1*l.* 8s. per week. The building on which he was employed was the Swansea-road Board School, and Mr. Hawkins was the contractor for it. The height of the building was over 30 ft. Witness was engaged in painting an iron girder over the south staircase when the accident happened. The staircase was on the top floor. Witness was standing on the ladder with a man at the foot. There were two ladders spliced together; they had been spliced by the foreman painter. A rung of the ladder gave way with him, and he fell against a fanlight, which gave way, and he then fell on to the landing. Witness had been unable to do any work since, and could not stand now without the assistance of a stick. Witness had seen scaffolding on the centre staircase. There was scaffolding outside the building to the height of about 13 ft. There had also been scaffolding on the staircase on which he was engaged. Had the scaffolding remained there, it would have been easier and safer for him to do his work.

Cross-examined: The scaffolding was on the south staircase when the men were pointing the brick work and building the wall up. There was scaffolding in most of the rooms. The scaffolding, of which he had spoken, as being outside the building, was not outside that against which he was working. There was also scaffolding in the big room on the ground floor the week previous to his accident. The scaffolding he spoke of consisted of planks and trestles, and long poles for ledgers.

Evidence having been given by Dr. Guilding, Alfred Annetts, a painter, said he had been engaged on the same work as Meads. There had been a plasterer's scaffolding on the very staircase on which Meads had been employed, about 2 ft. 6 in. high. There was also scaffolding at other parts of the building. On the same day that Meads met with his accident some of this scaffolding was in use.

William Hawkins, the contractor for the buildings, said he saw the building on the day the accident occurred. There was no work of construction going on on that day at all, and there was no scaffolding outside or inside the main building.

Cross-examined: For the purpose of the building he had used scaffolding, but it had been taken down. There was no scaffolding on the centre staircase on the day the accident happened. It would not have been possible, nor would it have paid to have put scaffolding on the staircase on which Meads was working.

W. H. Hancock, the general foreman, stated that on December 19 there was no scaffolding outside or inside the building. There was a plasterers' stage on the centre staircase.

Cross-examined: The plasterers' stage was composed of scaffold boards, but it was only a temporary erection.

George White said he was clerk of works in the employ of the Reading School Board. The scaffolding was all removed from the main building on November 2. It was not proper to call plasterers' staging scaffolding.

Mr. Spokes contended that what Parliament intended was that if there were an important building, 30 ft. high, being erected, by means of scaffolding, that then the Act should apply. This building was being constructed by means of scaffolding. Before the plastering and painting work was finished, it could not be said that the construction was completed. Mr. Spokes also contended that the staging was scaffolding, and that the "building" included all the buildings within the curtilage.

His Honour, in giving judgment, said he need not remind them of the peculiarities of the Act. He also expressed his sorrow for the applicant, and his hearty wish that greater care was taken for the safety of the lives and limbs of workmen. The first point to consider was whether the "building" here was not merely the main building, but included the subsidiary buildings, and especially the cookery school. He held that the main building was to be considered separate; it was separate in point of fact; it was separate physically, and it also belonged to a different contract from the one under which the cookery school and metal shop had been constructed. The next was a very important question, whether this main building was "being constructed." He had to decide on the meaning of the word "construction," and he had to do so by the light of the judgment of the Lords Justices in the appeal in the case of Wood, recently decided. What they held was that painting was not "repairs," and not "construction." He did not mean to say that the judgment he was giving was not open to fair criticism and argument, and he dared say it might receive it, but that judgment was law to him. Mr. Spokes had pointed out that in the case quoted the operation was painting only, while here there was a contract for construction, and that the construction could not be considered complete until the plastering and painting was all done. There was a good deal to be said for that argument, but he was unable to say that this building was "being constructed," because there was practically only the painting work to be done. With regard to the plasterer's stage being "scaffolding," his opinion would probably be against the plaintiff, but on that point he did not now decide positively. His Honour also held that though machinery driven by steam had been used in the construction of the building, it was not "being used," as the construction was finished. The result was that the unfortunate plaintiff was not within the purview of the Act, and he must give judgment for the defendant with costs.

Mr. Spokes urged that the case was very near the line, but his Honour said that he always let costs follow the event.

Mr. Powell said that compensation was offered, but declined.

### CLAIM AGAINST CONTRACTORS UNDER THE WORKMEN'S COMPENSATION ACT, 1897.

THE case of Skeggs *v.* Keen came before the Court of Appeal, composed of Lord Justice A. L. Smith, Lord Justice Rigby, and Lord Justice Vaughan-Williams, on the 17th inst., on the appeal of the plaintiff from an award of Judge Addison, Q.C., sitting at the Southwark County Court, under the Workmen's Compensation Act, 1897. It appeared that Skeggs was in the employment of Messrs. A. & P. Keen, contractors, and was injured while in the course of his employment by falling off a ladder. Skeggs first brought an action against the respondents under the Employer's Liability Act, 1880, in the Southwark County Court, alleging that the ladder was defective, but the jury on December 13, 1898, found that the ladder was not defective and returned a verdict for the respondents and the action was dismissed with costs. At the request of the appellant the Judge thereupon proceeded to assess compensation under Section I, Sub-Section 4, of the Workmen's Compensation Act, 1897. The Judge assessed the compensation at the request of both parties, at a lump sum instead of a weekly payment, and he awarded the appellant Skeggs 23*l.* 4s. No application was then made by Skeggs for costs but his solicitor carried in a bill of costs. There were applications made in respect both of this bill of costs and of the respondents' bill of costs in the action, and on April 10, last, the Judge, after stating that the respondents were willing to and did admit their liability under the Workmen's Compensation Act, 1897, but refused to make an offer under the Employers' Liability Acts, 1880, as they considered that the appellant had no case under that Act, but the action was brought instead, said he found as a fact that all the costs with one immaterial exception which the defendants had incurred had been occasioned by the plaintiff bringing his action under the Act of 1880. He also decided that there was no jurisdiction to give the plaintiff any costs.

In the result their Lordships upheld the decision of the County Court Judge, and dismissed the appeal with costs.

Mr. Cyril Dodd, Q.C., and Mr. Moyses appeared for the plaintiff (appellant); and Mr. Lawson Walton, Q.C., and Mr. Ellis Hill for the defendants.

### THE HULL LIGHT DISPUTE.

THE case of Jordeson *v.* the Sutton, Southcoates, & Drypool Gas Company and Others came before the Court of Appeal, composed of the Master of the Rolls, the President of the Probate Division, and Lord Justice Romer, on the 21st inst., on the application of the defendant company for a stay of execution pending their appeal to the House of Lords. It will be remembered that the action was brought by the plaintiff in respect of injury to some small houses belonging to him in Hull during the construction by the defendants of a large gas-holder and of prospective obstruction of access of light to the windows of such houses, Messrs. Holme & King, the contractors, being joined with the company as defendants. Mr. Justice North awarded the plaintiff 340*l.* damages for the injury actually done, his judgment being affirmed in the Court of Appeal.

Their Lordships granted a stay of execution as to costs only, the damages having been paid.

### ACTION AGAINST THE LONDON COUNTY COUNCIL BY A DEPTFORD TRADESMAN.

THE case of Martin *v.* the London County Council came before the Court of Appeal, composed of Lord Justices A. L. Smith, Rigby, and Vaughan Williams, on the 20th and 21st insts., on the appeal of the plaintiff from the decision of Mr. Justice Kennedy giving judgment for the defendants.

The action was brought against the defendants for unnecessarily and negligently blocking and obstructing Wellington-street, Deptford and other thoroughfares leading to that street, in which the plaintiff resided as a leaseholder. It was alleged that in 1897, whilst making a new road cutting Wellington-street diagonally under their statutory powers the County Council were guilty of unreasonable delay, and of obstructing the approaches to the street at more points and in greater degree than was necessary, with the result that the receipts of the plaintiff in his business fell off to such an extent that he had to surrender his lease and lost his interest therein, and the goodwill of his business as a greengrocer, after incurring extra expense and labour in getting his goods to his shop and from his shop to his customers. It was asserted that for some months the High-street ends of Watergate-street and Wellington-street were blocked up entirely (save for a narrow gangway) and a board put up marked "no thoroughfare"; that at the other end Wellington-street was blocked up as far as Armada-street and a similar board placed there; that the gangway which had been left for foot-passengers was almost impassable owing to piles of sand and rubbish which had been heaped up close to it; and that the whole roadway was needlessly blocked by road-making material. The learned Judge left to the jury the questions whether there had been unnecessary delay and obstruction, and the amount of the damage to the plaintiff, if any. The jury being unable to agree, were discharged. The defendants then moved that judgment might be entered for them on the following points:—(1) That even assuming defendants had been guilty of unreasonable delay or obstruction and damage had resulted to the plaintiff no action would lie. (2) That the plaintiff had not shown any substantial damage attributable solely to these acts. (3) That if there was any evidence of special damage, it was not so particular to the plaintiff as to give him a cause of action. The plaintiff submitted that the undertakers of all public works authorised by statute were responsible for injuries peculiar to the person, or the limited section of persons aggrieved by injuries which had been inflicted by an improper or unreasonable exercise of the powers conferred upon them. Mr. Justice Kennedy held that the circumstances were not such as would give the plaintiff a right of action, and entered judgment for the defendants with costs, except the costs of the special jury.

Their Lordships, without calling upon counsel for the respondents, dismissed the appeal with costs.

Mr. Atherley Jones, Q.C., and Mr. W. M. Thompson appeared for the appellant, and Mr. H. F. Dickins, Q.C., and Mr. Daldy for the defendants.

◆

## MEETINGS.

### SATURDAY, JUNE 24.

*People's Palace Architectural Society.*—Mr. S. Posenheim on "Defects in Plumbing Work." 7.30 p.m.

*London and Provincial Builders' Foremen's Association (Memorial Hall Farringdon-street).*—Monthly Meeting.

### MONDAY, JUNE 26.

*Royal Institute of British Architects.*—Presentation of the Royal Gold Medal to Mr. G. F. Bodley, A.R.A. 8 p.m.

### TUESDAY, JUNE 27.

*Royal Institute of British Architects.* — Annual Dinner, at the Whitehall Rooms, Hôtel Métropole. 7.15 for 7.30 p.m.

### WEDNESDAY, JUNE 28.

*Builders' Foremen and Clerks of Works' Institution.*—Half-yearly meeting of the directors. 8 p.m.

### THURSDAY, JUNE 29.

*Incorporated Association of Municipal and County Engineers.*—Annual meeting at Cardiff.

### FRIDAY, JUNE 30.

*Incorporated Association of Municipal and County Engineers.*—Annual meeting (continued).

### SATURDAY, JULY 1.

*Incorporated Association of Municipal and County Engineers.*—Annual meeting (concluded).

*Northern Architectural Association.*—Annual Excursion. Members to assemble at the Central Station, Newcastle, at 10.30 a.m. They will then drive to Belsay, where, by permission of Sir Arthur Middleton, Belsay Castle and Hall will be inspected. Whalton Church will be next visited, and the party will return to Newcastle viâ Ogle and Kirkley, and will dine together at the Central Station Hotel, at 7 p.m.

◆

## RECENT PATENTS:

### ACCEPTED SPECIFICATIONS.

### *Open to Opposition until August 14.*

[1898] 12,511, Riebensham and others, Incandescent Electrical Lamps. 12,967, Kurfu Metal Syndicate & Fullerton, Ball and Float Valves. 13,048, Ljungman & Unden, a Grinding Tool. 13,677, Cox, Appliances for Boring the Earth and Removing the Excavated Material from the Bore. 13,942, Thomson, Combined Standard and Portable Electrical Light. 14,222, Cory & Reynolds, and 16,918, Andrews, Circular-saw Guard. 14,997, Wild, Purification of Sewage, &c. 15,083, Simmance & Abady, Gas Regulators. 15,256, Renbold, Securing Instruments to Tripod Stands, &c. 15,958, Kohl, Glow-bodies for Incandesence Burners. 16,005, Green, Cooling Air and its Supply in Cellars, Chambers, &c. 16,164, Sinclair & Aitken, Telephone Exchange Systems. 16,417, Burridge, Kilns or Ovens for Firing Bricks, &c. 16,421, Muirhead, Manhole, Sludge, Mudhole, and similar Doors. 16,457, Berger, 17,088, Schumacher, 27,252, Gossweiler, and [1899] 8,339, Küppers & Schroeder, Generation of Acetylene Gas. 16,665, Smidth & Rüsager, and [1899] 5,477, von Krottnaurer, Kilns for Burning Cement, &c. 16,989, Daw & Daw, Feed Mechanism for Percussive Rock Drills. 17,360, Osborn, Manufacture and Hanging of Wall-Papers. 17,433, Howell & Attwood, Sinking-Pumps for Mines and other Services. 17,556, Aspinalls, Safety Gear for Hoists and Lifts. 17,997, Millers, and [1899] 6,602, Hedgeland, Acetylene Gas Lamps. 19,307, Von Vietinghoff-Scheel, Gas Lighter. 20,350, Wegener, Furnaces for Household Refuse, &c. 20,489, Pilcher, Accommodation Ladders. 21,644, Craws, Fire Screens, Draught Regulators, and Fire Guards. 22,722, Kinnell, Fittings for Hot-Water Circulation Pipes. 25,046, Cope, Heating Apparatus for Floors, Kilns, or Ovens. [1899] 645, Sturt, Means for Producing Designs for Mosaics, Carpets, Wall Papers, &c. 2,215, Langley, Chimney Cowls. 3,548, Aisbitt, Miller, & Jones, and 5,019, Pocock, Bishop, & Smith, Oil Lamps and Lanterns. 4,834, Schlesinger, Adjustable Pendants for Lamps, &c. 4,998, Wood, Gin Saw Filing Machines. 5,262, Hall, Electrical Tumbler and other Switches. 5,527, Bennett, Saw-Setting Devices. 5,723, Rawie, Locks. 6,331, Adam, Oil or Vapour Burners, principally Adapted for Cooking Purposes. 7,124, Conrad, Incandescent Gas Burners. 7,652-3, Eissler & Strache, Valves for Water-Gas Generating Apparatus. 7,699, Krause, Filters. 7,759, Topp, Decorating Polished Wood Surfaces. 7,849, Merrill, Hospital Sink and Wash Tub. 8,640, Cassal, Tool Holders or Cutter Bars for Lathes. 9,118, Dunn & Harrison, Computing Weighing Apparatus. 9,198, Wilmot, Metal Tubes. 9,566, Gray, Electrical Safety Fuses. 9,594, Mayer, Removal of Dust from Grinding and other Machines. 9,639, Lang, Lathe Beds. 9,691, Clarke & Dunmore, Water-Waste Preventers. 9,719, Littlefield, Valve Apparatus. 9,771, Rosenbaum & Murphy, Faced Bricks. 9,814, Shutterly, Dials for Watches and other Instruments. 9,910, Howson, Siphon Water Closets.

### ABSTRACTS OF PATENTED INVENTIONS.

3,905.—SUSPENDING LAMPS: *P. G. Pasquet.*—Three projections from a yoke fastened to the ceiling or wall support a hollow ball carrying a tube in which slides another tube by which the lamp or burner is suspended; the former tube may be extended above the ball in order to carry either a counterweight, or the upper portion of the ball made solid to act as a counterweight; and gas or electricity may be supplied by means of flexible tubing or conductors respectively.

3,914.—PURIFICATION OF ACETYLENE: *L. Etaix.*—In order to separate the sulphuretted hydrogen and phosphides of hydrogen, the acetylene is passed through chloride of lime or any alkaline or alkaline earth hypochlorite, or through a solution thereof; by passing the gas over or through a solution of caustic soda or potash, the chlorine vapours it has taken up are then removed.

3,916.—WINCHES: *J. B. Furneaux.*—For winding, the barrel engages, in one direction, by means of ratchet teeth, with the driving spur-wheels; for unwinding, the barrel is disengaged, and a band-brake controls its rotation, whilst a hand-wheel and nut upon the shaft, engaging with a flange upon the boss of the barrel, effect the barrel's endwise motion; the spur-wheel and barrel will be separated farther apart by the driving of the nut by frictional contact during the paying-out.

3,943.—SASH FASTENINGS: *A. W. Borlase.*—On the lower sash is pivotted a socket-piece which engages automatically with a spring-hook upon the upper sash when the sashes are closed—the hook's head being bevelled that it may enter into the socket; the socket-piece is turned out of the way when the sashes are open.

3,977.—APPLIANCE FOR CLOSING WINDOWS: *E. B. Kubasch.*—A fan, mounted upon a shaft outside the window, is adapted to close the sashes when it is struck by a strong current of air; to the drum of the shaft is attached a cord which after passing over guide-pulleys is fastened to a swinging sash, which is thereupon closed by the fan's rotation in either direction; an adjustable brake is provided to prevent the operation of the contrivance when exposed to only light winds.

4,017.—VICES: *G. B. Jones.*—The recessed jaws rotate upon a horizontal axis, the stem of one jaw turns in a fixed part, and the stem of the other (and adjustable) jaw slides, without turning, in the stem of the former, upon a nut that passes through slots to engage with tapering grooves in the one jaw are wings which prevent the adjustable jaw from turning, the nut becomes jammed in the grooves when the vice is tightly screwed-up, and it may be removed and renewed by taking off the end cap and entrely unscrewing the spindle screw.

4,026.—SAFETY-HOLDING APPARATUS FOR HOISTS, LIFTS, &C.: *G. Bauer.*—The lifting rope is secured to a loop, which is connected by means of links to a frame, having springs upon its sides, that travels between guides, and other links sustain a board from which a cage is suspended. If, then, the rope breaks the sides of the frame open asunder and become jammed by the action of the cage upon the links, which serve the purpose of toggle-levers.

4,051.—PREVENTION OF FIRE: *R. Buggé.*—The inventor seeks to prevent fire from spreading from one building to another. His method is to hang a screen of coarse woollen cloth, which is saturated with water by a perforated hose pipe laid along its top, over the side of the building that is to be protected, and he makes rows of pockets on the screen's front for holding and distributing the water. In a varied form the screen is formed of an endless band turning upon top and bottom rollers, the bottom roller being put into a trough filled with water.

4,066.—JOINTS FOR SEWER, GAS, WATER, AND OTHER PIPES, AND FOR TUBES FOR ELECTRICAL CABLES: *J. W. Brown.*—As an improvement of No. 8,526 of 1897 the shoulder and end of the spigot are formed with recesses for rings of compressible materials, such as rubber, hemp, or felt, to be forced home by end-pressure, and cement or molten lead run in through a channel; by another method the rings are cemented to the socket's shoulder, or angle-rings may be attached to the spigot-end and shoulder.

4,119. — SURFACE DRAINAGE: *J. Walker.* — The appliance is devised in respect of surface drainage gulleys for water-closet and wash-bowls, sinks, urinals, and so on, discharging into pipes and sewers; when the grid is in its place the bottom of a transverse plate attached to the grid rests below the water level, and so serves to trap foul gases, any excess of water flowing through a removeable side grating to the discharge pipe, a non-return valve obstructs the passage of tidal and other water from the sewer to the trap.

4,133.—GRAPHICAL DEMONSTRATION OF TRIGONOMETRY: *G. W. Ugill & F. J. Browne.*—Geometrical figures, mounted on a card or in a book, rotate about centres over other figures or diagrams marked upon the card; for example, to demonstrate the variations of the the trigometrical functions of an angle as it varies through 90 deg., two equal wheels are geared at the back of a board by a rack, so that they can be turned together by another wheel. A right-angled piece is connected to two cranks upon the axes of the two equal wheels, one of which has a radial arm. As the wheels are turned round, the radial arm and the right-angled piece, which moves parallel-wise with itself, show, in conjunction with co-ordinates marked upon the board, the variations of the functions. Similarly, a radial arm moves over a quadrant marked upon the board, and having tangents drawn at its limiting radii; and a celluloid right-angled triangle, turning about its right-angle, shows the relations between the functions of an angle and its complement.

4,147.—WATER-CLOSET BASINS: *J. J. Inglis.*—The thickness of the wall behind the basin is reduced in order that the outlet may be directly attached to the junction length in the soil-pipe, which is fitted with an inspection opening: the basin has two flushing horns.

4,190.—TRAPS FOR DRAINS: *H. T. Bush.*—The outlet passes from the side of a cylinder, at the bottom of which is the inlet arranged tandem-wise, to prevent breakage of the seal the top and bottom spaces of the cylinder are made equal in amount.

4,234.—VENTILATION OF DRAINS AND SEWERS: *F. G. S. Ham.*—A dirt-box, with a central pipe whereof a balanced aluminium flap covers the lower end, is hung below the ordinary man-hole cover, the pipe is horizontally divided, side openings being provided for the admission of air.

4,241.—SIPHON DISCHARGE FOR WATER WASTE-PREVENTERS: *H. Sutcliffe.*—In the tank is mounted a large-bored siphon, whose action is started by means of a plunger that operates within a spherical chamber beneath the siphon's short arm, the discharge pipe is connected directly with the horn of the closet basin, to which it is secured by a packing-ring and a gland.

4,246.—DECORATION OF TILES, POTTERY, &C., BEFORE FIRING: *W. Maguire.*—In an aperature of the lid of a box made in compartments is a stencil plate on which the pottery or tiles are placed, each of the compartments being provided with a tray for glaze or liquid colour, a rotary brush upon a spindle that passes through all of the compartments, and a roller that passes the colour on to the brush; when the brush is revolved by a handle outside, it turns the roller round and splashes the colour upwards through the stencil plate on to the tile; paper transfers for ornamenting tiles and pottery ware may be similarly prepared.

4,274.—BREAKING-UP ROADS: *H. Morrison.*—The carriers of the cutters are lowered and raised by a rack and worm gear, turned by a spindle, either cutter being lifted up when the other is at work, the carriers can be arranged so as to rotate in their cylinders and thus to act either in front of or behind the scarifier.

## TO CORRESPONDENTS.

W. J. J. (We cannot print your letter).—J. W. B., M. & F. (Amount should have been stated).—B. D. (Below our limit).

NOTE.—The responsibility of signed articles, letters, and papers read at public meetings, rests, of course, with the authors.

*We cannot undertake to return rejected communications.*

Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

We are compelled to decline pointing out books and giving addresses.

Any commission to a contributor to write an article is given subject to the approval of the article, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and *not* to the Editor.

## TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us *not later than* 10 *a.m. on Thursdays.* N.B.—We cannot publish Tenders unless authenticated by the name and address of the sender; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is given, nor any list in which the lowest Tender is under £100, unless in some exceptional cases and for special reasons.]

* Denotes *accepted.* † Denotes *provisionally accepted.*

## COMPETITION.

### THE VESTRY OF ST. MARTIN-IN-THE-FIELDS GIVE NOTICE

That they are desirous of obtaining DESIGNS for ELECTRIC LAMP STANDARDS and BRACKETS.

A premium of 10*l*. will be given for the design which the Vestry may consider the most suitable for the purpose, and a premium of 5*l*. for the second, the accepted designs to remain the property of the Vestry.

Full particulars may be obtained by applying to the Surveyor to the Vestry (Mr. GEORGE GREEN, C.E.), at the Town Hall.

The designs must be forwarded to the undersigned not later than the 8th day of JULY next.

By order,
G. W. MURNANE,
Clerk to the Vestry.

St. Martin's Town Hall,
Charing Cross-road, W.C.
June 20th, 1899.

## CONTRACTS.

### TO BUILDERS, CONTRACTORS, and OTHERS.

The London County Council is prepared to receive TENDERS for Works to be executed in connexion with the REMOVAL of the eight existing BOILERS, and the Breaking-up and Clearing away of their Seatings; also the CONSTRUCTION of FOUR new BOILER SEATINGS and an ECONOMISER CHAMBER, together with certain Flues, &c. at the Western Pumping Station, Grosvenor-road, Pimlico.

Persons desiring to submit Tenders may obtain uncoloured drawings and the specifications, bills of quantities, form of Tender, and other particulars at the Engineer's Department, County Hall, Spring-gardens, S.W. upon payment of the sum of 3*l*.

This amount will, after the Council or its Committee has come to a decision upon the Tenders received, but not before, be returned to the Tenderer, provided he shall have sent in a bonâ-fide Tender and not have withdrawn the same.

Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with.

The contractors will be bound by the contract to pay to all workmen (except a reasonable number of legally bound apprentices) employed by them wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule.

Tenders are to be delivered at the County Hall in a sealed cover addressed to the Clerk of the London County Council, and marked "Tender for Boiler Seatings, Western Pumping Station."

No Tender will be received after TEN a.m. on TUESDAY, 11th JULY, 1899.

Any tender which does not comply with the printed instructions for Tender may be rejected.

The Council does not bind itself to accept the lowest or any Tender, and it will not accept the Tender of any person or firm who shall on any previous occasion have withdrawn a Tender after the same has been opened, unless the reasons for the withdrawal were satisfactory to the Council.

C. J. STEWART,
Clerk of the Council.

Spring Gardens, S.W.
June 20th, 1899.

### CONTRACTORS and Others.—The Stone

Court Chalk Land and Pier Company, Limited, are prepared to QUOTE for SUPPLYING, at their pier head or elsewhere. CHALK, SAND, GRAVEL, FLINTS, &c. in large or small quantities. —Apply to Mr. J. HEWITT, Manager, Stone-court, Greenhithe, Kent.

### CITY of SHEFFIELD.

The City Hospitals Committee of the Corporation invite TENDERS for the whole, or any portion, of the work required in the ERECTION of INFECTIOUS DISEASES HOSPITAL, at Lodge Moor, Sheffield, comprising Six Pavilions for Scarlet Fever Patients, Two Isolation Pavilions, One Receiving Pavilion, Administrative Buildings, Nurses and Maids' Homes, Water Tower, &c.

Also Tenders for HEATING APPARATUS and for COOKING APPARATUS, &c.

Drawings and specifications may be seen, and bills of quantities obtained, on application to the Architects, Messrs. FLOCKTON, GIBBS, & FLOCKTON, 15, St. James's-row, Sheffield, on and after WEDNESDAY, JUNE 7th.

Tenders, endorsed "Lodge Moor Hospital," to be sent in not later than JULY 3rd, 1899, addressed the Chairman and Committee, &c. Hospitals Committee, Town Hall, Sheffield.

The Committee do not bind themselves to accept the lowest or any Tender.

By order,
HENRY SAYER,
Town Clerk.

Town Clerk's Office,
Town Hall, Sheffield,
May 25th, 1899.

N.B.—The contract will comprise the fair wages and conditions of labour clause which has been adopted by the Sheffield Corporation, particulars of which will appear in the general conditions.

### BOROUGH of SOUTHWOLD.

NOTICE.

The Corporation invite TENDERS for CONSTRUCTING WORKS OF CLIFF PROTECTION and supplying the necessary plant, utensils, materials, labour, and other articles requisite for carrying out the work in accordance with the plans and specification, which can be inspected at the Office of the Borough Surveyor (Mr. F. BALL), Town Hall, Southwold.

The person whose Tender is accepted will be required to commence the works immediately upon the signing of the contract, and to complete the same to the entire satisfaction of the Borough Surveyor, under whose supervision the work will be carried out, within two months as to one section, and within four calendar months for the remainder of the work, from the date of the signing of the contract.

The contractor will be required to enter into a contract and bond for the due performance of the work, a copy of which contract can be inspected at my Office.

The Corporation do not bind themselves to accept the lowest or any Tender.

Tenders, endorsed "Tender *re* Cliff Protection," are to be addressed to me and delivered at my Office not later than FOUR o'clock in the afternoon on THURSDAY, the 13th day of JULY, 1899.

Dated this 20th day of June, 1899.

ERNEST R. COOPER,
Town Clerk.

Town Clerk's Office,
Southwold.

### BOROUGH of SHOREDITCH.

FLEMMING STREET DEPOT.

The Shoreditch Vestry invite TENDERS for the ERECTION and COMPLETION of WORKSHOPS, STORES, and OFFICES, at their Flemming-street Depot, and the BUILDING of an ADDITION at rear of No. 15, Little Essex-street, adjoining.

The plans, specification, and conditions of contract may be seen at the Office of the Surveyor to the Vestry, Town Hall, Old-street, E.C. and a bill of quantities, with form of Tender, obtained on payment of a deposit of 2*l*. which will be returned to those who send in a bonâ-fide Tender. Two approved securities in the sum of 250*l*. each must be provided, and Trade Union wages and hours observed, &c. and no sub-letting will be allowed.

Sealed Tenders, endorsed "Flemming-street Depot," to be delivered at my Office not later than NOON on WEDNESDAY, the 12th JULY, 1899.

The Vestry do not bind themselves to accept the lowest or any Tender.

By order,
(Signed) H. MANSFIELD ROBINSON,
Solicitor and Vestry Clerk.

Town Hall, Old-street, E.C.
June 19th, 1899.

### TO BUILDERS and CONTRACTORS.

The Erith School Board are prepared to receive TENDERS for the ERECTION of FOUR ADDITIONAL CLASS-ROOMS to the Picardy Schools, at Belvedere, Kent, to accommodate 240 additional children.

Drawings and specifications and conditions of contract may be inspected at the Offices of Messrs. FORD, SON, & BURROWS, Architects, 21, Aldermanbury, E.C. where copies of the bills of quantities can be obtained on payment of Two Guineas, which amount will be returned upon receipt of a bonâ-fide Tender.

The Board expressly stipulate, by the conditions of contract that the contractor shall not sublet any portion of the work under a penalty of 25*l*. in each case, and that the standard rates of wages shall be paid to all workmen, and the recognised hours of labour in the district observed, also under a penalty of 10*l*. in each case.

The Board do not bind themselves to accept the lowest or any Tender unless approved.

Tenders to be delivered at the Architect's Offices on the 10th JULY, 1899, at TWELVE o'clock noon.

### SOUTH MIMS RURAL DISTRICT COUNCIL.

POTTERS BAR SEWERAGE AND OUTFALL WORKS.
TO SEWER CONTRACTORS AND OTHERS.

Notice is hereby given that the Council are prepared to receive TENDERS for the CONSTRUCTION of PIPE SEWERS, together with Manholes, Ventilating Shafts, Screening Chambers, and Outfall and other Works in connexion therewith.

The drawings, specification, and conditions of contract, may be seen on application to Mr. W. H. MANSBRIDGE, the Surveyor to the Council, at his Office, 40, High-street, Barnet, on and after MONDAY, JUNE 19th.

Tenders, sealed and endorsed, "Potters Bar Sewerage," to be addressed and delivered to me not later than TUESDAY, JULY 11th, 1899.

G. D. BYFIELD,
Clerk to the Council.

No. 16, High-street, Barnet,
June 16th, 1899.

**CONTRACTS** (*continued from p.* iv.)

## TYNEMOUTH CORPORATION

WATER.
FONT SUPPLY, 1899. MOORHOUSES RESERVOIR.
CONTRACT No. 1.

The Tynemouth Corporation are prepared to receive TENDERS from competent persons willing to enter into a contract for the CONSTRUCTION of a COVERED SERVICE RESERVOIR to hold 3,000,000 gallons at Moorhouses, in the Borough of Tynemouth.

The drawings may be seen at the Office of the Engineer, Mr. JAMES MANSERGH, 5, Victoria-street, Westminster, or at the Office of the Borough Surveyor, Howard-street, North Shields, on and after MONDAY, the 19th inst.

Specifications and bills of quantities, &c. may be obtained at the same time and places on the deposit of cheque or bank note for 5*l.* which will be returned after the receipt of a boná-fide Tender with the bills, &c. fully priced out.

Early application for particulars is desirable, as only a limited number will be given out.

Sealed Tenders are to be delivered at my Office, at or before NOON of MONDAY, the 10th day of JULY next, addressed to me and endorsed "Tender for Moorhouses Reservoir. Contract No. 1."

The Corporation do not bind themselves to accept the lowest or any Tender.

HORATIO A. ADAMSON,
Town Clerk.

Town Clerk's Office,
Tynemouth,
June 12th, 1899.

---

## WESTMINSTER.

SEWER WORKS.
WOOD-PAVING WORKS.

The Westminster Vestry are prepared to receive TENDERS for the EXECUTION of SEWER WORKS and WOOD-PAVING WORKS within their jurisdiction.

The specification and form of Tender in each case may be obtained at the Office of the Surveyor to the Vestry, Mr. G. R. W. WHEELER, between the hours of TEN a.m. and FIVE p.m. (Saturdays, TEN till TWO), upon the deposit of Five Pounds and Two Pounds respectively, which will be returned to those who submit boná-fide Tenders.

Tenders must be made upon the printed forms only, and in strict accordance with the instructions therein contained, and must be delivered to me here, sealed in the envelope supplied, not later than TWO o'clock on WEDNESDAY, JULY 5th, on which day, at FOUR o'clock, parties Tendering may be in attendance.

The contract-deeds will be prepared at the expense of the Vestry, and the respective contractors will be required, together with two approved sureties, to enter into a bond, respectively in the sum of 1,000*l.* and 500*l.* for the due performance of the contracts.

The Vestry do not bind themselves to accept the lowest or any Tender.

By order,
J. E. SMITH,
Vestry Clerk.

The Town Hall,
Caxton-street, Westminster,
June 14th, 1899.

---

## CITY and COUNTY of CANTERBURY.

TO BRIDGE BUILDERS.
STEEL-WORK CONTRACT.

The Canterbury Corporation invite TENDERS for the SUPPLY of the STEEL-WORK—consisting of two Steel Girders 56 feet span (lattice construction) and Steel Trough decking—required for the construction of a new bridge over the River Stour at Canterbury.

Copy plan, sections, specification, and conditions may be obtained on application to the City Surveyor (Mr. A. H. CAMPBELL, A.M.I.C.E.), Tudor Chambers, Canterbury, on deposit of Two Guineas, returnable on receipt of a boná-fide Tender.

Tenders, on prepared forms, to be lodged with me, the undersigned, not later than MONDAY, the 3rd JULY next, at TEN a.m.

The Corporation do not bind themselves to accept the lowest or any Tender.

HENRY FIELDING,
Town Clerk.

Town Clerk's Office,
No. 15, Burgate-street, Canterbury,
June 19th, 1899.

**CONTRACTS** (*continued from p. vi.*)

## COUNTY BOROUGH of BRIGHTON.

TO CONTRACTORS AND OTHERS.

Notice is hereby given that the Council of the said County Borough will receive TENDERS from such persons as may be willing to enter into a contract for the SUPPLY of 4,000 Tons of GRANITE SPALLS or other Hard Stone suitable for breaking up for Road Macadam.

The specifications and forms of Tender may be obtained on application at the Office of the Borough Engineer and Surveyor, Mr. FRANCIS J. C. MAY, Memb.Inst.C.E. at the Town Hall, Brighton.

Sealed Tenders, addressed to me, and endorsed "Tender for Granite Spalls," must be left at my Office, at the Town Hall, before TEN o'clock in the forenoon on FRIDAY, the 30th day of JUNE, 1899.

Power is reserved to reject the lowest or any Tender.

FRANCIS J. TILLSTONE,
Town Clerk.

Town Hall, Brighton,
June 15th, 1899.

## COUNTY BOROUGH of BRIGHTON.

TO CONTRACTORS AND OTHERS.

Notice is hereby given that the Council of the said County Borough will receive TENDERS from such persons as may be willing to enter into a contract for the CONSTRUCTION of CONCRETE GROYNES and SEA-WALLING on the Madeira-road and Foreshore, Brighton.

The plans may be seen, and the specifications and forms of Tender may be obtained on application, at the Office of the Borough Engineer and Surveyor, Mr. FRANCIS J. C. MAY, M.Inst.C.E. F.S.I. at the Town Hall, Brighton.

Sealed Tenders, addressed to me, and endorsed "Tender for Construction of Groynes, &c." must be left at my Office, at the Town Hall, before TEN o'clock in the forenoon on FRIDAY, the FOURTEENTH day of JULY, 1899.

Power is reserved to reject the lowest or any Tender.

FRANCIS J. TILLSTONE,
Town Clerk.

Town Hall, Brighton,
June 19th, 1899.

## COUNTY BOROUGH of BRIGHTON.

MARINE PARADE FORESHORE.
CONCRETE GROYNES AND WALLING.

Contractors desirous of tendering for the above work can obtain BILLS OF QUANTITIES upon application to the undersigned.

SIMEON HUNT, 129, Queen's-road, Brighton.
E. WALLIS LONG, 54, Old Steine, Brighton.

## COUNTY BOROUGH of DERBY.

The Corporation are prepared to receive TENDERS from Builders and others for the ERECTION of the NEW DEPOT, Nottingham-road.

The contract will be divided into two parts—"Substructure" and "Superstructure"—and a separate Tender will be required for each part.

Plans can be seen, and specifications and bills of quantities obtained, on application at the office of Mr. JOHN WARD, Borough Engineer; Babington-lane, Derby.

A deposit of One Guinea must be made for each set of quantities, and same will be returned on receipt of a bonâ-fide Tender, with the quantities fully priced out.

Tenders for each part, endorsed "New Depot, Tender for Substructure" or "Superstructure," to be forwarded under cover, in envelopes provided for that purpose, to the undersigned, not later than TWELVE noon on THURSDAY, JULY 6th next.

The Corporation do not bind themselves to accept the lowest or any Tender, nor to accept the same contractor for both parts.

H. F. GADSBY,
Town Clerk.

Town Clerk's Office,
Town Hall, Derby,
June 13th, 1899.

## SOUTHGATE URBAN DISTRICT COUNCIL.

TO SEWER CONTRACTORS.

TENDERS are invited by the Council for the CONSTRUCTION of a SEWER from Blind-lane to Barrowell Green within the Council's District.

The sewer will consist of stoneware pipes, varying in size from 21 inches to 9 inches, with a cast iron syphon, manholes, flushing chamber, &c.

Plans and specifications may be seen on and after MONDAY next, the 26th inst. on application to the Council's Surveyor, Mr. C. G. LAWSON, from whom copies of the specifications, quantities, and forms of Tender may be obtained on depositing a Bank of England Note for 5*l*. which will be returned on receipt of a bonâ-fide Tender.

Tenders, endorsed "Sewer," must reach the undersigned not later than TUESDAY, the 4th day of JULY, 1899.

The Council do not undertake to accept the lowest or any Tender.

W. M. ELLENOR,
Clerk.

Council Offices, Palmer's Green, N.
June 19th, 1899.

## CONTRACTS (*continued from p.* viii.).

### LEYTON URBAN DISTRICT COUNCIL.

TO CONTRACTORS AND OTHERS.
PRIVATE STREET WORKS.

The Leyton Urban District Council invite TENDERS for MAKING-UP, PAVING, and KERBING certain PRIVATE STREETS within their District. The paths are to be paved with Patent Indurated Stone and Patent Adamant Stone respectively.

Specifications, quantities, and form of Tender may be obtained, on and after MONDAY, the 26th inst. of Mr. WILLIAM DAWSON, M.Inst.C.E. the Council's Surveyor, at his Office, Town Hall, Leyton, between the hours of TEN and FOUR (Saturdays, TEN and TWELVE) upon payment of One Guinea, to be returned on receipt of bonâ-fide Tender.

Sealed Tenders, in special endorsed envelopes supplied with the forms, accompanied by a 10*l.* Bank of England note, to be enclosed with the Tender and to be forfeited if the Tender is withdrawn before the contract is signed, must be delivered at the Meeting of the Council to be held on TUESDAY, the 4th JULY, at the Town Hall, Leyton, at SEVEN o'clock p.m.

The Council does not bind itself to accept the lowest or any Tender.

Sureties will be required for the due performance of the Contract.

R. VINCENT,
Clerk to the Council.

Town Hall, Leyton,
June 17th, 1899.

---

### CHIPPING NORTON CORPORATION.

WATER WORKS EXTENSION.

The Town Council of the Borough of Chipping Norton, are prepared to receive TENDERS for the EXECUTION of certain works, partly within and partly without the said Borough, comprising the SUPPLY and LAYING of about 2,700 yards of CAST-IRON PIPES, principally 4-inch, and 600 yards of small WROUGHT-IRON PIPES, with Valves and special Castings, Stoneware Pipe Drains, the Erection of a small Pumping House, with Wheel Race, Culvert Tanks, &c.

Plans may be seen, and other information obtained, at the Town Clerk's Offices, Chipping Norton, where also copies of the specification, approximate quantities, and form of Tender will be supplied on payment of Two Guineas, which sum will be returned on receipt of a bonâ-fide Tender.

Sealed Tenders, endorsed "Water Works Extension," must be delivered to my Offices on or before the 17th day of JULY, 1899.

Contractors Tendering must do so at their own expense, and all Tenders will be subject to the approval of the Local Government Board being obtained for the intended works.

The lowest or any Tender will not in any case necessarily be accepted.

THOS. MACE,
Town Clerk.

Town Clerk's Office, Chipping Norton.
June 17th, 1899.

---

### BOROUGH of LOWESTOFT.

ELECTRIC LIGHTING.
ELECTRIC LIGHT STATION.

The Mayor and Corporation of the Borough of Lowestoft are prepared to receive TENDERS for the ERECTION of an ELECTRIC LIGHT STATION.

Specification, with general conditions, bills of quantities, and form of Tender may be obtained at the Offices of the Architect, Mr. ALBERT E. PRIDMORE, 2, Broad-street-buildings, London, E.C. on and after JUNE 28th, on payment of Five Guineas, which sum will be returned on receipt of a bonâ-fide Tender.

Detail drawings can be seen at the Offices of the Architect, or at the Borough Surveyor's Office, Lowestoft.

Tenders, sealed and marked "Tender for Electric Light Station," to be delivered to the Town Clerk, at the Town Clerk's Offices, 115, High-street, Lowestoft, on or before TWELVE o'clock noon, on the 18th JULY, 1899

The Corporation do not bind themselves to accept the lowest or any Tender.

(Signed) R. BEATTIE NICHOLSON,
Town Clerk.

No. 115 High-street,
Lowestoft.

---

### PLYMOUTH CORPORATION.

SEWERAGE WORKS, 1899.
CONTRACT NO. 2.
TO ENGINE AND PUMP MAKERS.

The Corporation of Plymouth are prepared to receive TENDERS from competent persons willing to enter into a contract for the MAKING, ERECTING, and SETTING TO WORK of TWO HORIZONTAL GAS or OIL ENGINES, Two Sets of Vertical Two-Throw Ram Pumps, connected to same with Gearing and Friction Clutches, Two Dry Gas-meters, all Gas, Water-circulating, and Exhaust Pipes, Two Circulating-water Tanks, Silencers, Hand-railing, and Floor-plates.

Each Engine, with its set of pumps, is to be capable of raising 1,200 cubic feet of sewage per hour to a height of 28 ft. (exclusive of friction) through 450 ft. of 6-in. diameter rising main.

The drawing may be seen, and copies of the specification and form of Tender obtained, at the Office of the Engineer, Mr. JAMES MANSERGH, 5, Victoria-street, Westminster, on and after MONDAY, the 26th inst. on the deposit of cheque for 2*l.* which will be returned after the receipt of a bonâ-fide Tender, with the bill of particulars fully priced out.

Early application is desirable, as only a limited number will be given out.

Sealed Tenders, endorsed "Pumping Machinery," are to be delivered at my Office at or before NOON on THURSDAY, the 13th day of JULY, 1899.

The Corporation do not bind themselves to accept the lowest or any Tender.

By order,
J. H. ELLIS,
Town Clerk.

Municipal Offices,
Plymouth,
June 22nd, 1899.

---

### THE VESTRY of the PARISH of ST. MARY, BATTERSEA.

NEW PUBLIC BATHS AND WASHHOUSES.
CAST-IRON COLUMNS AND IRON ROOFS, &c.
IRON TANK AND COVER.

The Vestry are prepared to receive TENDERS for the SUPPLY and FIXING OF

CAST-IRON COLUMNS and IRON ROOFS, &c. and IRON TANK and COVER, required in connexion with the provision of their new Baths and Washhouses in Battersea Park-road.

Specification and forms of Tender and contract can be obtained, and the drawings inspected, upon application at the Municipal Buildings, Lavender-hill, S.W. between the hours of TEN a.m. and FOUR p.m. (Saturdays TEN a.m. to TWELVE noon).

Tenders, sealed, and marked on the outside "New Baths and Washhouses—Tender for ——," must be addressed to the undersigned, and delivered at the Municipal Buildings not later than TWELVE o'clock noon on WEDNESDAY, the 5th JULY, 1899.

The contract will be prepared by, and at the expense of, the Vestry.

Persons tendering will be required to declare in their Tender that they pay the Trade Union rate of wages, &c. and must append to the Tender a schedule of the wages paid to the various classes of workmen employed by them at the time of tendering.

The Vestry do not bind themselves to accept the lowest or any Tender.

By order of the Vestry,
W. MARCUS WILKINS,
Vestry Clerk.

Municipal Buildings,
Lavender Hill,
June 22nd, 1899.

**SPECIFICATIONS FOR BUILDING WORKS,** AND HOW TO WRITE THEM: a Manual for Architectural Students. By FREDERIC RICHARD FARROW, F.R.I.B.A.

The Chapter on Terra-Cotta by THOS. COOPER, A.R.I.B.A. and that on Electric Wiring, by ALEX. RUSSELL, M.A. (Cantab.), Lecturer to Faraday House, and NEVILLE T. PAYNE, A.I.E.E.

This Manual is written with a view to meet the requirements of the student, to show him how he should write a specification, so that when he has learnt the method and general principles, he may apply them to the particular exigencies of any building he may design.

"Every architect who takes pupils should insist that they obtain copies."—*Architect.*

"Will prove of service to the architectural student."—*Building News.*

"Full of practical hints and advice—has a good index."—*A. A. Notes.*

"Well fulfils a useful purpose."—*Glasgow Herald.*

"A handy manual—will be found extremely useful in the early days of student life."—*Liverpool Courier.*

Uniform with the above, 5s. post free.

**CARPENTRY AND JOINERY:** a Text-Book for Architects, Engineers, Surveyors, and Craftsmen (with over 420 illustrations), by BANISTER F. FLETCHER, A.R.I.B.A. and H. PHILLIPS FLETCHER, A.R.I.B.A., A.M.I.C.E.

The Authors have endeavoured to meet the requirements of the craftsman, and at the same time to produce a work that will be useful to the Professional man in the designing of the various structures. They have also endeavoured to consider the desires of those who are likely to become candidates for the examination of the City and Guilds Institute, the Carpenters' Company, and the Institute of Certified Carpenters, &c. Also for the examination in these subjects by the R.I.B.A. and the Surveyors' Institution, &c.

"Can be heartily recommended."—*A. A. Notes.*

"A concise treatise."—*Scientific American.*

"Admirably adapted for its intended purpose."—*Carpenter and Builder.*

"A very useful volume."—*English Mechanic.*

"Thoroughly practical and up-to-date."—*Irish Builder.*

"Of the utmost value to the student."—*City Press.*

## WOOD BLOCK FLOOR LAYING.

Builders' own Blocks laid in our Special Composition and carefully dressed off. Or floors laid complete in any wood, with superior blocks, tongued and grooved on our own system.

*Estimates and particulars on application.*

**T. J. BOURKE & CO.**, Wood Block Flooring Contractors, VALLENTIN-RD., WALTHAMSTOW, LONDON.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

ESTABLISHED A.D. 1774.

**AUSTIN'S NEW IMPERIAL PATENT**

SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The manufacturers would recommend it for its strength, and the large amount of wear in it, consequent upon its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above article particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over 100 years, and the proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the Trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors, and Wholesale Houses in Town or Country.

N B.—Please note that all our Goods as advertised above are labelled either inside or outside with the Trade Mark the "Anchor."

## LIFTS.

# STIFF'S SEWER-AIR EXCLUDING TRAPS

Stiff's "INTERCEPTER" & "WEAVER" SEWER-AIR TRAPS afford perfect VENTILATION of the HOUSE-DRAIN as well as a STRONG and EFFECTIVE WATER SEAL against the entrance of FOUL-AIR from the STREET SEWER or CESSPOOL.

Stiff's "KENSINGTON" and "WEATHERLY" GREASE and SINK TRAPS effectually TRAP and DISCONNECT all Sink, Bath and Cistern Waste Pipes from the HOUSE DRAIN and SEWER.

Stiff's QUICK FLUSH TRAP, LIGHT'S Patent, is constructed with a Deep-Water Seal and so shaped as to offer a minimum resistance to the passage of the sewage into the drain.

"LIGHT'S" QUICK FLUSH TRAP. "KENSINGTON" GREASE TRAP. "WEAVER" VENTILATING TRAP

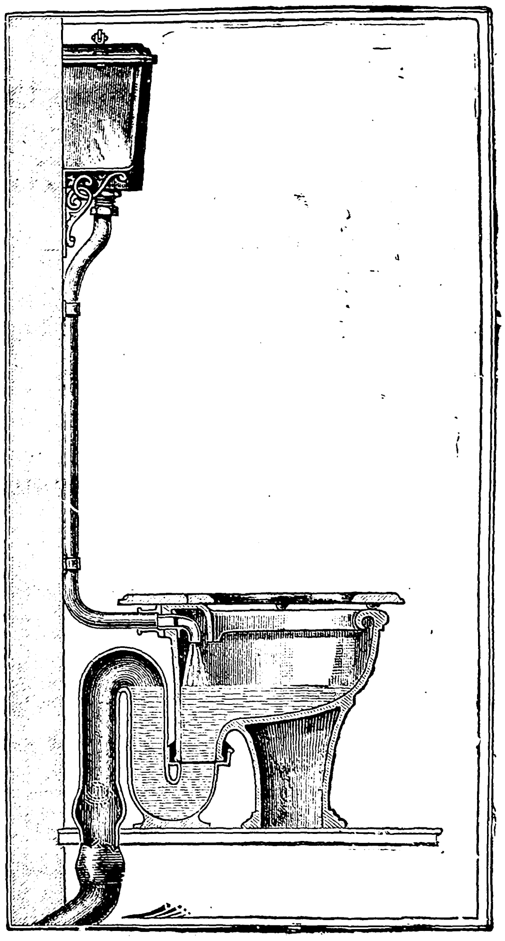
It cannot go out of order.
It has no Second Trap.
It has no Joints on Drain Side of Trap.
It is fitted with PERFECTO Seat for greater cleanliness—no connection with wall.

**Most undoubtedly the BEST, CHEAPEST, & SIMPLEST SIPHONIC CLOSET EXTANT.**

*Write for Prices and full particulars.*



## SALES BY AUCTION.

By order of the Trustees of the St. Clement Danes Holborn Estate Charity, High Holborn.—Letting on Building Leases of Valuable Sites for Shops, Trade Premises and Dwellings.

**THURGOOD & MARTIN have received** instructions to LET by AUCTION, on Building Leases, on WEDNESDAY, 28th JUNE, 1899, at TWO o'clock precisely, in Three Lots, Nos. 101 to 104, High Holborn, and neighbouring PLOTS of LAND on the east and west sides of Dean-street, well situate in and near the main thoroughfare from the City to the West End, in one of the busiest and widest parts, having areas varying from 7,374 ft. to 3,121 ft. respectively. Very valuable sites for important shops, warehouses and dwellings.—Particulars and conditions of letting, with plans, may be had of Messrs. J. C. & W. W. ISAACSON, Solicitors, 11, New-inn, Strand, W.C.; H. C. BOYES, Esq. Ormond House, Great Trinity-lane, E.C. Architect and Surveyor to the Trustees; at the place of sale; and of the Auctioneers, 27, Chancery-lane, W.C.

---

**MESSRS. CHURCHILL & SIM'S next** PUBLIC SALE will take place at the GREAT HALL, WINCHESTER HOUSE, Old Broad-street, E.C.

On WEDNESDAY, JUNE 28th, 1899,

at TWELVE o'clock precisely, with an assortment of DEALS, BATTENS, BOARDS, TIMBER, &c.

Catalogues of

**CHURCHILL & SIM,** { Wood Brokers, 29, Clement's-lane, E.C.

---

HARINGEY PARK, CROUCH HILL (outside the jurisdiction of the L.C.C.).—FREEHOLD BUILDING ESTATE of five acres, three minutes from the Broadway and five minutes from the station. Ripe for immediate development for the erection of houses that readily let and sell.

**WEATHERALL & GREEN will SELL** by AUCTION, at the MART, E.C. on MONDAY, JULY 3rd, at TWO o'clock, in One Lot, the FREEHOLD BUILDING ESTATE of over five acres in extent, upon which at present stand Nos. 13 to 28, Haringey Park, now let, and producing 1,070*l.* 10s. per annum. This area of five acres is all matured land, surrounded by good roads, and ripe for the immediate creation of freehold ground-rents, as about 2,000 ft. of building frontage can easily be dealt with, and there also is the advantage to the purchaser of the income from the existing rents, which will be receivable until the scheme of development has been matured and the sites cleared. The district is high and healthy, and modern houses are in great demand. A. P. RODYK, Esq. Solicitor, No. 70A, Aldermanbury, E.C.—Particulars at the Mart, and of the Auctioneers, 22, Chancery-lane.

---

LINDFIELD, Sussex.—1¼ miles from Hayward's Heath Station, whence there is a capital 'bus service.

**MESSRS. DRAWBRIDGE & ANSELL** have received instructions to SELL by AUCTION, at the "BENT HOTEL," LINDFIELD, on WEDNESDAY, JULY 5th, 1899, at SIX o'clock in the evening, 13 valuable FREEHOLD BUILDING PLOTS (immediately adjoining this quaint and picturesque town, with its unrivalled common and pretty pond, and which is well known for its healthy situation and beautiful surroundings), ripe for the immediate erection of detached or semi-detached villas, which are greatly in demand in this locality.—Particulars, with plans and conditions of sale, may be had of Messrs. DRAWBRIDGE & ANSELL, Auctioneers, Estate Agents, and Timber Valuers, Hayward's Heath, Sussex.

---

CITY OF LONDON.

City Improvements.—By order of the Corporation.

To Brewers, Licensed Victuallers, Restaurateurs, and others. Offering an opportunity of securing one of the finest sites for licensed premises.

In the heart of the shipping, wine, Colonial, and corn trade centres.

The valuable Free LEASE of the important corner Building Site, together with the License thereto attached, now occupied by fully-licensed premises, the Mercantile, and the adjoining property known as 126, Fenchurch-street, E.C.

Having a frontage of about 36 ft. 5 in. to Fenchurch-street, and about 43 ft. 2 in. to Fen-court, which is now being widened, and will form an important thorougfare, with an enormous pedestrian traffic, the whole covering an area of about 1,374 square feet. A free lease for 65 years will be granted at the moderate ground rent of 300*l.* per annum.

**MESSRS. DOUGLAS YOUNG & CO.** will SELL the above by AUCTION, at the MART, E.C. on WEDNESDAY, JULY 19th, 1899, at ONE o'clock precisely.—Plans, particulars, and conditions of sale may be obtained of the Comptroller or the City Engineer, Guildhall, E.C.; or of the Auctioneers, No. 51, Coleman-street, E.C.; 213, Clapham-road, S.W.; and Ilford, E.

---

MONDAY, JULY 10, 1899.—TELSCOMBE CLIFFS LAND SALE, between Brighton and Newhaven.—160 Choice Seaside BUILDING SITES WILL BE SOLD in a MARQUEE on the Estate, at HALF-PAST TWO p.m. Payments by instalments. A special train of first-class carriages will leave Victoria at 10 5 and London Bridge at 10, calling at Clapham Junction and East Croydon; Return Tickets, including Luncheon, 5s. may be had of the Auctioneers.

**MESSRS. HARMAN BROS. have been** favoured with instructions from the CAVENDISH LAND CO. Ltd. to SELL by AUCTION the Third Portion of the above Estate, on MONDAY, JULY 10, at HALF-PAST TWO.—Particulars and plans may be had of Messrs. WARD, BOWIE, & CO. Solicitors, No. 7, King-street, E.C.; of Messrs. HOOKER & WEBB, 4, High-street, Croydon; of Messrs. FAIRBROTHER & CO. 26, Queen's-road, Brighton; of the CAVENDISH LAND CO. Ltd. 68, Victoria-street, Westminster; and at the AUCTIONEERS' Offices, 75, Aldermanbury, Guildhall, E.C.

---

TOTTENHAM (close to Bruce-grove Station).—A small Freehold Building Estate, undoubtedly ripe for immediate development, and a Detached Residence, with stabling and large gardens.

**MR. ALFRED RICHARDS will SELL** by AUCTION, at the MART, E.C. on TUESDAY, JULY 4th, at ONE, in Two Lots, the valuable DETACHED FREEHOLD RESIDENCE, known as "The Woodlands," Lordship-lane, Tottenham, with capital stabling and outbuildings; tennis, croquet lawns, large and productive garden. With possession. Also the ripe FREEHOLD BUILDING ESTATE adjoining, and comprising a little over five acres, with the important frontage of 523 ft. to Lordship-lane. It is within a few yards of the Bruce Castle Park, in a neighbourhood where extensive public improvements are being carried out, and where the demand for a good-class villa is unlimited.—May be viewed, and particulars obtained of Messrs. GUSH & CO. Solicitors, 3, Finsbury-circus, E.C.; and of the Auctioneer, 18, Finsbury-circus, and Tottenham.

---

GREEN-LANES, WOOD GREEN, N.—166 Lots of exceedingly valuable FREEHOLD BUILDING LAND, free from tithe and land tax, in a rapidly increasing, convenient, and accessible district, near Green-lanes Station on the G.E.R. and Hornsey Station on the G.N.R. the cars of the N.M. Tramway Company passing the estate, comprising a commanding corner site, having an important frontage to the Green-lanes, suitable for the erection of business premises; and 165 Plots, with frontages to Westberry-avenue and the new roads leading therefrom, affording choice sites for the erection of villa residences, which are greatly in demand, and the property being fully ripe for building operations offers an excellent opportunity for the creation of ground-rents. Also One Lot with a paddock in the rear. FOR SALE by AUCTION, on behalf of

**THE BRITISH LAND COMPANY,** Limited, at the MANOR HOUSE TAVERN, Green-lanes, Finsbury Park, on THURSDAY EVENING next, JUNE 29th, at SIX for SEVEN o'clock. Free conveyances. Possession on payment of 10 per cent. deposit, balance payable by easy instalments extending over nine years.—Particulars, plan, and conditions of sale may be obtained of the SECRETARY, 25, Moorgate-street, E.C.; and at the Place of Sale.

---

Apsley End, Hemel Hempstead, HERTS.—Important SALE of FREEHOLD BUILDING LAND with frontage to the main road, and other plots fronting new roads, where sewers will be put in by the vendor; also many plots adjoining the river which is a carrier to the canal.—This property is near the Paper Mills and within about one mile of Boxmoor Station, suitable for artisans' houses and factories, FOR SALE by AUCTION, by

**MR. N. W. ROBINSON, in JULY, 1899,** by order of the Proprietor.—Particulars, plans, and conditions of sale can be obtained, when ready, of the Auctioneer, 66, Marlowes, Hemel Hempstead.

---

Completion of the Works, Aberdare-gardens, South Hampstead.—Important SALE of the excellent, nearly new BUILDING PLANT and MACHINERY, consisting of a 14-h.p. double cylinder portable engine and a 12-h.p. portable engine by Ruston, Proctor, & Co. 12-in. three-cutter planing machine by Reynolds, a new 30-in. circular saw bench by Butler, hand and power mortising machines by Reynolds, general jointer by Worssam, 9-ft. mortar mill by Sykes, a circular saw bench, belts, pulleys, and shafting, 600 scaffold-poles, 150 dozen putlogs, ladders, 200 dozen scaffold boards, 150 dozen scaffold cords, falls, benches, barrows, truck, flooring, joinery and other timber, poling boards, two offices, large workshop and engine shed, bottle-jacks, floor dogs, pulley wheels, five nearly new spring tip carts, nearly new builder's van, spring timber lorrey, three very fine powerful cart horses, five sets of cart and chain harness, quantity of firewood and useful effects.—

**MR. ERNEST OWERS will SELL by** AUCTION, upon the LAND in the rear of the new buildings, as above, on THURSDAY, JULY 13th, at ONE o'clock.—Catalogues (when ready) of the Auctioneer, Finchley-road (L. and N.W.) Station and West Hampstead (Metropolitan) Station.

---

**MR. ERNEST OWERS begs to draw** special attention to the excellent Machinery and Engines included in the above SALE; also the three very fine powerful CART HORSES, 16 to 17 hands.

---

TO BUILDERS AND SPECULATORS.—By order of the Mortgagee.—HANWELL, TWELVE well-built CARCASES (eight roofed on), known as Nos. 26 to 48 (even), Shirley-gardens, just off the main Uxbridge-road, containing three bed, bath, and two sitting-rooms, kitchen, scullery, forecourts, and gardens, estimated to readily let at 26*l.* per annum each when completed, tenants paying taxes, this class of property being in great demand. Leases 99 years. Ground rent 5*l.* 10s. each.

**MR. ERNEST OWERS will SELL by** AUCTION at YE OLDE HATTE HOTEL, Uxbridge-road, Ealing Dean (close to the property), on WEDNESDAY EVENING, JUNE 28th, at SEVEN o'clock precisely.—Particulars and conditions of Sale of Messrs. FLADGATE & CO. Solicitors, Craig's-court, Charing Cross, and of the Auctioneer, Finchley-road (L. & N.W.) Station, and West Hampstead (Met.) Station, N.W.

---

WESTCOTT, near DORKING.—Land in Small Plots or Cottage Property. Free conveyances.

**MESSRS. WHITE & SONS are favoured** with instructions to SELL by AUCTION, on THURSDAY, JULY 6th, 1899, at the RED LION HOTEL, Dorking, the FIRST PORTION of the COAST HILL FIELD, Westcott, in numerous Plots, with frontages of from 20 ft. and depths of 100 ft. or thereabouts, for the erection of cottage property. The soil is light, the situation high and healthy, and the Dorking Water Company are able to serve the Estate.—Particulars, with plans and conditions of sale, may now be obtained of F. DOUGLAS ALLOWAY, Esq. Solicitor to the Vendor, Lincoln's Inn Fields, London, W.C. and Dorking; or of Messrs. WHITE & SON, Auctioneers and Land Agents, Dorking and Leatherhead.

---

WHITSTABLE-ON-SEA, Kent.—SALE of valuable BUILDING LAND close to the sea in the centre of the Town. Dwelling-houses, shares of ships and gas shares, part of the estate of the late James Reeves, deceased.

**MR. J. T. REEVES will SELL the above** by AUCTION, at the AUCTION MART, Whitstable, on THURSDAY, JUNE 29th, at TWO p.m.—Particulars and conditions of J. F. WHICHCORD, Esq. Solicitor, or the Auctioneer, Whitstable.

*Refer also to* "TOO LATE" *column, page* xxiv.

---

**LAND WANTED, not less than 6 acres,** for a manufacturing site. Must be on siding or adjoining goods station on main line. Low rates, good water supply, and plenty of cheap cottages are important features. Canal or river would be an attraction. Must be within about one hour from London, less preferred.—Full particulars to Box 194, Office of "The Builder."

---

**FREEHOLD BUILDING LAND TO BE** LET or SOLD near to Muswell Hill Station.—For particulars apply to Mr. HAYTER, 84, Temple-chambers, Temple-avenue, E.C. or to Mr. W. H. RUSSELL, Alexandra Park-road, Muswell Hill, N.

---

**TO BUILDERS.—FREEHOLD LAND** at Clacton-on-Sea, ripe for building immediately; seven 50 ft. plots in Pier-avenue, close to pier; three 75 ft. plots Skelmersdale-road, close to railway station; also plots in Walton-road, Connaught-gardens, &c.; TO BE LET on building lease, with option to purchase; or the FREEHOLD TO BE SOLD.—Apply to

BISLEY & SONS,
No. 63, King William-street, City.

---

---

**SUTTON, SURREY. — FREEHOLD** BUILDING PLOTS, with frontages of 20 feet and depths of 110 feet, in most eligible situation on high ground. Price 100*l.* per plot or 5*l.* per plot on building leases. Liberal advances and improvement to respectable builder.—Full particulars of BOYTON, PEGRAM, & BUCKMASTER, Broadway, Walham Green, S.W.

---

**WIMBLEDON HOUSE ESTATE**

COMPANY, LIMITED.

The Directors are prepared to receive PROPOSALS for the SALE or LETTING of SITES for Private Houses on this property, which is being developed by the Company as a high-class Residential Estate.

The land lies high with a deep gravel subsoil, and has a frontage of over half a mile to Wimbledon Common and is well timbered.

The Estate which until lately was the residence of the late Sir Henry Peek, is situated in the best part of this much sought after suburb, and commands extensive views over the Common to the Surrey Hills, and the excellent service of trains makes it peculiarly convenient to gentlemen whose pursuits command their presence in London.

Plans and further particulars may be had by applying to the Secretary, at the Estate Office, Parkside, Wimbledon, or to the Surveyor, GEORGE HUBBARD, F.R.I.B.A. 85, Gresham-street, E.C.

---

**FOR SALE, BRICK WORKS and Three** COTTAGES; an unlimited supply of clay, no expense raising, burning capital bricks; works supplied with necessary machinery for brick, tile, and pipe, in full working order, ready sale for all articles made. Intending buyers invited to visit the works, Stow, Kimbolton.—Apply, MANAGER, Brick Works, Stow, Kimbolton.

---

**VINEYARD BRICK WORKS, Musley**-lane, Ware, Herts, TO BE SOLD, by order of the Executrix of the late Mr. T. B. Lyne, comprising 6a. 2r. 24p. together with the goodwill, machinery, plant, and utensils. The whole in good order and ready for immediate use. The property is freehold, and the output can be made to 2,000,000 a year.—Particulars of STIMSON & SONS, Auctioneers, 8, Moorgate-street, E.C. and 2, New Kent-road, S.E.

---

**SURREY HILLS.—FREEHOLD SITE** for a Country Residence, 9½ acres, FOR SALE, 15 miles from City, 1½ miles from railway station. Beautiful situation on high ground, with lovely timbered surroundings. Water laid on. Gravel and chalk subsoil. Most healthy position. Lodge built. Grounds partly laid out and planted. Price 1,600*l.* or a residence would be built to suit requirements and let on long lease.—Apply to C. & F. RUTLEY, Architects, 11, Dowgate-hill, E.C.

---

**BRICK WORKS, about 35 acres freehold,** close to London. Clay inexhaustible, now making excellent sand facings and wire cuts. An exceptional opportunity of acquiring a genuine going concern which offers unlimited means of extension.—Apply to the Messrs. LUMLEYS, of St. James's House, 22, St. James's-street, London, S.W.

---

**TO BE LET, with possession, adjoining the** high road to Wolverton, about half-a-mile from the market town and station of Newport Pagnell where there is an excellent opening for a builder, PREMISES, comprising a large timber shed, workshop, blacksmith's shop, stable, cartshed, and other accommodation for carrying on an extensive builder's business, together with a good, modern, double-fronted dwelling-house, containing two sitting-rooms, office, four bedrooms, kitchen, scullery, and pantry. Or the property would be sold.—DURHAM, GOTTO, & SAMUEL, Land Agents, Newport Pagnell.

---

**BUILDING LAND TO BE LET, at** Balham, where there is a great demand for weekly houses. Liberal advances. Also for shops and flats at Camberwell, Peckham, and Maida Vale.—WALTER STAIR, 9, Queen Victoria-street.

---

**FREEHOLD BUILDING SITE, South** Kensington.—Splendid CORNER SITE, with three frontages, comprising about 10,590 superficial feet, suitable for residential flats.—Write for interview to ARTHUR BLACKFORD, Surveyor, 61, Chancery-lane, W.C.

---

**FLATS (self-contained), West End, new.** Three to eight rooms, bath-rooms (hot and cold); central gardens and tennis courts free. Rents, 32*l.* to 110*l.* including taxes.—W. H. GIBBS & CO. 5, West Kensington-terrace (nearly opposite West Kensington Station), W.

---

**BEDFORD PARK, W.—FREEHOLD** BUILDING LAND, in good positions, with frontages to existing roads, TO BE LET on Lease.—Apply, Messrs. V. BUCKLAND & GARRARD, Surveyors, 8, Frederick's-place, Old Jewry.

---

**LAYSTALL-STREET, Rosebery-avenue.**—FREEHOLD LAND TO BE SOLD or LET on building lease, area. 2,600 ft. Good light front and back.—Apply, to Messrs. V. BUCKLAND & GARRARD, 8, Frederick's-place, Old Jewry, or H. H. COLLINS, Esq. Architect, 61, Old Broad-street, E.C.

---

**TO BUILDERS or SHOPFITTERS.—** Well-lighted BASEMENT, 26 by 15, TO BE LET, good centre, close Moorgate-street. Low rent. Capital opening, or for City address and branch.—To view, apply Mr. TEWSON, 72, Finsbury Pavement.

---

**LOWER EDMONTON. — ELIGIBLE** FREEHOLD BUILDING LAND TO BE SOLD, suitable for Artisan's Dwellings, &c. for which there is great demand. Financial assistance given to respectable builders.—Apply CORNWALLIS ESTATE, Bounce-road, Lower Edmonton, N. or write B. 107, Nightingale-road, Wood Green.

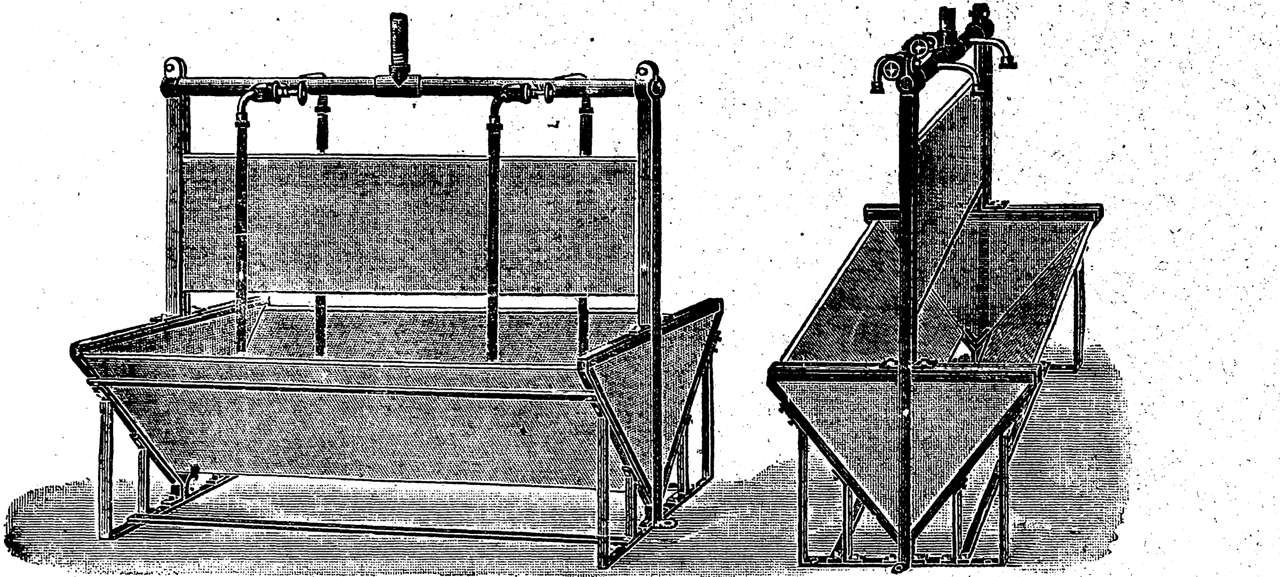
## REGISTERED "CRYSTAL" LAVATORY

WITH RUNNING STREAM. (Registered No. 328,992).



Frame made entirely of **WROUGHT IRON.** With **CAST PLATE GLASS** sides, ends, and division.

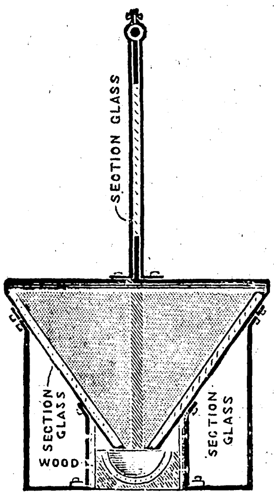
FOR USE IN

## *OPHTHALMIC INSTITUTIONS, SCHOOLS, REFORMATORIES, WORKHOUSES, etc.,*

OR ANY PLACE WHERE MANY PERSONS HAVE TO WASH IN A SHORT SPACE OF TIME.

**Two persons cannot use the same water, and one person cannot use the same water twice.** This effectually prevents the spread of ophthalmia or any other contagious disease.

The water, when used, falls into the glass trough, and thence into the channel, and right away into the drain. The sides, being perfectly smooth, prevent dirt or other matter clinging to same.



SECTION CHANNEL & CONCRETE.
SECTIONAL VIEW WHEN FIXED.

## INSTRUCTIONS FOR FIXING.

The channel should be fitted into a bed of concrete; provision is made at each side of bottom for screwing a board; the space between the boards should be filled with concrete and the channel bedded into same. After the concrete sets, the boards may be removed and the concrete sides faced.

The channel may be of Lead or White Glazed Earthenware; the latter is recommended.

The water can be supplied at any desired temperature by using a "Hot" and "Cold" Combined Mixing Box, which can be regulated by an attendant.

The Mixing Box can be supplied with a thermometer, to indicate the temperature at which the water is passing. Where cold water only is required, a wheel valve is most suitable.

Each Jet can be fitted with a Stop Valve, if required.

*These Lavatories can also be made to fix against a wall.*

**PRICES AND FURTHER PARTICULARS ON APPLICATION.**

*The Design can be altered or varied to suit Architects' requirements.*
